Abstract

This paper attempts to presents a literature review on Agency Theory and its relevance in understanding the relationship between Government and the HEIs. It discusses the general aspects of the theory and also reviewed some previous studies that have applied the theory. Theories as we know help us to accomplish many important outcomes in academia. They help us to organize our thoughts and ideas about the world and also help us generate and explain relationships, complex or otherwise, between individuals or among groups. Theories also help us improve our predictions and expectations about people, groups or organizations, while at the same time giving us a better understanding of the world around us. Attempt has also been made to relate the application of the Principal – Agent theory to Higher Education, especially public universities with regards to their governance and funding. It is a well-known fact that Governments provides the greater part of funds required by the public universities. In this case therefore the Government has some expectations on these universities, especially with regards to the utilization of the funds provided and also the need for accountability, as the funds so provided, is tax payers' money and must therefore be accounted for. The theory is also expected to provide a useful framework for performance funding procedures in the public universities.

Keywords: Higher education, funding, Agency Theory

1. Introduction

One of the earliest descriptions of the principal-agent phenomena was provided by Adam Smith in the book "the Wealth of Nations", where he described a corporate structure in which Owners (Principals) hire or employ Managers (Agents) to manage their corporations for them (Smith, 2005). He posits that since the managers are paid salaries, they do not share in the profits of the corporation directly. This, he believes, will make the managers to care less about their expenses and also care less about their duties, thus having a very high tendency to shirk (Yarmolinski, 2012). This observation by Adam Smith is focused on the fact that agents often have different motivations than their

principals due to their specialized knowledge, which may make it difficult for the principals to monitor or assess their performances (Yarmolinski, 2012). Agency theory thus developed out of the need to investigate general questions on information asymmetry and risk sharing in various types of relationships (Moe, 1984).

According to Spence (1973), the theory was initially focused on the problems or dilemmas of incomplete information in the Insurance Industry, but was soon applied into more general problems with contracts in other contexts (Dewhurst, 2003; Namazi, 2013). The theory is an analytic expression that explains how best to organize relationships between two parties (the principal and the agent), whereby the principal engages the agent to perform some tasks or services for him for a fee (Eisenhardt, 1989; Kivistö, 2007; Waterman & Meier, 1998). The contract between the principal and the agent is based on the premise that the agent possesses the skills, information, qualifications, experience and the ability to perform the required tasks effectively and satisfactorily to the satisfaction of the principal (Kivistö, 2008). The major problem in this relationship, which is the also the central problem of the theory, as presented by Kivistö (2007) is the possibility of the principal establishing effective incentives and information structures that will motivate the agent to produce the desired outcome. Thus the major assumptions in the theory are the existence of information asymmetries and goal conflicts.

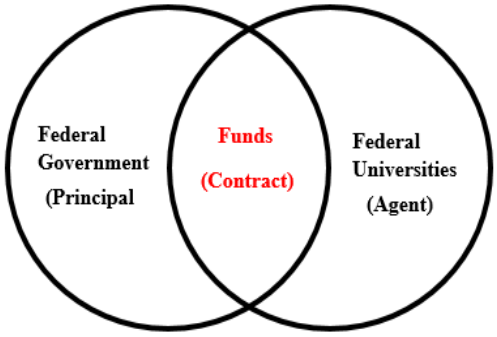
2. The Principal - Agent Contract

The contract between a Principal on the one hand and an agent on the other, can either be explicit (in writing) or implicit (verbal), formal or informal, objective or subjective, and it can be either a complete contract that includes all tasks, activities and contingencies, or it can be an incomplete contract that requires specifications for each task, activity and contingency as and when the need arises (Yarmolinski, 2012). A valid contract, according to Miles (2012), is the major determinant of an agency relationship between the principal and the agent and must therefore;

1) set the tasks of the agent, and
2) define the means of compensating the agent.

In the context of this study, the principal-agent relationship is said to exist because the public universities are established and funded by the Federal Government, to fulfill Nigeria's needs of creating, preserving and transmitting knowledge to its citizens, as postulated by Lane and Kivisto (2008). In order to empower the universities to carry out this mission therefore, the government, through the NUC, provides the appropriate funds, thus creating an implied PAT contract (Lane & Kivisto, 2008). A representation of this principal-agent relationship is illustrated in Figure 1 below.

Figure 1: Principal Agent relationship between Government and Public Universities



Source: Adapted from Lane and Kivisto (2008)

As illustrated in Figure 1 above, the contract between the government and the federal universities is an implied contract through the funds provided by the government and accepted by the universities, to provide education according to the former's higher education objectives, as set out in the National Policy on Education from time to time. So as the Government provides funds to the HEIs for their operations, it also expects feedback from these HEIs in the form of improved access, completion and quality graduates (Yarmolinski, 2012). It should however be noted that agency relationship could come in different forms besides the single principal – single agent format (Ahmad & Farley, 2013; Kivistö, 2008; Yarmolinski, 2012). There could also be;

1) multiple principals – single agent (as is obtained between a dentist and his patients), or

2) a single principal – multiple agents (as is the case between employer and employees) (Ahmad & Farley, 2013; Waterman & Meier, 1998).

3. Assumptions in the Theory

As highlighted by Kivistö (2007), the relevance of agency theory will apply to any contractual relationship, due to the occurrence of two things,

1. There must be the existence of a potential for divergence of interests between the principal and the agent (goal conflicts).
2. The principal must have some difficulties in determining the capabilities or actions of the agent. That is, there must be an information asymmetry between the principal and the agent.

3.1 Goal Conflicts

This is one of the central assumptions underlying the Principal – Agent Theory. It is said to exist in any contractual relationship, when there is a divergence of interests between the principal and the agent on a given task, and both prefer a different course of action (Ahmad & Farley, 2013; Ahmad *et al.*, 2012). While the principal's objective in a contract is for the agent to do all that it takes to complete it, the agent on the other hand, it is assumed, will put in minimum efforts in its execution unless, of course, there is an added incentive (Petersen, 1993). Goal conflict therefore arises due to the agent's self interest in maximizing his benefits from the contract at the expense of the principal. As postulated by Kivistö (2005), the higher the probability of goal conflict, the greater the opportunity for the agent to explore his self-interest.

In a public university setting, goal conflicts can be likened to the areas of teaching and researches. While the Government (principal) is funding the federal universities for the teaching of mostly undergraduate studies, the university may choose to use part of the funds for the training of post-graduate students, thus creating a conflict of interest between them. Liefner (2003), deployed the principal-agent theory to HEI funding to promote the use of performance – based funding in public universities. He argued that due to the specialized nature of education, the object of trade of the universities, the Government (principal), cannot effectively monitor their activities. That the only way out is for the Government to use outcome based contracts (as provided by the theory), which is a form of performance – based funding, to monitor the public universities. By this action, he hypothesized that the use of such a funding mechanism will; make those inactive universities (agents) to work harder, and make the universities to avoid projects or programs that have high possibilities of failure.

For the universities to qualify for funding they will have to concentrate their activities in those areas where they expect to be successful, so as to fulfill the formula's criteria for funding (Liefner, 2003). It was therefore suggested that using the principal – agent theory in funding HEIs, the public universities will pay more attention to the needs of their principal, by adjusting and re-aligning their internal organizational structures in tune with the government's requirements, which will qualify them for funds re-allocations.

3.2 Information Asymmetries

Information asymmetries relates to those decisions taken in transactions or relationships where one party has more or has better information than the other. Thus it is said to exist when one of the parties in a contract, has more information about a situation than the other (Ahmad *et al.*, 2013; Akerlof, 1970). This situation has the tendency to create an imbalance of power between the participants, which may lead to an untimely determination. It is a major contributor to shirking and it usually occurs for two main reasons (Kivistö, 2007; Yarmolinski, 2012), thus:

a. When the principal cannot oversee the activities of the agent, thus making it impossible for him to actually know the extent of shirking.
b. When an agent possesses specialized knowledge about some processes and outputs and makes it difficult for the principal, due to his limited knowledge, to assess the effectiveness of the processes used, or the quality of the product produced.

Public Universities (agents), are contracted by the Government (principal) to provide education to the citizenry by providing these Universities with funds. It is therefore the responsibility of the universities, according to Ahmad et al. (2013), to use the necessary skills, information, qualifications and experiences at their disposal, in the discharge of this task. But due to the specialized nature of education, it is difficult for the Government, or for non-experts, to assess the work of the universities, due to their limited understanding of the operations of HEIs. This lack of capacity by the government to monitor the activities of the HEIs, and the fact that such an exercise will be very expensive to do, usually give rise to information asymmetry.

4. Problems in the Principal-Agent relationship

Agency problem is a situation where an agent, who is authorized to look after the interests of his principal, uses that authority bestowed on him for his own personal benefit. Generally in any contractual relationship, the mere presence of information asymmetry alone cannot be a serious problem, as the agent will automatically act according to the dictates of the contract. Likewise, the existence of goal conflict alone, may not be a threat to the relationship if information is available to all parties. In this situation, the principal can quickly identify the opportunistic tendencies of the agent and checkmate it immediately.

The problem however is when information asymmetry and goal conflicts exists sided by side in a contractual relationship (Eisenhardt, 1989). When incentives are imperfectly aligned, conflict of interest is highly inevitable (Eisenhardt, 1989; Yarmolinski, 2012). An agent may be tempted to act on his own personal interest, rather than on the interest of the principal therefore creating a disconnection between his objectives and goals with those of his principal's. Such a situation usually gives rise to two agency problems referred to as 1) Adverse selection and 2) Moral hazard (Eisenhardt, 1989; Kivistö, 2008; Waterman & Meier, 1998). Therefore, according to Eisenhardt (1989), it is now left for the principal to identify an agent that will accomplish his tasks and also compensate him adequately to diligently execute the agreed tasks according to specifications.

4.1 Adverse Selection

This is a pre-contractual problem and it refers to a process whereby an undesired result occurs when a principal and his agent have access to different/ imperfect information (Kivistö, 2005). According to Yarmolinski (2012) and Eisenhardt (1989), adverse selection is said to occur when an agent disguises his true capabilities, intentions and motivations to the principal in order to secure a contract and was adversely selected due to this deliberate misrepresentation. Having being adversely or negatively selected, an agent may be tempted to act selfishly in the contract, thereby increasing the probability of goal conflicts between him and the principal (Ahmad & Farley, 2013).

A principal can however detect or reduce the chances of adverse selection through two processes, 1) signaling and 2) screening. In signaling it is the agent that conveys his capabilities to the principal by revealing some private information about himself, which, according to Spence (1973), can be relied upon by the principal in employing the agent. Screening on the other hand, is a strategy where the principal undertakes to scrutinize the activities and claims of the agent by obtaining references or by conducting tests prior to engaging the agent (Kivistö, 2005).

4.2 Moral Hazard

This is a post contractual problem in an agency relationship. It is said to arise when the principal cannot directly supervise the activities of the agent, and where such supervision will be costly or subject to error (Kivistö, 2005). In this situation, an agent may be tempted to pursue his own interest, contrary to the provisions of the contract, and also at the expense of the principal (Hölmstrom, 1979; Namazi, 2013; Yarmolinski, 2012). Thus when an agent engages in behaviors that may detract the goals of the principal, moral hazard is said to have set in (Eisenhardt, 1989; Yarmolinski, 2012).

Moral hazard can be contained or controlled by the principal through the process of monitoring (behavior- based contract) or by entering into an outcome- based contract with the agent (Kivistö, 2005). Monitoring may include the establishment of a peculiar budgeting system like performance funding, or the establishment of a special reporting procedure (like monthly or weekly reports) (Kivistö, 2005; Lane & Kivisto, 2008). The principal may also engage the services of an independent supervisor to check the behaviors of the agent (Kivistö, 2005), which may likely make the agent to behave according to the dictates of the contract. It should however be noted that, should such monitoring activities prove to be expensive or illogical, then it is better to go into outcome- based contracts where compensations are in line with the agent's actual performances in the contract (Kivistö, 2005). This arrangement is expected to align the preferences of the principal with the interests of the agent, as the agent's rewards are directly dependent upon his performance of the contract (Kivistö, 2005); thus achieving congruence between the principal and the agent (Eisenhardt, 1989).

4.3 Shirking

Shirking is the evasion or the avoidance of performing a defined responsibility as enshrined in a contract. One of the major concerns of the agency relationship is how to align the actions of the agent with the preferences of the principal (Eisenhardt, 1989). Since the agent and the principal are expected to utilize their relationship maximally, it is expected that each will try to maximize his individual benefits from the contract (Davis *et al.*, 1997; Kiewiet, 1991). It is possible for the two parties to have a shared goal, but as pointed out by Ostrom (1999), it is very unlikely that they will ever do so, because as opined by Yarmolinski (2012), it is impossible to have full disclosures or agreements between an agent and a principal, which according to Ostrom (1999), will lead to a temptation to cheat. Shirking is therefore seen as the misalignment between the actions of the agent and the expectations or preferences of the principal due to their differences in the pursuit of their respective expectations in a common contract (Yarmolinski, 2012).

According to Yarmolinski (2012), Shirking can be avoided, or can be curtailed greatly by the principal with proper monitoring of the agent. This act will also improve the efficiency of the agent. Monitoring can come in the form of periodic reports, site visits, reviews and re-evaluations (Lane & Kivisto, 2008). Peer review mechanisms can also be employed by the government to assess the quality of teaching and research in the public universities (Kivistö, 2008). But before introducing the monitoring process, the principal has to weigh the cost implications, as it can be costly, time consuming and sometimes even impossible to undertake, especially where the principal cannot effectively differentiate between value- added and non-value -added behaviors of the agent, which is usually the case in HEIs (Pfeffer & Salancik, 2003; Yarmolinski, 2012). So before engaging the services of a monitoring agent, there is the need to weigh its costs against the potential cost of the effect of shirking. Sometimes, as posited by Yarmolinski (2012), it is better to consider a small

amount of shirking as an acceptable loss, if the cost of preventing it is higher than the cost of allowing it to happen. Also as presented by Yarmolinski (2012), besides the cost element, monitoring may lead to some unintended social consequences like decreased knowledge sharing; inhibited work effort; and resistance behaviors such as cheating etc. Sometimes therefore, monitoring may even lead to, or may actually reinforce the same behavior it is intended to check (Ostrom, 1999; Pfeffer & Salancik, 2003; Yarmolinski, 2012).

4.4 Slippage

When there is a disconnection between the actions of the agent and the preferences of the principal due to a communication breakdown, then slippage is said to occur (Kassab & Voas, 1998). According to Lane and Kivisto (2008), slippage comes into effect as a result of shirking or due to some structural defects in the contract. When the communication chain between the principal and the agent is too long such that the agent may not be able to identify how misinformation sets in, it can give rise to slippage (Nielson & Tierney, 2010; Waterman & Meier, 1998). The existence of multiple principals can also trigger information loss or information overload, which according to Nielson and Tierney (2003), can make an agent to engage in an activity believing same to be in alignment with the preferences of his principal, but which it actually is not.

5. Agency problem in Government – HEIs relationships

Agency problems can be manifested in Government- University relationship in many ways, typical amongst which, according to Kivistö (2005), is when a public university negotiates for funding from the government to execute their core tasks of T&L and R&D. Due to the need for better funding, universities may be tempted to deliberately distort their true capacities and achievements in meeting the set educational objectives of the Government. The government may not be able to identify or detect the true capacities of all the universities to deliver its required educational objectives, thus adversely funding some that might turn out to be incapable of meeting the set objectives.

This asymmetric problem can however be contained when Universities (agents) themselves divulge their true qualities and capabilities in T&L and R&D activities (Kivistö, 2005). Alternatively, the government can screen the universities prior to the release of funds, by reviewing or examining their performance records on indices like academic staff motivation; number and quality of research outputs; adequate and functional learning facilities; and enrollment and graduation rates. Prior to the release of research funds for example, the government can invite the universities to submit the records of their research activities for assessment, before funds for R&D are released (Thomas, 2001).

The problem of moral hazard can be contained in Government- University relationships, according to Kivistö (2005); Kivistö (2008) and Yarmolinski (2012), by establishing quality assurance systems and evaluation processes like accreditation exercises, to curtail the excesses of the universities. Such controls are aimed at providing assurances to the public, that the funds provided by the government (tax payers money) are actually utilized by the public universities according to the wishes and the aspirations of the populace, and also to confirm that the quality of outputs from these universities will serve the country's human development needs appropriately (Kivistö, 2005). In a performance-based funding arrangement of HEIs, Canton *et al.* (2001), and Kivistö (2005), contends that the use of outcome indicators like number of degrees awarded, number of study credits accumulated, number of research publications etc. can be used to monitor the performances of the public universities.

6. Conclusion

The theory, according to Kivistö (2008), is generic in nature and can be applied to not only economics (where it originated), but to other fields of studies and professions like accounting, marketing, public administration, finance etc. The application of the theory to higher education research is very recent and is being explored by researchers gradually, but cautiously. While the works of Kivistö (2007) and McDaniel (1996) linked the theory with HEI governance, Massy (1996),

attempted to link it with HEI budgeting mechanisms. Eisenhardt (1989), therefore contends that the theory can apply to a variety of settings, both micro and macro, as it is not limited to any particular application (Ahmad et al., 2013).
The Federal Government of Nigeria provides resources, contributed by the tax payers, to fund the Federal Universities. Thus there is therefore the need for the government to monitor, not only the performances of this universities, but also their outputs, which are considered as public or social goods (Ahmad & Farley, 2013; Kivistö, 2008). This need to continually monitor the activities of the Federal Universities can best be undertaken through the application of a theoretical framework that is firmly rooted in political economy which, as posited by Ahmad et al. (2013), is sufficiently provided by Agency Theory. Although the application of the theory to Higher education funding studies is very rare, the studies of Kivistö (2008); Rungfamai (2008); Schiller and Liefner (2007) and Ahmad and Farley (2013), have shown that the adoption of the theory to higher education studies is gradually being accepted. Except for the work of Ahmad et al. (2013), the literatures reviewed in relation to the application of agency theory to higher education, applied to the already developed nations of the world. There is therefore the need to apply the theory to the various higher education funding reforms in developing and the less developed economies.

Abstract

The main goal of this study is to analyze the influence of reputational resources on export performance. Therefore, a quantitative methodological approach was used, conducting a descriptive, exploratory and transversal empirical study, having applied a questionnaire to a sample of Portuguese companies exporting footwear. The results support the merits of the RBV theory, indicating that it offers explanatory power. The findings suggest that reputation resources indeed influence on export performance. Therefore, this findings sustain the necessity to invest in this kind of resources as a strategic determinant, which contributes to the growth of small firms in foreign markets. Finally, the main limitation of this study is related to the sample size, since it was difficult to find companies willing to collaborate with this kind of research.

Keywords: reputational resources, export performance, SMEs.

Introduction

In a globalized world, firms' survival and expansion, and the consequent economic growth of countries, is strongly dependent on a better understanding of the determinants that influence their export performance (Sousa, Martínez-López & Coelho, 2008). Thus, analyzing the strategic variables together with the knowledge of the companies' micro-economic reality, contributes to a more aware and efficient measures by the economic agents to meet the challenges and constant changes. However, we acknowledge that in practice many companies are not aware of the true importance of resources and capabilities to maximize their internal and external efficiency and, therefore, are conditioning their growth.

The intangible assets of firms have attracted considerable interest in organizational and strategy research (Barney, 1991). In particular, scholars have focused a great deal of attention on a subclass of intangible assets that is called "social approval assets," because they develop their value from favorable collective perceptions (Pfarrer, Pollock & Rindova, 2010).

The important intangible resources studied in this research are the reputational resources, since it helps distinguish firms from competitors (Peteraf, 1993), reduces information asymmetry, consumer uncertainty and substitutes expensive governance mechanisms. Moreover, reputation has been linked to organizational performance. Therefore, it appears to be a key variable to understand why some organizations outperform others (Boyd, Bergh and Ketchen Jr, 2010).

Indeed, the fundamental question is to understand if these resources contribute to the export performance of the Portuguese small and medium enterprises (SMEs) in the footwear industry.

1. Theoretical Framework

1.1. Export ventures

Export development is of supreme importance since it contributes to the economic increase of nations by enhancing societal prosperity, developing national industries, improving productivity and creating new jobs. At the firm level, through market diversification, exporting presents an opportunity for firms to become less dependent on their domestic market, reach new clients and explore economies of scale and achieve lower production costs while producing more efficiently (Okpara, 2009).

Consequently, exporting is a more attractive way to enter in foreign markets, especially for SMEs, when compared with other alternatives, either joint-ventures or subsidiaries, since it does not have to make substantial resource commitments (Piercy et al., 1998; Dhanaraj & Beamish, 2003; Lu & Beamish, 2002), it is a less risky strategy and it allows greater flexibility by adjusting the export volume in different target foreign markets (Lu & Beamish, 2002).

On one hand, companies initiate their export activity to achieve certain objectives, such as economic ones (increase profits and sales) and/or strategic ones (markets diversification, gain external market share and enhance brand reputation) (Cavusgil & Zou, 1994).

On the other hand, the motivations for export ventures may result from proactive or reactive actions. A proactive orientation reflects an aspiration to create a sustained (long-term) competitive advantage (Porter, 1985). These proactive actions are related with profit advantage, unique products, technological advantage exclusive information, managerial urge, tax benefit and economies of scale. A reactive orientation reflects a short-term perspective with relatively little formal planning. Typically, linked with environmental turbulence, that threatens the organization's current equilibrium. These reactive actions are associated with competitive pressures, overproduction, declining domestic sales, excess capacity, saturated domestic markets and proximity to customers and ports (Wood & Robertson, 1997).

1.2. Intangible resources: reputational resources

The new paradigm of today's world economy is characterized by the mobility of production resources and the ability to combine them in an efficient way. The strategic management research has recognized the importance of studying the companies' resources and capabilities and its usefulness to achieve competitive advantage. This perspective is consistent with the Resource-Based View (RBV).

Scholars argue that resources form the basis of firm strategies (Barney, 1991). Therefore, firm resources and strategy cooperate to create positive returns. Firms employ both tangible resources (such as physical infrastructures and financial resources) and intangible resources (like knowledge and brand equity) in the development and implementation of strategies. However, intangible resources are more likely than tangible resources to produce a competitive advantage, since they are often rare and socially complex, thereby making them difficult to imitate (Hitt, Bierman, Shimizu, & Kochhar, 2001). Thus, intangible resources are considered strategic resources (Amit & Schoemaker, 1993).

Intangibles resources have three intrinsic characteristics that distinguish them from tangible resources (Molloy et al., 2011). First, intangibles do not deteriorate with use, since these resources are expected to confer benefits for an indeterminate period of time (Cohen, 2005). Secondly, multiple managers can use the intangibles resources simultaneously, for example, the use of a brand is available for all managers. Finally, the intangibles resources are immaterial, making them difficult to exchange, as they often cannot be separated from its' owner (Marr & Roos, 2005).

The existing literature suggests six types of resources that are particularly important sources of export venture competitive advantage: reputational resources; access to financial resources; human resources; cultural resources; relational resources; and, informational resources (Morgan et al., 2006).

The RBV describes reputation as an intangible resource that is consequent from combinations of internal investments and external evaluations (Shamsie, 2003). This "social approval assets" (Pfarrer, et al. 2010) can positively impact customer behavior (Gatzert, 2015), loyalty and consumption experience (Cretu & Brodie, 2007).

Reputational resources concern intangible image-based assets available to the firm and can be a differentiation factor in the target market (Hall, 1992). These resources must be understood as a source of competitive advantage, since they are rare, difficult to imitate and transfer and permeate the company's activity (Barney, 1991).

The most important reputational asset relevant to export performance identified in the literature is brand equity. This concept is associated to a set of assets linked to the name and symbol of the brand that adds value to the initial value of the product or service, such brand name awareness, distinctiveness of brand image, appeal of brand 'personality' and strength of brand image (Morgan et al., 2006). This valuable intangible resource allows the company to build and protect its market share, enhance marketing investments and introduce new products in the export target market more easily (Aaker, 2010).

Aaker (1991) identifies brand awareness as the potential customer ability to recognize that a brand has certain category. This recognition helps a brand to distinguish from others. Brand associations consist of brand-related thoughts, feelings, perceptions, smells, colors, music, images, experiences, beliefs and attitudes (Kotler & Keller 2011). Brand loyalty is defined as the attachment that a customer has to a brand. Perceived quality can be defined as customers' judgment about a product's overall excellence or superiority. Consequently, perceived quality is a overall feeling about a brand and does not imply the actual quality of a product (Aaker, 1991).

According to the RBV, performance differences across firms can be attributed to the heterogeneity in the firms' resources and capabilities (Makadok, 2001; Teece et al., 1997; Hitt et al., 2001). Resources that are valuable, unique, and difficult to imitate can provide competitive advantages (Amit & Schoemaker, 1993; Barney, 1991). In turn, these advantages provide positive returns (Peteraf, 1993). We therefore propose that:

H1: Reputational resources influences positively and significantly export performance.

2. Methodology

2.1. Sample

To test the hypothesis a sample of Portuguese footwear companies was used that meted the following criteria: companies in which at least 50% of income comes from exports of goods, or companies in which at least 10% of income comes from exports of goods and the export value is higher than 150,000 Euros (INE, 2011).

For information regarding companies the *Associação Portuguesa dos Industriais de Calçado, Componentes, Artigos em Pele e seus Sucedâneos* (APICCAPS) was contacted. We were provided with a database of 231 companies (company name, telephone contact, email, CAE, export markets, export intensity and capital origin) but only 167 companies fulfilled the parameters. All companies were contacted by APICCAPS and later by the authors, via e-mail and telephone, to ensure a higher rate of valid responses. The questionnaires began on April 22, 2014 and ended on July 22, 2014. After finishing the data collection period, 42 valid questionnaires were received, representing a 25% response rate. In this investigation we use a Non-probability sampling since the respondents were chosen for being members of APICCAPS.

2.2. Measure instrument and data collection process

To measure the reputational resources this study used the four items scale proposed by Morgan, Vorhies, & Schlegelmilch (2006). The respondents were asked to rate on a five-point Likert scale these resources available to export venture, relative to those of their major competitors (in this export market).

Okpara's scale (2009) was used to assess export performance, with five items scale comprising profitability indicators of sales growth, profit, activities, operations and performance in general. A five point Likert scale was also used to measure each item.

Data collection was implemented through online questionnaire in *Limesurvey*, version 1.91. To reduce misunderstandings, the questionnaire was validated by the research department of APICCAPS. The analysis unit used in this research was export venture.

3. Results And Analysis

3.1. Reliability Analysis

In order to verify the reliability of overall variables we estimated the stability and internal consistency through Cronbach's alpha (α). In general, an instrument or test is classified with appropriate reliability when α is higher or equal to 0.70 (Nunnally, 1978). However, in some research scenarios in social sciences an α of 0.60 is considered acceptable, as long as the results are interpreted with caution and the context is taken into account (DeVellis, 2012). For the present study we used the scale proposed by Pestana and Gageiro (2008).

The result of 0.905 achieved for all of variables is considered excellent, confirming the sample's internal consistency. It was also conducted an internal consistency test for all variables in each construct to assess their reliability (Table 1).

Table 1: Internal consistency test by construct (Cronbach's Alpha)

Construct	***Cronbach's α***	**Items Nr.**	**N**	**Analysis**
Reputational resources	.905	4	42	Excellent
Export performance	.927	5	42	Excellent

We found that both constructs have an excellent consistency.

3.2. Exploratory factor analysis

3.2.1. Reputational resources

We performed a factor analysis, with Varimax rotation, of entrepreneurial orientation construct items that comprise the scale, with the purpose of finding a solution that was more easily interpretable. Three factors were extracted and there was no need to delete items.

Thus, we obtained a scale composed of 4 items, distributed over one factor that explain 87.71% of total variance. The saturation of this factor varies between 0.695 e 0.819. Analyzing the internal consistency of these factor, we found that Cronbach's Alpha have an excellent internal consistency (α=0.931). KMO test indicates that there is a reasonable correlation between the variables (0.796). Bartlett's sphericity test registered a value of $\chi^2(210, N=42)=630.742$, $p<0.05$, therefore is confirmed that $\chi^2>\chi_{0.95}^2$, so the null hypothesis is rejected, i.e. the variables are correlated.

3.2.2. Export performance

In the factor analysis, with Varimax rotation, of export performance construct we got a scale with one factor and there was no need to delete items. A scale with 5 items was obtained, which explained 77.9% of total variance.

The internal consistency is excellent (α=0.927). KMO test point to a good correlation between the variables (0.814). Bartlett's sphericity test registered a value of $\chi^2(10, N=42) = 171.982$, $p<0.05$, therefore is confirmed that $\chi^2 > \chi_{0.95}^2$, so the null hypothesis is rejected and the variables are correlated.

3.3. Multiple linear regression

In linear regression the coefficient of determination R^2 measures the proportion of total variability that can be explained by regression ($0 \leq R \leq 1$), measuring the effect of independent variables on dependent variable (Marôco, 2011).

We carried out a multiple linear regression analysis linking variables of the studied constructs. The coefficient of determination R^2 measures the proportion of total variability that can be explained by regression, while the ANOVA regression provide information about levels of variability within a regression model, form a basis for tests of significance and allows to test the hypotheses: H0: $\rho^2=0$ *vs.* H1: $\rho^2 \neq 0$ (table 6).

Table 6: Summary and ANOVA regression

Model	R	R^2	Adj. R^2	Standard error	F	Sig.
1	.325[a]	.106	.083	.95738806	4.731	.036*

a. Predictors: (Constant) Reputational resources. Dependent variable: Export performance.
* $p<0.05$.
The previous table presents for model 1 a value of F=4.731, with ρ-*value*=0.036 (Sig.), so H0 is rejected in favour of H1. Thus, H1 is supported.

Conclusion

The goal of this study was to contribute to the large body of organizational and strategy research on intangible assets by specifying if reputational resources influence export performance of Portuguese SME.

This study provided evidence that reputational resources, mainly related to brand, have a positive and significant impact on export performance. This intangible resource enables the exporting company to increase its' notoriety, image distinctiveness, attractiveness of "personality" and image strength. These strong differentiation factors facilitate the development of existing products and/or introduce new products in foreign markets, thus following the market trends.

Brand equity contributes to add value to the product (and associated services) by promoting brand loyalty and increasing perceived quality by the customer.

Theoretical and practical implications

This study contributes to the theory of strategic management and consolidates the RBV, especially relating to reputational resources as one of the strategic determinants of export performance. It is known that strategy encompasses deliberate and emergent initiatives adopted by management, including the use of resources and capabilities to improve companies' performance (Nag, Hambrick, & Chen, 2007).

The findings are a contribution to clarify the influence of reputational resources on companies' export performance. To remain competitive, firms must do an internal assessment to find out which reputational resources provide them advantage over competitors and achieve superior export performance.

This study deeply analyzed a very important industry to the Portuguese balance of trade, as is the case of the footwear production, by understanding the contributions of reputational resources to the export performance.

This study also provided practical implications. On one hand, it is necessary to (re)define public policies to support and stimulate this industry activity and growth. On the other hand, this research draws attention to social approval assets, which managers may overlook. It is essential that managers are able to enhance their brand reputation by promoting brand name awareness, distinctiveness of brand image, appeal of brand 'personality' and overall strength of brand image, to be proactive and capable to identify present and future needs and trends of the target market, anticipate changes in demand and seek new business opportunities.

Research limitations

The main limitation of this study is the sample size, since it was difficult to find companies willing to collaborate in this type of research. The fact that this study used a non-probability convenience sampling is also a limitation. Therefore, we suggest caution in generalizing the results. Future studies should consider using random sampling approaches to enhance the validity of the findings.

The responses to the questionnaire were based on the subjective judgment of respondents. Although literature identifies the advantages of subjective measures to evaluate exports performance, it is recognized that some answers may not represent the reality of business performance in foreign markets.

Finally, this study considers export as an exclusive form of internationalization and such can be appointed as limitation.

Future lines of research

In future research, it is recommended that the studied model is used in a larger sample, in order to confirm the findings. It is also suggested to proceed with the research of strategic management in Portugal, focusing also on other sectors of the national economy, so that, in future, one can compare the present study with identical ones and thus find new factors that contribute to higher export performance.

Abstract

The purpose of this paper is to study some selected factors that we believe that affect students' motivation. For this reason totally 120 students participated in the study. Study is conducted in March 2015. Factors as (1) the quality of teaching, (2) teacher's attitude, (3) students' participation in class, (4) students' competitiveness, (5) the fear of course failure, (6) high grades, (7) possibilities for getting a good job after graduation, (8) making parents happy, (9) the interest in learning the courses, and (10) the relevance of the course for the future career are analyzed.
Factors are grouped in three subgroups as teacher-academic motivation, student's motivation, and university motivation. Teachers' quality is confirmed as the most impact factor for their motivation. Teachers are who make students to be motivated, respectively unmotivated. Students believed that there is no unique formula for teaching and asses them. Hence, different methods in this line used by teachers make students more interested to addend and learn for. Moreover, practically oriented courses are welcomed for students.

Keywords: factors, motivation, students, Cronbach's alpha.

Introduction and Literature review

What are factors that make students be motivated? This is the question raised by many theoretical and practical stakeholders. Student's motivation is a topic for which many academic, researchers, educational institutions and others are interested. The answer to this question is not easy and many studies are done in this line. This study also tries to answer this question.

This is an interdisciplinary study in which the main aim is to identify which factors (values, qualities) affect students' motivation for learning at the five different faculties operating within the South East European University (hereafter SEEU).

Factors that influence students' motivation for learning will be considered through an analysis of their perceptions about (1) the quality of teaching, (2) teacher's attitude, (3) students' participation in class, (4) students' competitiveness, (5) the fear of course failure, (6) high grades, (7) possibilities for getting a good job after graduation, (8) making parents happy, (9) the interest in learning the courses, and (10) the relevance of the course for the future career. Hence, these factors are divided in three groups:

- The academic role of a teacher in students' motivation,
- The own students' role or students' responsibility in their motivation, and
- The administrative role of the University in students' motivation.

On the other hand, the study aims at identifying which the strongest de motivating factors are according to students' perceptions. It is also expected to provide information about various and specific aspects of teaching that impact students' motivation in order to achieve better learning outcomes.

Finally, it is expected that certain important factors which affect students' motivation at SEEU will be identified and analyzed. Through these research results we expect to contribute to achieving better learning outcomes and higher academic performance, as well as more satisfying experiences for our students in general. The study could general improve standards. The outcome would be for teachers, managers and relevant administrative staff. Hence, they could take concrete measures to minimize any difficulties or de-motivating factors.

There are extensive studies on the topic of student motivation and what are the key factors. The debate is ongoing, and some selected studies are presented below.

Tuan, Chin and Shieh (2005) have examined six factors of motivation as self-efficacy, active learning strategies, science learning value, performance goal, achievement goal, and learning environment stimulation.

Zepke, Leach and Butler (2010) have examined how the trinomial: teachers, external factors and student motivation influence engagement.

Green and Kelso (2006) have examined the influence of personal, teacher behavior, and institutional-structural factors. Besides other findings, they came to conclusion that "teacher behaviors are among those rated by students as having the most influence on their motivation to succeed." (p. 65)

Harb and El-Shaarawi (2006) in their study, besides other findings, came to conclusion that student's competence in English and class participation are the most important factors that positively affects student's performance.

Hanrahan (1998) have examined the learning environment. Her study "concluded that more activities should be used which either implicitly or explicitly reinforce positive beliefs about the need for self-direction in learning."

Zhao (2012) has examined also the factors that influence motivation. Study besides other finding, concluded that "both internal and external factors are considered having great effect on students' learning motivation, but they are not put into full play to promote and sustain students' motivation." (p. 109)

Sanfeliz and Stalzer (2003, p. 65) think that "when students actively participate in science, they can also become active participants in the educational process."

Skinner and Belmont (1993, p. 571) found that "students who are behaviorally disengaged receive teacher responses that should further undermine their motivation. The importance of the student-teacher relationship, especially interpersonal involvement, in optimizing student motivation is highlighted."

Research design and methodology

In this study the deductive approach is used. Moreover, case study as a research method is used because the study provides evidence which cannot be generalized, i.e. results and discussions are in context of the SEEU and time that the study is realized.

Data are obtained using online questionnaires (for more see appendixes). Totally 120 students from SEEU participated in the study in the period March 2015. The composition of 120 students that were responded to this questioner is as following. Firstly, according to gender 52% are male and 48% female. Secondly, according to study year 40.8% are the first year students, 36.7% second year and 22.5% third year. Thirdly, according to the faculty majority of observations are from Faculty of Business and Economics with 43.3%. Fourthly, based on student's success majority of selected students have GPA higher than 9. The structure of selected sample is presented in table 2.

Questionnaire was created with questions related with student data and other information that are related to specified factors that affect students 'motivation to study. Questionnaire' idea and concepts were based on Junaidu (2004) and modified by the case conditions. Questionnaire aim was to study which of motivation factors effect students' interest to study more. Because structure of study was with qualitative data, initially after data gathering they are coded for further statistical analysis.

Data are processed and analyses are performed using Statistical Analysis Software (SPSS). Descriptive analyis are done for gender, study year, faculty in which students study and their declared success. After that Crosstabulation (crros-tables) is used to study motivation factors toward gender, study year, faculty in which students study and their declared success.

Also, in this study is measured realibility of motivation scales for student's study using Cronbach's alpha coefficient. Students were asked to respond to the statement using a four-point Likert scale ranging from 1 (Strongly Agree) to 4 (Strongly Disagree).

A commonly accepted rule for describing internal consistency using Cronbach's alpha is as following (see table 1).

Table 1: Description of Cronbach's alpha

Cronbach's alpha	Description
> 0.90	Excellent
0.80 - 0.89	Good
0.70 - 0.79	Acceptable
0.60 - 0.69	Questionable
0.50 - 0.59	Poor
< 0.50	Unacceptable

Results and discussion

In this section are discussed obtained results. Students believed that teaching quality (questions Q1-Q4) have motivated them. Students are declared above 90% with strongly agree and agree that teaching quality have motivated them. Students are declared above 80% with strongly agree and agree (questions Q5-Q8) that theirs responsibility have influenced motivation, except question 7 "another strong reason that makes me work harder for my courses is that I always want to be better than my colleagues in class" with 59.16% strongly agree and agree. Finally, students are declared above 65% with strongly agree and agree that university academic role have motivated them (questions Q9-Q12). More detailed results are given in table 3.

Table 3: Factors that affect students' motivation

No	Question	Answer	Total
Q1	Teaching quality (Professor being knowledgeable and well prepared for class) is a strong reason to like a course and to make more efforts with it.	Strongly agree	61.67%
		Agree	33.33%
		Disagree	5.00%
		Strongly disagree	0.00%
Q2	I easily lose interest in a course if I notice that the professor does not care about the students (how they feel, what they like and dislike, etc.)	Strongly agree	45.00%
		Agree	43.33%
		Disagree	11.67%
		Strongly disagree	0.00%
Q3	I'm more interested in a course if the professor has a friendly attitude towards students.	Strongly agree	61.67%
		Agree	36.67%
		Disagree	1.67%
		Strongly disagree	0.00%
Q4	Courses in which professors use different methods for teaching and assessment are much more interesting to attend and learn for.	Strongly agree	65.00%
		Agree	30.83%
		Disagree	3.33%
		Strongly disagree	0.83%
Q5	A big reason that makes me do additional effort with a course is to get a higher grade.	Strongly agree	36.67%
		Agree	45.00%
		Disagree	16.67%
		Strongly disagree	1.67%
Q6	The wish to make my parents happy is another factor that makes me put more efforts with a course.	Strongly agree	45.00%
		Agree	38.33%
		Disagree	10.83%
		Strongly disagree	5.83%
Q7	Another strong reason that makes me work harder for my courses is that I always want to be better than my colleagues in class.	Strongly agree	20.83%
		Agree	38.33%
		Disagree	32.50%
		Strongly disagree	8.33%
Q8	I work hard to get good grades because that will ensure a better job in the future.	Strongly agree	41.67%
		Agree	40.00%
		Disagree	10.00%
		Strongly disagree	8.33%
Q9	I am only interested in the courses that I know I can I need during my working career.	Strongly agree	25.83%
		Agree	41.67%
		Disagree	23.33%
		Strongly disagree	9.17%
Q10	Practically oriented courses (that contain more practice than theory) are always more interesting.	Strongly agree	68.33%
		Agree	24.17%
		Disagree	6.67%

Source: authors' calculations.

In order to have more detailed view for these factors that affect students' motivation based on gender, year study, faculty and GPA, a cross tabulation is performed. Some of selected results are as below.
In question Q1 regarding whether teaching quality has motivated students, majority of them strongly agree. No one say that strongly disagree related with this factor. This factor was the most important factor in student's learning (with 27%). Majority of students answered in this question are in second year, are in FBE and have GPAs higher than 9.

In question Q2 regarding whether a professor cares about students, majority of students were answered that strongly agree or agree. Differences are found comparing faculties. For example, while 62% of students strongly agree in FCST, in FPA&PS 29% of students strongly agree. But, in general context majority of students strongly agree or agree related this question.

In question Q3 regarding whether a professor has a friendly attitude towards students, majority of students were answered that strongly agree or agree. Students that strongly agree are more in third year and in FPA&PS, whereas agree in first year and in FBE. Majority of students that strongly agree have GPAs higher than 9 whereas they that agree between 7 and 8.

In question Q4 regarding whether a professor use different methods for teaching and assessment, majority of students strongly agree, and in first year in FL. Majority of students that strongly agree have GPAs between 6 and 7, whereas they that agree between 7 and 8.

In question Q5 regarding students to get higher grades, majority of students agree, are in third year and have GPAs between 6 and 7.

In question Q6 regarding students making parents happy, majority of students strongly agree, are in first year and in FBE.

In question Q7 regarding students to be better than theirs colleagues in class, majority of students agree, are in first year and in FBE.

In question Q8 regarding in the future students to ensure a better job, majority of students believe that they work hard to get good grades because they will ensure a batter job in the future.

In question Q9 regarding working career, majority of students were answered with agree and are first year students.

In question Q10 regarding practically oriented courses, majority of students were answered with strongly agree and are second year students.

In question Q11 regarding administrative services, majority of students were answered with agree and are first year students.

Finally, in question Q12 regarding working conditions, majority of students were answered with agree and are second year students. For more detailed results see appendixes.

To measure the importance of these factors, students are answered in question that which of selected factors (Q1-Q12) have most influence in theirs learning. Table 4 shows the impact that has each selected variables (factors) in students' learning. From the maximum 100 percent, results per each factor are as below.

Order of questions-factors is done from the highest to lower impact in students' learning. As results show students believed that factor Q1: "teaching quality (professor being knowledgeable and well prepared for class) is a strong reason to like a course and to make more efforts with it" has the strongest impact in learning for them. Is followed by Q4: "courses in which professors use different methods for teaching and assessment are much more interesting to attend and learn for", and so on.

Factor Q7: "another strong reason that makes me work harder for my courses is that I always want to be better than my colleagues in class" has no impact. However, factors as working career (Q9), higher grade (Q5), working conditions (Q12), students care (Q2) and administrative service (Q11) have lower impacts in student's learning.

Table 4: Impact of factors in students' learning

Q1-teaching quality	Q4-different methods	Q10-practically oriented	Q3-friendly attitude	Q6-parents	Q8-better job	Q9-working career	Q5-higher grade	Q12-working conditions	Q2-lose interest	Q11-administrative services	Q7-better than colleagues	Total
26.7	15.0	14.2	10.0	10.0	10.0	4.2	3.3	2.5	2.5	1.7	0.0	100.0

Source: authors' calculations.

In the appendixes are presented results of factors that affect learning according to student's gender, study year, faculties, respectively GPAs.

A reliability analysis Cronbach's alpha was further conducted to determine if all item groupings are acceptable and reliable (see table 5). Generally, a questionnaire with an α of 0.8 is considered reliable (Field, 2009).

The first factor (Teacher-Academic Motivation) has 4 items with a reliability Cronbach's alpha is about 0.74, the second factor (Students Motivation) has 4 items with a Cronbach' alpha value is about 0.72, and the third factor (University Motivation) has 4 items with Cronbach' alpha value is about 0.73. The Cronbach's alpha indicator of the three factors suggests that the items have relatively high internal consistency.

Table 5: Rotated factor matrix

Items Questions	Factors		
	F1-for Teacher	**F2-for Students**	**F3- for University**
Teaching quality (professor being knowledgeable and well prepared for class) is a strong reason to like a course and to make more efforts with it.	0.745		
I easily lose interest in a course if I notice that the professor does not care about the students (how they feel, what they like and dislike, etc.)	0.761		
I'm more interested in a course if the professor has a friendly attitude towards students.	0.75		
Courses in which professors use different methods for teaching and assessment are much more interesting to attend and learn for.	0.735		
A big reason that makes me do additional effort with a course is to get a higher grade.		0.725	
The wish to make my parents happy is another factor that makes me put more efforts with a course.		0.721	
Another strong reason that makes me work harder for my courses is that I always want to be better than my colleagues in class.		0.744	
I work hard to get good grades because that will ensure a better job in the future.		0.72	
I am only interested in the courses that I know I can I need during my working career.			0.73
Practically oriented courses (that contain more practice than theory) are always more interesting.			0.744
The administrative services at my Faculty make my interest for learning higher.			0.725
The working conditions at my Faculty (classrooms, technical equipment, etc.) make my interest in learning higher.			0.73

Source: authors' calculations.

Results denoted that students' perceptions confirmed that in majority cases for selected factors they agree or strongly agree. Factor Q1-teaching quality was confirmed the first most important factor. After that, is followed with factors Q4-different methods for teaching and assessment as second important factor. Moreover, students believed that courses that are practically oriented are more interesting (factor Q10). On the other hand, students believed that factors as administrative services (Q11), professor care about students (Q2), working conditions (Q12), higher grades (Q5) and working career (Q9) have minor impact in their motivation regards learning. Students believed that working harder in order to be better than other class colleagues has no impact in their motivation. So, they are not oriented according to competition and who will be better in a class.

The Cronbach's alpha indicator of the three factors (teacher-academic motivation, students' motivation and university motivation) suggests that the items have relatively high internal consistency.

Conclusions

The purpose of this study was to study some factors that are supposed to affect students' motivation related with the learning and teaching process. Teaching quality was confirmed as the most impact factor in students' motivation. Teachers are who make students to be motivated, respectively unmotivated.

It can be concluded that the University has to strength teaching quality because it is the most valuable intangible asset. Well prepared teachers present the University goodwill. Hence, the key point in improving the University performance is to continue increasing and strength teaching quality and capabilities.

This study has own limitations. This kind of study is performed for the first time in SEEU. For this reason is suggested to be repeated with same methodology in order to confirm and strong founded evidence. Comparing results between SEEU and others universities in region or international context are welcomed.

Accessible Tourism Services on an Example of Accommodation Facilities in Prague

Ivica Linderová, College of Polytechnics Jihlava, Department of Travel and Tourism, Tolstého 16, 586 01 Jihlava, Czech Republic, ivica.linderova@vspj.cz

Petr Scholz, College of Polytechnics Jihlava, Department of Travel and Tourism, Tolstého 16, 586 01 Jihlava, Czech Republic, petr.scholz@vspj.cz

Abstract

Accessibility in tourism is one of the most discussed topics in the European Union. The number of disabled visitors increases also due to ageing population. In this context, the paper deals with accessible tourism and also it informs about requirements of disabled visitors on accommodation facilities. The paper focuses on accessible accommodation facilities in Prague and it shows possibilities for disabled visitors to travel there and enjoy their leisure time activities.

The aim of the article is to detect the readiness of the accommodation facilities to the providing services for disabled visitors in Prague. It compares a share of barrier-free accommodation facilities in Prague and other regions in the Czech Republic. We used primary and secondary research and from the methods of scientific work the analysis was used.

Keywords: Accessibility, accommodation facility, disability, universal design.

Introduction

Tourism is an important part of regional economy with numerous economic and also socio-cultural impacts. The share of Tourism on GDP in the world is 9 % (UNWTO Highlights 2015), in the Czech Republic 2.9 % (Czech Statistical Office).

In context of ageing the world population is still more important orientation on social tourism. The European Union uses for social tourism a term "tourism for all". This term often refers to very different aspects. Sometimes, in particular in social policy context, it is used to underline the need to facilitate holidays for lower income groups, sometimes to take into account the needs of disabled visitors (Leidner, 2006).

Each person should have possibility to travel and discover beauties of Earth. According the Global Code of Ethics for Tourism (UNWTO, 2001) all tourism activities should respect the equality of men and women. They should promote human rights and, more particularly, the individual rights of the most vulnerable groups, notably children, the elderly, the handicapped, ethnic minorities and indigenous peoples (art. 2). The prospect of direct and personal access to the discovery and enjoyment of the planet's resources constitutes a right equally open to all the world's inhabitants. The increasingly extensive participation in national and international tourism should be regarded as one of the best possible expressions of the sustained growth of free time, and obstacles should not be placed in its way (art. 7). Really important is, that social tourism, and in particular associative tourism, which facilitates widespread access to leisure, travel and holidays, should be developed with the support of the public authorities (art. 7, Linderová, 2015b). Global Code of Ethics for Tourism is a framework of reference and a set of principles to guide all the stakeholders in the sector towards responsible and sustainable development of global tourism. One of the Code's aims was to summarize various documents, codes and declarations (Manila Declaration, Tourism Bill of Rights, Tourist Code) of the same nature or with a similar purpose, which had been adopted by UNWTO throughout the years. On several occasions, the Code expressly mentions the right of all persons to practise tourism. Furthermore, articles 2 and 7 make explicit reference to the rights of persons with

disabilities and the need for all stakeholders to facilitate these persons' travel and tourist movements (UNWTO, 2015).

For accommodation facilities are disabled visitors an interesting target group. Disabled people are loyal customers, often returning to places that provide good accessibility. Other people may also benefit from improved accessibility, for example parents with pushchairs, people with injuries, and tourists with heavy luggage (Office for Official Publications of the European Communities, 2004).

Accessibility in accommodation facilities

Social tourism is one of the most discussed topics in the European Union nowadays. Minnaert (2014) says that social tourism is tourism that specifically encourages the participation in tourism activities of people who are economically weak or otherwise disadvantaged. Cazes (2000) sees social tourism as a complex phenomenon, which allows tourism participation for disadvantaged persons. It respects human rights as right for holiday and right for tourism, it is based on non-profit concept and it accepts social and financial situation of participants. According to Cazes, the aim of the social tourism is active use of leisure time, physical and cultural development of participants.

Various researchers have sought to highlight (McCabe, Johnson, 2013):
a) the transformative social possibilities of tourism (Higgins-Desbiolles, 2006),
b) concerns about equality of access and participation (Minnaert, Quinn, Griffen, and Stacey, 2010),
c) the individual and social benefits that can be derived from participation by disadvantaged groups (Minnaert, Maitland, and Miller, 2009).

Accessible tourism for all is a form of tourism that involves a collaborative process among stakeholders that enables people with access requirements, including mobility, vision, hearing and cognitive dimensions of access, to function independently and with equity and dignity through the delivery of universally designed tourism products, services and environments (Linderová, 2015a).

In practice, social tourism addresses four main target groups – senior citizens, young people, families with low-income and people with disabilities. Majority of these target groups have special requirements during their travel and holiday. Disabled visitors and seniors are groups with the biggest needs. They have limited mobility and they need special environment.

In the context of traveling of disabled visitors we speak about "accessible tourism for all". It is better to avoid misunderstandings.

People with disabilities are also those who are limited in the work they can do because of a longstanding health problem or a basic activity difficulty (Eurostat, 2014).

Persons with disabilities are diverse and heterogeneous, while stereotypical views of disability emphasize wheelchair users and a few other "classic" groups such as blind people and deaf people. Disability encompasses the child born with a congenital condition such as cerebral palsy or the young soldier who loses his leg to a land-mine, or the middle-aged woman with severe arthritis, or the older person with dementia, among many others. Health conditions can be visible or invisible; temporary or long term; static, episodic, or degenerating; painful or inconsequential (Linderová, 2015b).

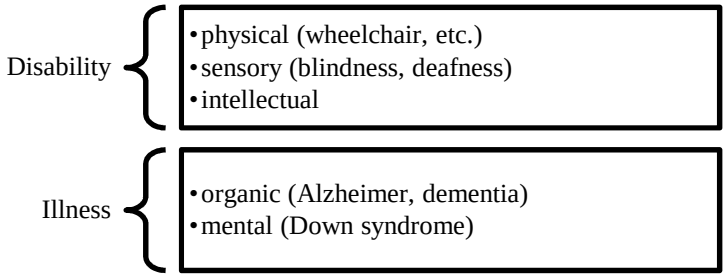

Figure 1: Disability vs. illness

Source: UNWTO, ENAT, ONCE. (2014). Manual sobre Turismo Accesible para Todos: Principios, herramientas y buenas prácticas.

According to the World Health Organization (2011) there are approximately 1 billion persons with disabilities in the world. This equates to approximately 15 % of the world population having a physical, mental or sensory disability. In addition, a rapid ageing of the population is under way. In 2009 there were more than 730 million people over age 60, equivalent to 10 % of the global population, which represented an increase of more than 20 % since 2000. By the year 2050 the number of persons over age 60 is projected to increase up to 20 % of the world population, with one-fifth of this group being over 80 years old. Due to the ageing population in the industrialized countries, the rate of disability among people with the capacity to travel is also increasing, adding to the demand for an accessible environment, transport and services – thereby adding to the market value of the accessible tourism segment (Rahman, 2005).

Accessibility is a central element of any responsible and sustainable tourism policy. It is both a human rights imperative, and an exceptional business opportunity. Above all, we must come to appreciate that accessible tourism does not only benefit persons with disabilities or special needs; it benefits us all (UNWTO, 2013). Accessibility refers to how easy it is for everybody to approach, enter and use buildings, outdoor areas and other facilities, independently, without the need for special arrangements. Providing information on accessibility and improving access benefits a wide range of people who want to travel, but who may find it difficult (Office for Official Publications of the European Communities, 2004).

The tourist service chain, however, begins with information about offers, events, destinations and the possibilities to get there. Accessible information, for example, means that the websites of tourism enterprises (including the transport sector) and destinations must be accessible also for blind and visually impaired users. To achieve better accessibility of the tourism sector would also prerequisite accessible public and private transport facilities and accessible buildings and attractions in destinations (Leidner, 2006; In Linderová, 2015a).

Persons with disabilities have special needs. So it is important to adapt for them (Linderová, 2015a) parking areas, communication tools, horizontal and vertical movements, accommodation and catering facilities, cultural activities, sport facilities, green spaces and natural environment.

It is important to adapt accommodation facilities for disabled visitors when we speak about accommodation facilities market. There should be good access to the building e.g. ramps and also special parking spaces with proper identification for vehicles of persons with reduced mobility close to the hotel. All car parks should have a minimum of one space designated for disabled drivers. Best practice is 6 % of barrier-free parking spaces, it means parking space at least 3.3 metres wide (Linderová, 2015a).

It is important to think about horizontal and vertical movements inside of the accommodation facilities. Horizontal movements mean elevators, vertical movements e.g. stairs. Stairs and other

barriers e.g. threshold should be signed. For disabled visitors are important also communication tools, e.g. the use of sign language, Braille, and augmentative and alternative way, adapted telephone, fax, internet.

Accessible accommodation should be as close as possible and on the ground floor where possible. A reasonable number of rooms in an accommodation establishment should be fully accessible to a person in a wheelchair without assistance (UNWTO, 2005). Such rooms should be designed in such a way as to allow all users to carry out the actions of moving, grasping, locating, and communicating easily and independently. This shall apply also to bathrooms and terraces if the room is so equipped (UNWTO, 2005).

A minimum transfer space for toilets, beds and seating is 750 mm. Best practice is 950 mm or wider. Height of controls for door handles, switches, lifts should be within the minimum range of 900 mm to 1,400 mm from the floor. Best practice is 850 mm to < 1,200 mm. A minimum area of circulation space for all rooms, WCs, bathrooms is 1,200 mm x 1,200 mm (or diameter 1,200 mm). Best practice is 1,800 mm x 1,800 mm (or diameter 1,800 mm). If a person with visual impairments is occupying a room alone, staff should offer to orientate the guest on the position of furniture and facilities in the accommodation (Linderová, 2015a).

To this end, the space and technical aids needed to allow any manoeuvre to be carried out easily and safely shall be taken into account. The needs of persons with impaired dexterity, blind persons, and deaf persons shall be taken into account in the design of all devices and actuators (UNWTO, 2005). Such rooms in an establishment should be fitted with alarm systems suitable for deaf visitors and a system of communication between the reception desk and the room that is suitable for such persons (UNWTO, 2005). A suitable telephone, alarm or other means of calling for help must be available. Corridors and passageways should be of a width to allow the passage of two wheelchairs so they are not blocked in normal traffic; otherwise, crossing zones should be provided (UNWTO, 2005).

Also hotel catering possibilities as restaurant, café, lobby bar should by adapted for disabled visitors as well as other services e.g. swimming pool, wellness centre, sauna or garden. Restaurants, cafés and bars in the hotel should provide accessible facilities which take into account ease of exterior access, furniture designed to enable their utilization by users in wheelchairs, bars at different heights, menus in Braille and with easily readable type, accessible bathrooms, etc. Such establishments should be clearly marked to make them easy to find (UNWTO, 2005).

For many people with disabilities affecting mobility, accommodation availability is critical to staying at a destination. Quite simply, if they cannot find barrier-free accommodation then they will not travel to the destination. One travel planning information issue is obtaining information about barrier-free accommodation. Many accommodation operators do not understand what accessible or barrier-free accommodation entails. In many cases, this involves accommodation operators representing their rooms as accessible or barrier-free, but people with disabilities find that the rooms are not suitable (Economic and Social Commission for Asia and the Pacific, 2003).

Barriers to accommodation occur in relation to the surrounding environment of the accommodation (location, proximity to services, public transport, parking and drop-offs), the reception, other facilities and services, and the rooms. The accommodation needs of disabled visitors on the individual, their disability and the level of their support needs (Economic and Social Commission for Asia and the Pacific, 2003).

Table 1: Barriers in accommodation facilities

Access and check-in	- lack of continuous pathways (from parking or drop off throughout all hotel facilities and to the room - reception counters are too high - door widths - circulation space in corridor
Room	- rooms are inappropriately located - no steps into rooms - door widths, door stops weight, D type door handles - circulation space in rooms - uncluttered furniture layout - cupboard height and reach - access to balconies - location of cupboards, fridge, TV, clock radio, telephone, ironing equipment, etc. - availability of telephone typewriters and visual signals for deaf people - provision of orientation for people with vision impairments, including blindness - table heights - bed heights, clearance under beds - switch and handle locations
Bathroom	- hobless roll in showers - hand held shower hose - lever taps - mirror location - hand basin positioning - space under the hand basin - need for adequate shower chair or bench - location of handrails - toilet height - positioning of the toilet (distance from the walls and front clearance)

Research design and methodology

The scientific goal of this paper is to detect the readiness of the accommodation facilities to the providing services for disabled visitors in Prague. We were interested in adapted accommodation facilities.

When searching for the possibilities for disabled visitors, we used primary and secondary (desk) research. Secondary research makes use of information previously researched for other purposes and publicly available. We focused on the documents dealing with barrier-free environment. We were interested in databases of accommodation facilities. Some information we gained from the information centres.

Primary research is a new research, carried out to answer specific issues or questions. It can involve questionnaires, surveys or interviews with individuals or small groups. Primary data were collected during the visit of accommodation facilities, which were not defined as strictly barrier-free. We used questionnaires and we contacted managers in accommodation facilities in three ways: face to face, over the phone or by e-mail. We also contacted municipality and regional office.

Results and discussion

Prague is the capital city of the Czech Republic and also the biggest city with 1,246,780 inhabitants. When speaking about economy level, Prague is the richest region with high life standard and the lowest unemployment.
Prague with its historical centre and monuments is 6th most visiting European city. In year 2000 Prague was the European Capital of Culture.

In the last years, Prague also pays attention to the barrier-free environment. Disabled visitors can there visit the Prague castle and the historical town with churches registered in UNESCO List of Cultural Heritage. It is possible to find there accessible accommodation facilities, adapted restaurants and cafés, suitable museums, galleries, sport facilities and also barrier-free transport.

In this article we were interested in accessible accommodation facilities. We have to say that number of accessible accommodation facilities in Prague increases but there are still not enough possibilities to stay for disabled visitors.

For the purpose of our research accessible accommodation facility means barrier-free access to the building and adapted room include suitable bathroom. Disabled visitors could use also accommodation facilities where is necessary staff or caregiver assistance e.g. access with one or two stairs, a close door etc.

In Prague there are located 621 accommodation facilities with 80.925 beds (2012 data). According to our analysis 114 from them are accessible, some of them with a little help of an assistant. The most full accessible accommodation facilities belong to the hotels in the First Class (46) and hotels in the Standard Class (31).

Table 2: Accessible accommodation facilities (AF) in Prague

Number of AF	Accessible AF	Hotel ***	Hotel ****	Hotel *****	Pension	Other	Share of AF
621	114	37	55	12	6	4	18,4 %

Source: Own research.

Majority of accommodation facilities has only one or two adapted rooms. To the accommodation facilities with more barrier-free rooms belong e.g. Ibis Praha Wenceslas Square***, Mövenpick Hotel Prague****, Top Hotel Praha & Congress Centre, Courtyard Marriott Prague Airport****, Hilton Prague*****, ILF***, Hotel U tří korunek***, Orea Hotel Pyramida****, Dorint Hotel Don Giovanni****.

A lack of information about accessible services is one of the biggest problems in the accommodation facilities in Prague. It is difficult to find information about adapted rooms, parking places etc. Some of accommodation facilities present accessible accommodation through web-portals, but a lot of hotels, hostels, guest houses do not inform about their accessibility. In many cases there is missing information about parking places, hotel restaurant, wellness etc. Majority of adapted accommodation facilities informs about adapted access or room, but more information are inaccessible.

Problem is also a lack of knowledge and ignorance. In many cases website informs about accessibility, but e.g. there is barrier-free access, but not barrier-free public toilet in the hotel hall, not adapted room or rooms are not usable for blind visitors etc. Also unqualified and unskilled staff is a problem. Hotel staff should to know how to behave to disabled visitor. In this area we see a big gap, which has to be reformed. We state that unqualified staff is problem not just in Prague but in other regions and towns of the Czech Republic.

Some of the hotels are also interested in blind and deaf visitors. In 23 hotels there are information boards and panels in Braille font and 26 hotels dispose of special equipment for deaf visitors e.g. light signalization for elevators or phones.

In Prague is also situated a local agency Accessible Prague for disabled visitors. They could find on its website information about barrier-free accommodation and catering facilities and also about monuments, museums, theatres and transport. The website offers a wide range of accommodation facilities, from Tourist class to Luxury Class. It states that a lot of accommodation facilities are situated in Prague historical centre near the Vltava River, which is easily accessible due to flat terrain. It is possible also to find some accommodation facilities in quiet residential locations.

Study limitations

It is significant to mention also about limitations of our research. We were interested in barrier-free accommodation facilities in Prague. The most important for us was accessibility for wheelchair users because they have the most exacting demands and requirements to the space. It is possible to clearly evaluate if accommodation facility is accessible for them or not. The accessibility for deaf visitors does not have clear parameters such as persons with physical disabilities.

In our research we used data from information offices, regional municipality and specialized websites. The problem is that not all barrier-free accommodation facilities present themselves on web-portals or through the information centres. The market also is developing, so we have to say that our results are not exhaustive and exact.

Conclusion

Disabled visitors are increasing market segment also due to ageing population. For accommodation facilities it is interesting the orientation for them, because these people are loyal customers and they often travel with personal assistant during the low season.

They consider as an important barrier-free access to the accommodation facilities, accessible room, suitable parking space, catering facilities etc. We state that in Prague there exist several possibilities to travel for disadvantaged persons.

Based on our research between years 2013 and 2015 we can state that Prague belongs to the region with highest share of barrier-free accommodation facilities. We assumed highest share in Prague but there are other region with higher share of accessible accommodation facilities e.g. Carlsbad.

Table 3: Share of barrier-free accommodation facilities in regions of the Czech Republic

Prague	Central Bohemia	South Bohemia	Hradec Králové	Pardubice	Moravian-Silesian	Pilsen
18.40	10.30	9.91	1.36	2.28	7.57	8.55
Carlsbad	Ústí nad Labem	Liberec	South Moravia	Vysočina	Olomouc	Zlín

We can say that the most significant failures in Prague are an unqualified staff, accommodation facilities with barrier-free access without suitable public toilets in the hotel hall, accessible rooms with bad spatial solutions, ignorance of requirements of blind and deaf visitors.

We highlight the importance of universal design and adequate approach of the staff. Universal design means the design of products, environments, programmes and services to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design (UNWTO, 2013).

Improving Environmental Sustainability in Freight Transport in Romania

Georgiana Marin, Bucharest University of Economic Studies, Bucharest, Romania, maringeorgiana57@yahoo.com
Zoltan Kato, Bucharest University of Economic Studies, Bucharest, Romania, kato_zoltan@yahoo.co.uk

Abstract

Climate change represents a major issue for mankind as it directly affects its activity. One of the major activities that affect the amount of CO2 emissions is represented by transportation. Thus the purpose of this paper is to explore how CO2 emissions from transportation can be reduced. Therefore, the authors used the Engel Granger methodology in order to explore the long term relationship between the CO2 emissions and freight transportation; if data were not suitable for this kind of study, the authors have chosen to explore correlations. Next, environmental best practices within the transportation area in Romania have been analyzed, in order to have a clear diagnosis on the know-how gathered so far in reducing CO2 emissions from transportation. Finally authors' recommendations were stated.

Keywords: intermodal transport, freight transport, CO2 emissions

Introduction

Mobility is vital for both economy and quality of citizens' life. Road transport is recognized as being more flexible, cost-efficient, transparent and provides a good quality service (Dărăbanț, Ștefănescu & Crișan, 2012), European transport being at crossroad. Old challenges remain actual, but new ones also appear. It can be said that human activities such as intensive agriculture, industrial production and transportation could be nowadays (partly) responsible for climate change. The EU launched, with the agreement of the international community, a worldwide call concerning the drastic reduction in greenhouse gas emissions (GHG), in order to limit climate changes to less than 2 ° C. The achievement of this objective by the EU includes the reduction of emissions by 80-95% in 2050 compared to 1990 (European Commission, 2011).

The European Commission's analysis presented in "A Roadmap for moving to a competitive low carbon economy in 2050" shows that while in other sectors of the economy, further important reductions of emissions can be made, in the transportation sector a reduction in GHG emissions by at least 60% compared to 1990 is required until 2050. This will correspond to a reduction of 70% compared to the levels recorded in 2008 (European Commission, 2011).

This would mean that by 2030, the GHG emissions in the transport sector should be reduced by approximately 20% compared to the level recorded in 2008 (European Commission, 2011).

The first steps in this regard started since the 1st January 2007, date from which under the new legislation entered into force at that time, the permissible SOx level from fuels used in our country reduced from 150 mg / kg to 50 mg / kg in case of gasoline and 350 mg / kg to 50 mg / kg in case of gas oil (National Environmental Protection Agency, 2008).

The ways of achieving the GHG reduction levels would be implementing green logistics initiatives identified in the scientific literature (Tacken, Rodrigues & Mason, 2014).

Professor Alan C. McKinnon the Director of Logistics Research Centre at Heriot Watt University in Edinburgh, UK, in "Forecasting the carbon footprint of road freight transport in 2020" investigates the basic tendencies in logistics and supply chain management including the green logistics initiatives and the associated effects on the environment until 2020, based on the factors influencing the demand for freight transport services, fuel consumption and CO2 emissions related to trucks.

Professor Alan C. McKinnon argues that in order to achieve the growth limitation of the global average temperature below 2 ° C until 2100, the GHG emissions worldwide must be reduced by 50% until 2050.

These will require strong fuel pricing mechanisms than nowadays, as well as more stringent regulations for further reduction of carbon emissions.

Through the specific objectives of the Romanian National Strategy for Sustainable Development horizons 2013-2020-2030, on the six priority areas that integrate the sustainable development requirements, we find as second priority "Bringing the basic infrastructure to EU standards focusing on sustainable development and infrastructure means of transport by reducing environmental impact, promoting intermodal transport, improving traffic safety and the protection of critical infrastructure elements" (Romanian National Strategy for Sustainable Development Horizons 2013-2020-2030, 2015).

Also, in this document "the development of transport infrastructure with emphasis on rail, river and sea while maintaining a fleet of vehicles, including automobiles, physically and morally obsolete" is indicated among the main culprits for modifying the composition and ecological structure of Romania's natural capital.

However, it should be taken into account that the transfer of significant amounts of freight on short distances from road to rail or by intermodal transport could increase the transit time and the transportation costs by several times (Cutler, 2010).

Global warming and GHG emissions, such as carbon dioxide (CO2) lead in international climate change concerns. These emissions force and change the energy balance on earth and lead to a variety of climate problems (Corbett & Winebrake, 2010).

Figure 1 shows the share of CO2 emissions from economic activities in various fields. As can be seen, the transportation sector has a significant share in the total of CO_2 emissions in 2012, registering a value close to that generated by industrial processes. Also, considering the European level, Romania is a country with a very high level of CO_2 emissions in the transportation sector (Figure 2), it should make further efforts to meet the objectives of various environmental strategies.

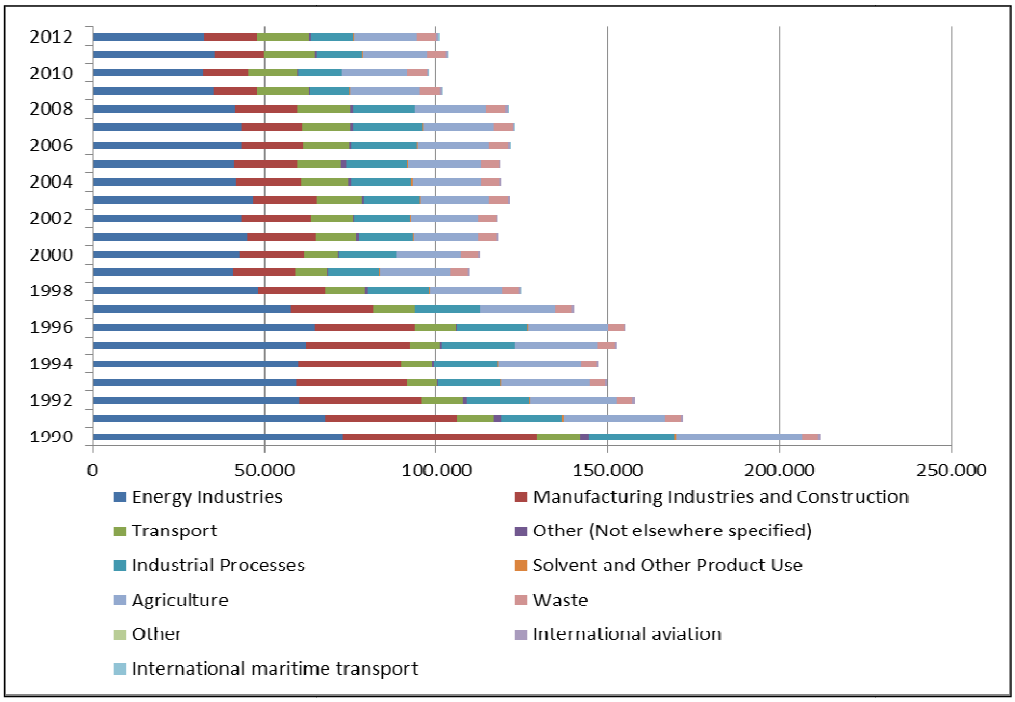

Figure 1: The share of CO_2 emissions from transport compared to other activities, data source: Eurostat databases

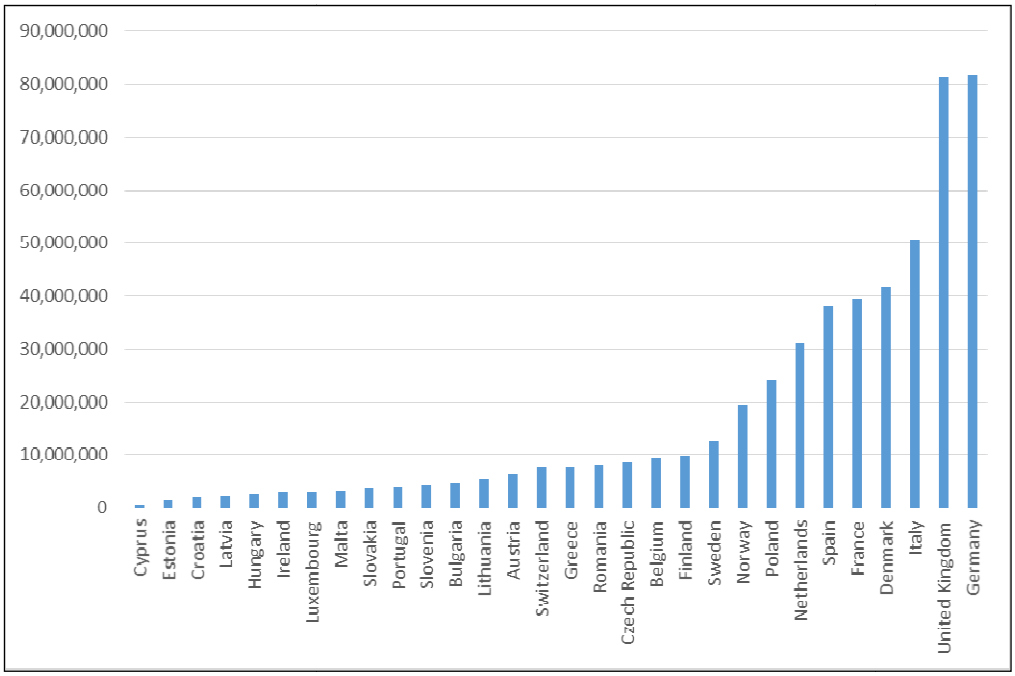

Figure 2: CO_2 emissions from transport (tonnes), data source: Eurostat databases

Therefore, the aim of this paper is to verify whether, beyond these figures from European countries, there is also a real interest for such an evolution of the intermodal mix in Romania.

In other words, if in the case of Romania there is a clear and stable correlation between the CO_2 emissions and the priority development of certain modes of transport (railway in particular).

If the answer is true, this means that the Romanian policy makers should study the leverages that could encourage the development of this priority modes, respecting at the same time the harmoniously intermodal mix. The purpose is to find possible solutions regarding the reduction of greenhouse gases and their effects.

There are many methods by which one can analyze the long-term dependency between CO2 emissions and the amount of transported goods, such as the combined cointegration test developed by Bayer C, proposed by Hancke C (Shahbaz, Khraief & Jemaa, 2015), or the available modeling tools to analyze the CO2 emissions from transport proposed in "Approaches and Techniques for Modelling CO2 emissions from Road transport" (Linton, Grant-Muller & Gale, 2015). However, the authors considered that in the case of Romania, the chosen calculation method is easier to apply and interpret for the existing time series.

Althought there is a long tradition of building large macroeconomic models with hundreds of equations and variables, recently, small models with only a handful of equations and variables have become more common (Bank of Sweden Prize in Economic Sciences in Memory of Alfred Nobel, 2003). Thus, the authors chose to analyse the long term relationship between CO2 emissions and the amount of goods transported by road, railway and water throught the Engel-Granger framework, the most common and popular framework used in long run relationships analysis (Utkulu, 2012).

Chapter 3 illustrates the obtained results and their discussion (in particular that it has been found a long term relationship between the CO_2 emissions and the quantity of goods transported by rail in Romania). The last chapter presents the conclusions and suggests based on the literature review some possible lines of decision.

Methodology

The data used cover the 1990-2012 period in Romania. The CO_2 emissions have been gathered from the United Nations statistical database and the transportation related variables from the National Institute of Statistics TEMPO Online database.

In order to analyse the data series two methods have been used: the Engel-Granger two steps methodology and the Pearson coefficient. If the data series are non-stationary, then the Engel-Granger Methodology is suitable for the analysis, thus this has been employed; if the data series are stationary, then the Engel-Granger Methodology is not suitable for the analysis, thus the Pearson Coefficient has been employed. Both methods provide information on the relationship between the modal split of transports and the CO_2 emissions. Yet the first one verifies the existence of a long term relationship and the last one provides information on correlations.

Next a short description of the Engel-Granger Methodology, adapted from Lazăr (2011, p. 205-220) will be provided.

Firstly the series were tested for stationarity using the Augmented Dickey Fuller test.

The hypothesis of the test were:

$$H_0 = The\ data\ set\ has\ a\ unit\ root\ (is\ not\ stationary)$$

$$H_1 = The\ data\ set\ is\ stationary$$

The p-value set for the test is 0,05. The test was performed using the E-views package. If the p-value computed is lower than 0,05, then the null hypothesis is rejected, so the series are stationary;

Next the existence of a linear combination between the variable pairs was tested. The pairs were formed between the non stationary variables as follows: CO_2_emissions_vs_railway_transport, CO_2_emissions_vs_sea_transport, CO_2_emissions_vs_inland_waterways_transport.

A simple regression was calculated between these variable pairs.

The equations resulted were:

$$CO2\ emissions_i = \alpha * amount\ of\ goods\ transported\ by\ rail_i + \beta + r_{1i}$$

$$CO2\ emissions_i = \alpha * amount\ of\ goods\ transported\ by\ sea_i + \beta + r_{1i}$$

$$CO2\ emissions_i = \alpha * amount\ of\ goods\ transported\ by\ inland\ waterways_i + \beta + r_{1i}$$

The equations verify the influence of the modal split of transport on the CO_2 emissions. The resulted residual series were then tested using the Augmented Dickey Fuller test. If the respective residual series are stationary, one can conclude that there is a linear combination between the selected variable pairs; thus there is a long term relationship between them.

The lag chosen for implementing the Augmented Dickey-Fuller Test was 3, the maximum lag that the amount of data allows.

As the CO_2 emissions series was not stationary, in order to test the existence of a correlation between them and the quantity of goods transported by road (the case where the data series are stationary), the first difference was employed, in order to stationarize the time series.

The Pearson coefficient, employed when the Engel Granger methodology was not appropriate, was computed using the IBM SPSS 20 package. The p-value set for the test was 0,05.

If the calculated p-value was below 0,05, there was a significant correlation between the variables. Moreover, if the coefficient is positive, the correlation is direct; otherwise, the correlation is indirect.

Research results

Table 1 presents the results of the Augmented Dickey Fuller test, employed in order to test the series for stationarity. As one can observe, the series considering the CO_2 emissions, the quantity of goods transported by inland waterways, by sea and railways are not stationary at level, but are stationary in the first difference. The series considering the quantity of goods transported by road is stationary. The first set of series will be employed in the Engel-Granger methodology and the second one in the Pearson coefficient calculation.

Table 1: Augmented Dickey-Fuller test for the selected variables, source: designed by the author

Variable	Augmented Dickey-Fuller test P value of the equations' residuals and Equations' coefficients	P value Level	P value First difference
CO2 Emissions	Trend and intercept	0.1499	0.0003
	Intercept	0.9598	0.0000
	None	0.9886	0.0000
Railway_transport	Trend and intercept	0.1341	0.0152
	Intercept	0.3011	0.0026
	None	0.0840	0.0002
Sea_transport	Trend and intercept	0.6462	0.0102
	Intercept	0.5282	0.0026
	None	0.3252	0.0001
Inland_waterways_transport	Trend and intercept	0.1909	0.0013
	Intercept	0.7688	0.0002
	None	0.7730	0.0000
Road_transport	Trend and intercept	0.0000	0.0000
	Intercept	0.0000	0.0000
	None	0.0000	0.0000

Table 2 presents the results of the regressions performed between the pairs of non-stationary series: the Augmented Dickey Fuller test results for the residuals, the equation's coefficients and the p-value for the

coefficients' significance test. As one can observe, there is a negative long term relationship between the CO_2 emissions and the quantity of goods transported by railway.

A positive long term relationship could be observed only between the quantity of goods transported by sea and the CO_2 emissions. A similar relationship is registered between the quantity of goods transported by inland waterways and the CO_2 emissions.

Table 2: Augmented Dickey-Fuller test P value of the equations' residuals and Equations' coefficients using the selected variables, source: designed by the author

Equation name **(dependent variables stated first)**	**Augmented Dickey-Fuller test P value of the equation's residuals**			**Equation's Coefficient**
	Trend and intercept	Intercept	None	
CO_2_emissions_vs_railway_transport	0.1489	0.2171	0.0280	-0.0180
CO_2_emissions_vs_sea_transport	0.0034	0.3138	0.0472	0.0514
CO_2_emissions_vs_inland_waterways_transport	0.0382	0.0153	0.0009	0.1940

Next the authors calculated the correlation coefficient and the correspondent p-values. There is a significant correlation between the rhythm of CO_2 emissions and the rhythm of quantity of goods transported by road in Romania, which suggests that this mode, though indispensable, is less priority in the development of new intermodal mix.

Conclusions and recommandations

As indicated in the Romanian National Strategy for Sustainable Development as national objective for the 2030 time horizon the following will be necessary: "The alignment to the average performance of the EU's energy and climate change indicators; the fulfillment of the commitments regarding the reduction of GHG emissions and the implementation of some measures to adapt to climate changing effects, namely the promotion of a transport system that can facilitate the safe, fast and efficient movement of people and goods."

In accordance to what stated before, the functioning of the transport system should be ensured so that it meets the economic, social and environmental needs of society while reducing the unwanted environmental impact to the minimum.

Taking into account the outcome of the analysis of this paper, that between CO2 emissions and the amount of goods transported by rail there is a negative relationship on long term, it would be desirable for Romania to look for ways so that the freight transport to be done mainly using railways.

Given the current context, the main cause for the slow development of intermodal transport are the high costs charged by the main railway operator in the country and the relative rigidity of the intermodal transport system.

Despite all these potential drawbacks, one way to achieve the reduction levels of GHGs would be to implement EU standards for intermodal transport or for the combined transport through the development of logistics platforms in seaports and Danube ports, of multi-modal cargo platforms on international airports and on other airports specialized in goods operations. Another way can be the increase of the accessibility of rail transport in ports as well as multimodal logistics platforms at national border crossings, in order to reduce GHG emissions, ensuring the transit transport of freight vehicles by rail through Romania.

Abstract

The funding practice of research today is allocated based on the real performance where it has become one of the major components of the funding mechanism in order to encourage R&D excellent. Research and development (R&D) is the basis of technology advancement for future developments in any field. The goal of research funding is clearly to finance the development of new ideas and technologies which include a wide spectrum of any research areas. The range covers all the research areas from the basic research in natural sciences, new technologies, information and communication technologies, environmentally friendly sustainable development, and research funding at Higher Education Institutions (HEIs) to support the transfer of the latest and recent innovation and technology.

Keywords: Research and development, funding, performance based grant

1. Introduction

In recent decades, universities research funding has changed in many countries. Despite the fact, financial support from the federal government is the biggest portion for research funding and will allow public universities to keep low tuition fees for students and thus can attract higher students' enrolment. Accordingly, Kuo and Ho (2008) added that government funding for public universities will help to train and guide postgraduate and professional students to produce innovation in research. In Malaysia, in order to enhance innovations and research development progress, government has provided financial support to the public universities. As highlighted in Malaysian Budget Speech 2013, RM 600 million was allocated to five research universities in Malaysia for the purpose.

However, in past few years, the trends have shown that there were decreasing in government financial support to the public universities. According to Auranen and Nieminen (2010), the shares of direct government funding for public universities has decreased gradually. Results from previous studies have shown that most public universities in many countries have faced declining trend of government funds to finance their operating expenses and research (Faridah, 2014). The shift into sharing the cost of funding higher educational sector

between the stakeholders comprises of the government, parents, students and institutions/philanthropists have been accepted and practiced in a number of countries. The method of totally dependent upon financial support from the government or public fund deem not feasible in the light of the global phenomenon of an increase cost of higher-education provision, and the diminution of expenditure allocated to the sector (Asharaf, 2013).

As pointed out by Malaysian Prime Minister, Datuk Seri Najib Tun Abdul Razak in 2016 budget speech, RM 250 million will be allocate for Ministry of Higher Education (MoHE) for their operation activities. The allocation shows decreasing about 15 percent compared to 2015 budget speech (Bank Negara Malaysia, 2015). Due to the decreasing amount of funds, public universities need to find other alternatives to find funding sources includes of research funding sources. According to Jongbloed (2008), a lot of universities in US and Europe looking at performance-based funding mechanism and the mechanism will enable universities to generate external income for their entrepreneurs' activities. In Malaysia, the government plans to introduce performance-based research funding with the aim to make public universities to become more competitive in their efforts to get external funding as a quality benchmark in research programmes (Ahmad and Farley, 2012).

Therefore, the current situation clearly demonstrates that funding of higher education in Malaysia shows the challenges in the provision of public funds to maintain the increase in operating costs and subsidize public university loan scheme to the student.

2. Research Funding Sources Categories

Research funding is divided into two groups which is commercial and non-commercial. For the commercial funding, the sources of funds come from the industrial and private companies which the research may covers the areas that needed by the industries for their technology advancement from time to time and specifically for the business purposes. In view of non-commercial categories, the funds normally come from the government in each countries and also known as public funding. The funds also may come from any research councils, charities unity or any internal scheme if any.

According to Faridah (2014), for non-commercial categories or known as public funding, it can divided into three categories; (1) government funds; (2) funds from private business entities; and (3) funds from other sources [funds received from foreign-based organizations and corporations and the internally-generated funds]. Further, Faridah (2014) added that government funds have contributed more than 60 percent of the total funds required by the universities. Refer to previous research, the research funding sources found similar with research conducted by Ahmad and Farley (2013) and Hagedoorn et. al (2001) that found out research universities will dependant largely on government funding for their operation activities than other sources.

Strehl, Reisinger and Kalatschan (2007) on their study of funding systems and their effects on higher education systems have summarise the overall effects of funding system in supporting the achievement of university goals and their strategic ways as follows:

i. The new funding system leads institutions behaviour in order to achieve desired goals;
ii. The proposed strategy aims at refining and providing institutions greater focus on improving the quality of teaching and research;
iii. The intention to achieve changes at greater degrees in a new era and knowledge- based; and
iv. With the complex challenges faced by institutions, implementation of new management instruments are seen as major overall goals and challenges to achieve the main university goals.

Funding mechanism and their impact on research and teaching however have shown different implications and effect. For the research universities, the key indicators of performance are the ability of the institutions to generate revenues from all sources. Therefore the funding research strategy is desired objectives for the research university (Litwin 2006). Therefore, funding system of higher education has an intended and unintended effect on the basic core tasks teaching and research in institutions (Tammi 2009). This effect has been summarised by Strehl, Reisinger and Kalatschan (2007) in their study on funding system and their effects on higher education systems. These includes as follows:

i. Positive effects of funding

- Greater autonomy, performance, and competition;
- Increase the level of effectiveness, efficiency, and transparent of HEIs;

- Increase the need to more internationalisation;
- Improved the quality services;
- Innovative in develop curricula;
- Enhanced better cooperation with other institutions;
- The attention to be more on customer orientation;
- Flexibility in budget; and
- Provide incentive for development and change.

ii. Negative effects of funding

- Reduce mix of research and teaching;
- Elimination of studies presently not in demand;
- Reduce incentives to do basic research;
- Negative steering effect through indicators in formulas; and
- Lesser quality of teaching and research

2.1 Definition of Research

In general, a research study is conducted to collect and analyse information for the purpose of understanding of a certain topic or any issue. According to Ellis and Levy (2008), research can contribute to a body of knowledge in four ways; (1) Establish cause and effect relationship between the study variables; (2) Make the assessment of an approach to deal with any problems; (3) In-depth study of the effectiveness of a new approach and (4) Develop a predictive model in the approach to solve problem that have been identified.

According to Tina (2009), research definition in the lens of higher education system is important because measuring research quality is a complex process and need deep understanding knowledge-based in each field involved. In line with PBRF concept, research can be seen as an independent in a way of long-term activity conducted by people with specialist knowledge about the theories, methods and information concerning their field of enquiry. Here, the research findings must be open to scrutiny and formal evaluation by others in the field, and this may be achieved through publication (Shin, 2009).

Changes in educational systems have lead many countries to restructure their resources to finance higher education and ensure it aligns with overall government strategic planning (Johnstone 1998), in order to compete in the competitive global environment. As a result, almost all countries today rely on large scale government funding to improve the quality of higher education (Roger 1995).

3. Overview of Performance-Based Research Fund

The PBRF is intends to increase the average quality of research, ensure that research continues to support degree and postgraduate teaching, ensure that funding is available for postgraduate students and new researchers, and to improve the quality of information on research outputs (PBRF Assessment Report, 2012).

In today, challenging environment, the cost of providing HE services is very costly. As per today, lots of countries in the worlds have come out with the funding reform to funding HEIs. To create more transparent funding system, the move to implement performance-based competitive funding mechanism is positive steps to improve the accountability and of HEIs.

3.1 Background to the Performance-Based Research Fund

In recent years, most of government are interested in performance based funding in the research institutions. As pointed out by Ahmad, Farley and Naidoo (2012), changes in the education system have caused many countries to restructure their resources in funding higher education institutions and to ensure that it is consistent with the government's overall objectives. The results from government decision in funding reforms have influences the decision of public funding, the universities development strategies and the academic's incentives and employment prospects.

In line with the reformations, performance-based research fund [PBRF] is one of novelties that have been introduced (Diana, 2011). In New Zealand, the PBRF processes have produced evaluations of HEIs based on the assessment by expert panels of the research portfolios submitted by individual academics. The outcomes and

the overall process have a very significant impact on the incentives faced by the academics, research outputs and the staffing of New Zealand's HEIs.

4. Conclusion

As stated before, PBRF is a new reformation of research assessment funding model designed by Ministry of Education in New Zealand. Nationally, various countries have introduced PBRF models in their HEIs for research activities; however it were designed differently according to the needs of each country (Siamah, 2009). UK was the the first country introduced the performance research funding system called Regular Research Assessment Exercises (RAEs) by the UK funding council in the mid-1980s. RAE described as an 'ex post evaluation' that based on 'informed peer preview' which it provides an assessment of the quality of academic units in all subjects where research was conducted, and these assessments are used in their funding determination (Guena and Martin, 2003). Furthermore, according to Hare (2002), the UK RAE model is version of PBRF model with longest track record since it were evaluated each 5 years and the latest, The British Government announced to replace RAE after 2008 with new developed system – the Research Excellence Framework (REF)- for the funding of research assessment.

In Australia, the research funding model known as Research Quality Framework (RQF) that launched in 2004, and further reviewed to a new system called Excellence in Research for Australia (ERA) in late 2007, both system defined as a framework model for assessing research quality and their impact, ensure that public funding has been invested in research field that will provide benefits to the community (Anderson, 1999). Further, Anderson (2009) added that RQF is to bring the public funding of research in line with government policy for funding determination by the results achieved. As used in UK and Australia, New Zealand is the country that the most recent country developed the system into their tertiary education called Performance Research Fund. PBRF is a funding process which assessing the research performance and the funding determination will be on the basis of their performance.

Abstract

We propose a model to calculate optimal tariff rate taking into consideration the correlation between the intensity of customer flow and tariff size. Two models were considered: the tariff rate depends on insurance sum and the tariff rate does not depend on insurance sum. Implementation of developed models will enable insurance companies to conduct competitive tariff policy.

Keywords: insurance, risk-related insurance types, tariff, tariff rate, optimal tariff rate. loss, insurance benefit.

Introduction

Insurance Companies In Their Activity Shall Take Into Consideration The Laws Of Market Economy Which Imply Competition And Fight For A Market Place. Competitive Insurance Market Affects Company Ability To Successfully Attract New Customers And Retain Existing Ones By Reducing Tariff Rates. Practically, The Lower The Tariff Rate Is, The More Attractive The Company Is. Accurate Tariff Calculation Has An Influence On Successful Performance Of A Company.

One of the major problems of an insurer is to calculate insurance costs for a particular property, particularly, to determine initial cost and the cost of insurance service. All calculations are based on insurance tariffs and tariff rates. Thus, the tariff has to be as correct as possible in relation to loss coverage per insured person or per exposure unit.

If a tariff rate reflects probable loss precisely, the loss is accurately allocated between insured people. Tariff rate also determines responsibility of an insured person. In other words, insurance tariff is a criterion to state insurance fund which guarantees profitability of insurance activity. An insurance company's main function is to make a profit and an insurer does his best to find an optimal solution to increase insurance responsibility and to minimize tariffs. Reasonable tariff rates ensure financial strength of insurance operations (balancing costs and revenues or raising revenues and cutting costs) and withdrawal of revenue fraction in the form of insurance payment which is acceptable for an insured person (Landsman Z., 2001., Washington S., 2011.). Consequently, scientifically calculated insurance tariffs make it possible to determine the optimal size of an insurance fund as a necessary condition for successful insurance business development (Paefgen J., 2013., Denuit M., 2013.).

This paper is aimed at calculation of optimal tariff rate for property insurance taking into consideration the dependence of its rate on the number of customers (Train K.E., 2003., Dhaene J., 2013., Diers D., 2013.).

Insurance model

For instance, a client wants to ensure his property for the sum *S*. Due to the fact that a client can choose between different amounts of insured sums, *S* is the random variable with the probability coefficient $p_s(S)$. A client has to pay for services provided by insurance company (the sum $T(S)S$ where $T(S)$ is a tariff rate which depends on the random variable).

Let us assume that probability of loss is *q*. In this case damage size equals *X*, and we may expect that the loss variable is random. Thus, the variable *X* is random as well, with the probability coefficient $p_x(x)$.Owing to the fact, that a client insured his property for the sum *S*, the following model may be used for insurance benefit variable (without franchise):

$$\mathrm{Y} = \begin{cases} \mathrm{X}, & if\ \mathrm{X} \prec S, \\ S, & if\ \mathrm{X} \geq S. \end{cases} \qquad (1)$$

Therefore, probability coefficient $\mathrm{P}_y(y)$ of the random variable *Y* is:

$$\mathrm{P}_y(y) = P_x(y) + \delta(y - S)\int_S^{\infty} P_x(x)\,dx, \qquad 0 \leq y \leq S \qquad (2)$$

Thus, conditional expectation of the damage compensation variable *Y* for fixed *S* equals:

$$\mathrm{M}\{\mathrm{Y}|S\} = \int_0^S x p_x(x)dx + S\int_S^{\infty} p_x(x)dx, \qquad (3)$$

and the expectation of loss payment variable equals:

$$\mathrm{M}\{\mathrm{Y}\} = \bar{\mathrm{Y}} = \int_0^{\infty} \mathrm{M}\{\mathrm{Y}|S\} p_s(S)dS\,. \qquad (4)$$

Fixed tariff rate

Tariff rate is the price an insurance company charges for its services, it is the cost of insurance coverage. Tariff rates make it possible to calculate insurance payments paid by insured people and the amount of payment (premium) taking into consideration total insurance sum. Calculating insurance tariffs is important to determine probable amount of damage per each insured person or per exposure unit (Varian H., 1988.). Thus, the tariff has to be calculated as accurate as possible so that payment amount would be enough to cover losses of an insured person taking into account prescribed terms of insurance contract. If a tariff rate reflects probable loss precisely, the loss is accurately allocated between insured people (Dutta J., 2002.). Tariff rates cover a one year period and are calculated and approved annually.

Calculating revenue per customer

Let us have a closer look at the case when the tariff rate $T(S)$ does not depend on the variable *S* ,it is constant. Then, revenue per customer equals $\Pi = TS - IY - \Delta$, where *I* is an indicator of loss occurrence. Thus:

$$\mathrm{I} = \begin{cases} 1, & \text{if the loss occurred,} \\ 0, & \text{if the loss did not occur,} \end{cases}$$

and Δ – customer service costs (cost per customer).

Let us find probabilistic characteristics of the variable Π. Generalizing we get:

$$\mathrm{M}\{\Pi\} = \mathrm{T}\bar{S} - q\bar{\mathrm{Y}} - \Delta\,, \qquad (5)$$

where $\bar{S} = M\{S\}$. Then, if Δ=0 (calculating variance, we do not take into consideration Δ, because it is constant). Thus, we have: $\Pi^2 = T^2S^2 + IY^2 - 2TSIY$, and in this case

$$\mathrm{M}\{\Pi^2\} = \mathrm{T}^2\mathrm{M}\{S^2\} + q\int_0^\infty \mathrm{M}\{\mathrm{Y}^2|S\}p_s\{S\}dS - 2q\mathrm{T}\int_0^\infty S\mathrm{M}\{\mathrm{Y}|S\}p_s\{S\}dS,$$

where

$$\mathrm{M}\{\mathrm{Y}^2|S\} = \int_0^S x^2 p_x(x)dx + S^2\int_S^\infty p_x(x)dx.$$

Consequently, we can calculate the profit variance per customer:

$$D\{\Pi\} = \mathrm{T}^2 D\{S\} - 2q\mathrm{T}\,\mathrm{cov}(\mathrm{Y},S) + q\int_0^\infty \mathrm{M}\{\mathrm{Y}^2|S\}p_s(S)dS - q^2\bar{\mathrm{Y}}^2, \quad (6)$$

where

$$\mathrm{cov}(\mathrm{Y},S) = \int_0^\infty \mathrm{MM}\{\mathrm{Y}|S\}p_s(S)dS - \bar{\mathrm{Y}}\bar{S}.$$

Calculation of insurance portfolio return and determination of optimal tariff rate

Let us assume that insurance field (the maximum number of customers who buy insurance) equals N_0. In this case a client may go to a particular company to buy insurance with a probability $\pi(T)$ and this probability certainly depends on tariff rate T and it is monotonically decreasing if T is increasing (ZhiYi Lu, LePing Liu, etc. 2012., Panjer H.H., 1992.).

Let us assume that the total number of customers who wanted to buy insurance is N. The following formula may be used to calculate the return of insurance portfolio.

$$\Pi_\Sigma = \sum_{i=1}^{\mathrm{N}} \Pi_i,$$

where Π_i –the return of i's customer. Thus:

$$\mathrm{M}\{\Pi_\Sigma|\mathrm{N}\} = \mathrm{N}(\mathrm{T}\bar{S} - q\bar{\mathrm{Y}} - \Delta), \quad \mathrm{M}\{\Pi_\Sigma\} = \mathrm{N}_0\pi(\mathrm{T})(\mathrm{T}\bar{S} - q\bar{\mathrm{Y}} - \Delta), \quad (7)$$

as $\mathrm{M}\{N\} = N0\ \pi(T)$. If we want to maximize our profit, we have to choose the tariff rate taking into consideration that:

$$\mathrm{N}_0\pi(\mathrm{T})(\mathrm{T}\bar{S} - q\bar{\mathrm{Y}} - \Delta) \Rightarrow \max_{\mathrm{T}} \quad (8)$$

If we set the T-derivative equal to zero, we can determine optimal tariff rate according to the following principle.

$$\mathrm{T} + \frac{\pi(\mathrm{T})}{\pi'(\mathrm{T})} = \frac{q\bar{\mathrm{Y}} + \Delta}{\bar{S}}. \quad (9)$$

To solve the equation we should know the dependence $\pi(T)$ which can be determined based on econometric measurements. Let us have a closer look at illustrative example when $\pi(T) = \exp(-T/\kappa)$. Then, equation (9) gives:

$$T = \frac{q\bar{Y} + \Delta}{\bar{S}} + \kappa . \qquad (10)$$

Ruin probability

Determining the probability of ruin and time to ruin are important problems in classical risk theory. The classical risk model (dynamic model) is widely studied in the actuarial literature. Possibility to sign an insurance contract at a particular point in time creating a random process is considered in the framework of this theory. Every contract has its duration and losses may occur within the contract period. Thus, major cash outflows affect the operations of an insurance company when we consider claims. To calculate ruin probability of an insurance company, we should know the distribution law of the amount of payments to insured people. It is possible to develop an analytic formula of ruin probability in some particular cases (for instance, when claim payments have exponential distributions). For other types of distributions ruin theory uses different methods of evaluation which are developed taking into consideration certain restrictions (Kudryavtsev A., 2009., Yang Yang, 2011, 2012.). Thus, a well-known Cramér–Lundberg approximation does not exist for payments that fall under lognormal distribution law. These models shall be analyzed applying simulation modeling.

Let us assume that company ruin is the event $\Pi\Sigma < 0$ and the probability $P\{\Pi\Sigma < 0\} = Pd$ of this event is called company ruin probability. Let us calculate this variable.

To calculate this variable, we have to calculate the dispersion of the variable Π_Σ. We have:

$$\Pi_\Sigma^2 = \sum_{i=1}^{N} \Pi_i^2 + \sum_{i \neq j} \Pi_i \Pi_j .$$

Customers are independent. We can denote it as follows:

$$M\left\{ \Pi_\Sigma^2 \middle| N \right\} = NM\left\{\Pi^2\right\} + N(N-1)M\{\Pi\}^2 .$$

Generalizing N we get:

$$M\left\{\Pi_\Sigma^2\right\} = M\{N\}M\left\{\Pi^2\right\} +$$

$$\left(M\left\{N^2\right\} - M\{N\}^2\right) M\{\Pi\}^2$$

Calculating $M\{\Pi_\Sigma\}^2$ and taking into consideration the properties of binomial probability distribution, we have:

$$D\{\Pi_\Sigma\} = N_0 \left\{ \begin{matrix} \pi(T) D\{\Pi\} + \pi(T) \\ (1 - \pi(T)) M\{\Pi\}^2 \end{matrix} \right\} . \qquad (11)$$

To calculate P_d let us denote that at larger $N_0\pi(T)$ due to central limit theorem, the variable Π_Σ can be considered as the normal random variable.

Let us assume that x is a normal random variable with $M\{x\} = a$ and $D\{x\} = \sigma^2$. In this case:

$$P\{x < 0\} = \int_{-\infty}^{0} \frac{1}{\sqrt{2\pi\sigma}} \exp\left(-\frac{(x-a)^2}{2\sigma^2} \right) dx =$$

,

$$\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{-a/\sigma} \exp\left(-\frac{t^2}{2} \right) dt = \Phi\left(-\frac{a}{\sigma} \right)$$

where $\Phi(-)$ is Laplace's function. Ruin probability in this case:

$$P_d = \Phi\left(-\frac{M\{\Pi_\Sigma\}}{\sqrt{D\{\Pi_\Sigma\}}} \right), \qquad (12)$$

where $M\{\Pi_\Sigma\}$ and $D\{\Pi_\Sigma\}$ are calculated by using the formulas (7) and (11).

Variable tariff rate

Calculating revenue per customer

Let us assume that the tariff rate is the function of S and J is an indicator of an event (whether a potential customer signed the insurance contract or not). It looks as follows:

$$J = \begin{cases} 1, & \text{if a customer signed insurance contract,} \\ 0, & \text{if a customer did not sign insurance contract.} \end{cases}$$

In this case the probability of $J=1$ equals $\pi(\mathrm{T}(S))$.

Accordingly, revenue per potential customer can be calculated by the following formula:

$$\Pi = J\left(\mathrm{T}(S)S - \mathrm{IY} - \Delta\right). \qquad (13)$$

Probabilistic characteristics of this variable can be found. We have:

$$\mathrm{M}\{\Pi|S\} = \pi\left(\mathrm{T}(S)\right)\left(\mathrm{T}(S)S - qM\{\mathrm{Y}|S\} - \Delta\right),$$

having generalized S we get,

$$\mathrm{M}\{\Pi\} = \int_0^\infty \pi\left(\mathrm{T}(S)\right)\left(\mathrm{T}(S)S - q\mathrm{M}\{\mathrm{Y}|S\} - \Delta\right) p_s(S)\,dS \qquad (14)$$

Then,

$$\Pi^2 = J\begin{pmatrix} \mathrm{T}^2(S)S^2 + \mathrm{IY}^2 + \Delta^2 \\ -2\mathrm{T}(S)S\mathrm{IY} - 2\mathrm{T}(S)S\Delta + 2\mathrm{IY}\Delta \end{pmatrix},$$

Thus,

$$\mathrm{M}\{\Pi^2|S\} = \pi\left(\mathrm{T}(S)\right)(\mathrm{T}^2(S)S^2 + q\mathrm{M}\{\mathrm{Y}^2|S\} + \Delta^2 -$$

$$-2q\mathrm{T}(S)S\mathrm{M}\{\mathrm{Y}|S\} - 2\mathrm{T}(S)S\Delta + 2q\mathrm{M}\{\mathrm{Y}|S\}\Delta)$$

Generalizing S we get:

$$\mathrm{M}\{\Pi^2\} = \int_0^\infty \pi\left(\mathrm{T}(S)\right)\left[\mathrm{T}^2(S)S^2 + q\mathrm{M}\{\mathrm{Y}^2|S\} + \Delta^2 -\right.$$

$$\left. -2q\mathrm{T}(S)S\mathrm{M}\{\mathrm{Y}|S\} - 2\mathrm{T}(S)S\Delta + 2q\mathrm{M}\{\mathrm{Y}|S\}\Delta\right] p_s(S)\,dS \qquad (15)$$

and $D\{\Pi\} = \mathrm{M}\{\Pi^2\} - \mathrm{M}\{\Pi\}^2$.

Calculation of insurance portfolio return and determination of optimal tariff rate

Let us assume that insurance field (the maximum number of customers who buy insurance) equals N_0. In this case company profit can be determined in the following formula:

$$\Pi_\Sigma = \sum_{i=1}^{N0} \Pi_i, \qquad (16)$$

where Π_i – the return of i's customer. Thus:

$$\mathrm{M}\{\Pi_\Sigma\} = \mathrm{N}_0 \mathrm{M}\{\Pi\} =$$

$$= \mathrm{N}_0 \int_0^\infty \pi\big(\mathrm{T}(S)\big)\big(\mathrm{T}(S)S - q\mathrm{M}\{\mathrm{Y}|S\} - \Delta\big) p_s(S)\, dS \quad , \quad (17)$$

and the problem of determination of optimal tariff rate reduces to the problem:

$$\int_0^\infty \pi\big(\mathrm{T}(S)\big)\big(\mathrm{T}(S)S - q\mathrm{M}\{\mathrm{Y}|S\} - \Delta\big) p_s(S)\, dS \Rightarrow \max_{\mathrm{T}(S)} \quad . \quad (18)$$

Accordingly, it reduces to the problem:

$$\pi\big(\mathrm{T}(S)\big)\big(\mathrm{T}(S)S - q\mathrm{M}\{\mathrm{Y}|S\} - \Delta\big) \Rightarrow \max_{\mathrm{T}(S)} \quad . \quad (19)$$

If we set the $T(S)$ derivative of the left side (19) equal to zero, we obtain the equation that determines optimal tariff rate.

$$\mathrm{T} + \frac{\pi(\mathrm{T})}{\pi'(\mathrm{T})} = \frac{q\mathrm{M}\{\mathrm{Y}|S\} + \Delta}{S}, \quad (20)$$

In a particular case $\pi(\mathrm{T}) = \exp(-\mathrm{T}/\kappa)$ we get:

$$\mathrm{T}(S) = \frac{q\mathrm{M}\{\mathrm{Y}|S\} + \Delta}{S} + \kappa, \quad (21)$$

it can be defined as optimal tariff rate.

This relation can now be indicated as follows:

$$\mathrm{T}(S)S = q\mathrm{M}\{\mathrm{Y}|S\} + \Delta + \kappa S \quad (22)$$

we now can give clear economic interpretation of this relation: the amount of money an insured person must pay for services provided by an insurance company consists of three parts:

1. Mathematical expectation of loss coverage $qM\{Y/S\};$
2. customer service costs (cost per customer Δ);
3. «risk fees» in the amount of κS.

Ruin probability

As mentioned above, ruin probability is (Albrecht P., 1983.):

$$\mathrm{P}_d = \Phi\left(-\frac{\mathrm{M}\{\Pi_\Sigma\}}{\sqrt{D\{\Pi_\Sigma\}}}\right), \quad (23)$$

but $\mathrm{M}\{\Pi_\Sigma\}$ и $D\{\Pi_\Sigma\}$ shall be calculated by the following formulas:

$\mathrm{M}\{\Pi_\Sigma\} = \mathrm{N}_0 \mathrm{M}\{\Pi\}$ and

$D\{\Pi_\Sigma\} = \mathrm{N}_0 D\{\Pi\}$.

Conclusion

There have been few published research papers which put advanced theories into practical outcomes. However, these studies are in increasingly high demand. Implementation of developed models will enable insurance companies to conduct competitive tariff policy.

Abstract

This paper presents the study of the current situation in the labor market in Russia in respect to the level of education of the employed population. The study is based on materials of Russian Federal State Statistics Service. The dynamics of the number of students in professional education institutions in the period of 1991 – 2013 has been analyzed. Dynamic analysis of data on employees with higher education in the Russian economy for the period 2000 – 2014 was carried out. Based on the information on employment and real GDP, a forecast of future demand for specialists with higher education and real GDP for the period 2015 – 2025 was generated.

Keywords: labor market, forecasting, demand, specialists with higher education;

Introduction

In the 2000s, labor market in Russia has undergone major changes. One of the most interesting aspects of it is the ratio between supply and demand of highly skilled labor. Such authors as Schultz (1993), Hanushek (2013), Pelinescu (2015) reported that, there is a link between human capital and economic development. Also Gary S. Becker (1993), Kapelyushnikov R., Kuznetsov A., Kuznetsova O. (2012), Oppedisano V. (2014) mentioned that there is a strong relationship between education and labor market. Therefore, the question about the demand in workers with high qualification stands important in economy. Households invest in higher education because they hope to get a significant revenue growth due to better education. Companies tend to hire employees with better professional skills because generally they have higher productivity.

If demand exceeds supply, jobs with the high requirement to qualification are taken by low-skilled employees. In this case, labor productivity will decrease, and employee reward will exceed the efforts. If supply exceeds demand, highly skilled employees get jobs which don't require high skills. In this case, professional knowledge and skills remain unclaimed and efforts and investments in education don't pay off. Deviations from balance in labor market lead to considerable economic and social costs, both at the level of society, and at the individual level. Therefore, the level demand for high skilled employees for economy is very important. It also facilitates the development of national educational policy.

This paper presents the study of Russian economy demand for employees with higher education.

Analysis of current situation in the Russian economy

Supply of employees with higher education characterizes the current situation in the labor market. Table 1 presents data on the level of education among employees in 2014. (Russia in figures, 2015)

Almost a third of employees have higher education, three-quarters of the employees have a tertiary education. The share of low-educated employees is only 3.7%. Russian economy has a shortage of unskilled labor, which leads to employees with "excessive education" taking job positions below their professional level.

The structure of the educated labor force is characterized by significant sex asymmetry. Leaders are women, men are 5.6% behind. Women usually have higher motivation to pursue higher education. It is much easier for women with higher education to get a job. When it is easier for men to get a job and receive a decent salary without having higher education, especially at jobs which require physical labor.

Table 1: Distribution of the workers based on education level in 2014, in %

Employed in economy – total	100	100	100
Including workers who have education:	all	men	women
Higher education	32.2	28.5	36.1
Secondary professional education – total	44.8	45.2	44.5
- mid-level professionals	25.8	21.8	30.1
- skilled workers, employees	19	23.4	14.4
Secondary general education	19.2	21.8	16.5
Basic general education	3.5	4.2	2.7
Without basic general education	0.2	0.3	0.2

Data on the number of students provides insight into the dynamics of the potential labor supply in the future (Figure 1). The number of students enrolled in training programs for skilled workers and employees has been steadily falling. In the period 1991 – 2013 it fell by 2.3 times.

Different picture is presented by data on the number of students going through training programs for mid-level and higher education. The growth rate of the number of students on the programs of higher education is greater than the rate of growth in the number of students on training for mid-level professionals.

The number of students in higher education institutions in 2013 in comparison to 1991 increased twice from 2.76 million people to 5.65 million people whereas the number of students in training programs for mid-level professionals for the same period fell by about 2%. The maximum number of students in training programs for mid-level professionals was reached in

2004 and was 2.6 million people. And the greatest number of students in higher education institutions was in 2009 – 7.5 million people.

Data show that supply of skilled workers and employees was constantly decreasing, while the supply of mid-level and higher education was growing. Partially this dynamic can be explained by demographic situation. Studying in technical school for a lot of people of that period was the intermediate stage before study in higher education institution.

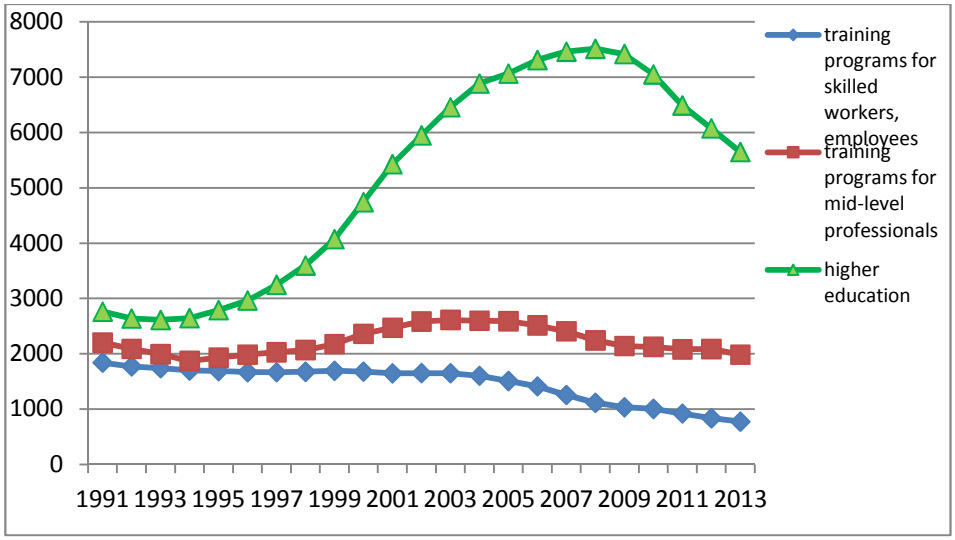

Fig 1. Changes in the number of students (in thousands of people) (Chart is built by authors and based on data of Federal State Statistics Service of Russia, 2014)

But significant decline of the number of students in training programs for skilled workers and employees is connected with falling of popularity of such kind of education, whereas attractiveness of the higher education sharply increased. People with higher education get considerable "reward" for it. So, according to the data provided by Russian Longitudinal Monitoring Survey (HSE) in the 2000 decade it fluctuated within 50-70%, and according to the data provided by National Survey of Household Welfare and Participation in Social Programs – 85%, according to the survey of wages by profession – 73-76%. For secondary professional education "reward" is much less – about 15% (according to survey of wages by profession). (Kapelyushnikov R, Gimpelson V. Russian worker: education, profession, qualification, 2011)

Forecasting demand for employees with higher education

Dynamic analysis of data provided by Federal State Statistics Service (Statistical Yearbook of Russia. 2010, 2014) generated following indicators: absolute growth, growth rate and rate of increase (table 2).

The results show that the proportion of employed and the number of employees with higher education have positive dynamics during the period 2000 – 2014. The greatest decrease in the number of employed with a higher education in the Russian economy, was in 2000-2001, -573,1

thousand people (-3,6%), and also in 2008-2009, -1372,2 thousand people (-6,6%). The greatest increase in the number of employed with a higher education was in 2006-2007, +1783,5 thousand people (9,4%).

The 2009 year "failure" is connected with decrease of the total number of employed due to crises in the national economy. In general, for the whole period under consideration the number of employed with higher education in the Russian Federation, increased approximately by 1,5 times. Detailed view of dynamics in the number of employed with higher education, is shown in the figure 2.

Table 2: The dynamic analysis of data on employed with higher education (Data is calculated by authors and based on data of Federal State Statistics Service of Russia)

Years	Number of employed in the Russian Federation, average per year, thousands of people	Share of employed with higher education, %	Number of employed with higher education, thousands of people	Absolute increase, thousands of people
2000	65 070.4	24.7	16 072.4	-
2001	65 122.9	23.8	15 499.3	-573.1
2002	66 658.9	23.4	15 598.2	98.9
2003	66 339.4	23.6	15 656.1	57.9
2004	67 318.6	24.9	16 762.3	1 106.2
2005	68 339.0	26.2	17 904.8	1 142.5
2006	69 168.7	27.4	18 952.2	1 047.4
2007	70 770.3	29.3	20 735.7	1 783.5
2008	71 003.1	29.5	20 945.9	210.2
2009	69 410.5	28.2	19 573.7	-1 372.2
2010	69 933.7	29.1	20 350.7	777.0
2011	70 856.6	29.8	21 115.3	764.6
2012	71 545.4	30.4	21 749.8	634.5
2013	71 391.5	31.7	22 631.1	881.3
2014	71 539.0	32.2	23 035.6	404.5

Fig 2. Dynamics of rate of increase in the number of employed with higher education, % (Chart is built by authors and based on data of Federal State Statistics Service of Russia, 2014)

In order to forecast future demand for specialists with higher education, it is necessary to build a trend based on the number of employed. Besides the forecast of real GDP needs to be calculated as the demand for specialists with higher education, directly depends on it.
To construct the trend, we will use simple linear equation:

$$y = a_0 + a_1 \times t \quad (1)$$

where the coefficients a_0 and a_1 are calculated by means of the system of equations:

$$n \times a_0 + a_1 \times \sum t = \sum y \quad (2)$$

$$a_0 \times \sum t + a_1 \times \sum t^2 = \sum t \times y \quad (3)$$

in which:
n – number of the periods according to which the trend is built;
$\sum t$ is defined by centering method and is equal to 0.
By means of extrapolation method it is possible to predict a rate of increase of specialists with higher education in economy and the forecast of real GDP.
For building the forecast, data from the table 2 was used.
As a result of the analysis linear equation was obtained:

$$y_1 = 19105{,}5 + 572{,}2 \times t \quad (4)$$

where y_1 – the number of employed in the economy, having higher education in thousand people, t - the year for which the calculation is carried out.

To predict the value of real GDP, the next equation is obtained:

$$y_2 = 35882{,}2 + 1438 \times t \quad (5)$$

where y_2 – the size of real GDP in billion rubles., t – the year for which calculation is carried out.
The forecast of the number of employed with higher education, and real GDP are presented in the table 3.

Table 3: Forecast data (Data is calculated by authors)

Years	The number of employed in the economy, having higher education in thousand people	Rate of increase of employed having higher education, in %	Size of real GDP in billion rubles	Rate of increase real GDP, in %
2015	23683.39	-	47385.96	-
2016	24255.62	2.4	48823.93	3.0
2017	24827.85	2.4	50261.9	2.9
2018	25400.08	2.3	51699.87	2.9
2019	25972.31	2.3	53137.83	2.8
2020	26544.54	2.2	54575.8	2.7
2021	27116.78	2.2	56013.77	2.6
2022	27689.01	2.1	57451.73	2.6
2023	28261.24	2.1	58889.7	2.5
2024	28833.47	2.0	60327.67	2.4
2025	29405.7	2.0	61765.63	2.4

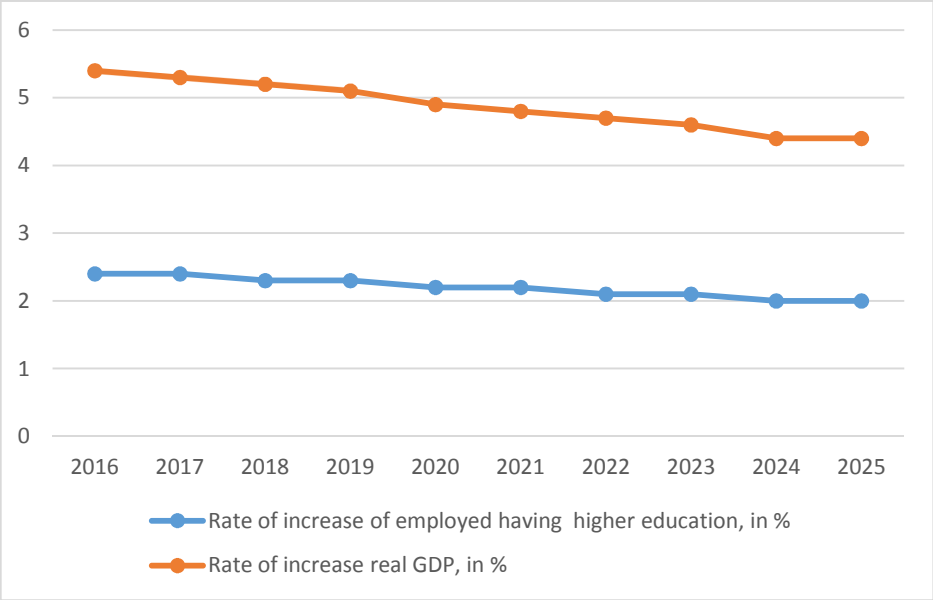

Fig 3. Dynamics of the rate of increase of employed with higher education and real GDP, in % (Chart is built by authors)

Having compared growth rates of employed with higher education and rates of economy development, it is obvious that increase in production is proportionate to the increase in the number of employed with higher education. So we can make a conclusion that the tendency of growth of employed with higher education will remain, but rates of increase will be slowing down.

Conclusion

In the 2000s, the demand and supply of workers with higher education grew very fast. It is explained, to a certain degree, by rapid growth of the Russian economy during this period. It is also necessary to consider that the demand for specialists with higher education in 90s due to the crisis fell sharply and people with higher education were forced to take jobs with low skills. If that fall didn't happen, growth rates of people with higher education later on wouldn't be so substantial.

Formally, Russia is among the most highly educated countries in the world. On the other hand, quality of Russian education remains low. This is supported by the development of intra-extramural forms of study, correspondence and remote forms of education, and also combination of study and work among students of full-time tuition. Moreover a lot of workers who obtained higher education don't work in field of their professional specialization and take jobs which don't require high skills level.

Thus, the analysis shows that the number of employees with higher education and their share is steadily growing. The forecast shows that the tendency of growth of people with higher

education will remain, but rates of increase will start to slow down. There is no reason to expect that the demand for labor with higher education will grow as quickly, as supply. This can lead to an imbalance in the labor market. It is necessary to correct educational policy in order to reduce the number of students who are trained in programs of higher education.

Abstract

The aim of the article is to analyze the relationship of the modern Internet space and the cultural memory. The analysis of cultural memory at the beginning of the XXI century underwent essential changes. The modern space of the cyberspace even more often acts as a source of obtaining the information, which has a decisive impact on the formation of mental structures of the modern society. The beginning of the third millennium is marked by basic change of research trajectories of the cultural memory. Specific research projects are put in the forefront. Nowadays the modern world considers the cyberspace as an independent component of the contemporary everyday life. So this work builds upon the given overview and establishes a theoretical construction between cyberspace and cultural memory. The study argues that cyberspace potentially constitutes an external memory. The contemporary status of the cultural memory is elaborated, and a discussion is given to emphasize the importance of the sustainability of the cultural memory and collective identity.

The research of the cultural memory and the identification of mechanisms of the influence on it becomes the matter of the state importance for many countries. In our modern century of high technologies many politicians, scientists, actors involve the most powerful instrument of influence – the Internet resources.

Keywords: Cyberspace, cultural memory, the Virtual World

Introduction

The transformation processes of the maintenance of the cultural memory in the cyberspace act as the dominating way of the formation of the cultural identity. The time of the common memory and, respectively, undifferentiated identity has lost its positions. In modern society there is a gap in understanding, estimating and interpretations not only the remote past, but also the actual present. For the maintenance of a steady condition of society the events of cultural memory have to be built and interpreted so that members of a social group felt participation in the past as to the vital space.

The modern Internet society allows joining into the processes of collective identity formation to almost unlimited number of subjects. Thereby it promotes the formation of its active participation and partnership in processes of understanding of the valuable and semantic world of the cultural memory (Loiko & Dementieva 2014). The cyberspace is available to all people, that is why it is capable to make popular and/or unpopular some social contexts in which the phenomenon did a way from drowsiness to life and an event.

Analyzing the current situation, it is possible to draw an idea about the impossibility to be fenced off from so-called “virtual world”, “cyberspace” or so. It is necessary to analyze advantages and shortcomings, as well as to reveal the potential of the Internet technologies for the further development of the country, for the preservation of cultural identity of the society.

The phenomena of the Cyberspace and Virtual world

The Internet forms a new community, which unites people of different nationalities, beliefs, cultures and the social status. The society for which there are no frontiers. It gives the opportunity to hold global referenda on actual problems of the mankind which will allow to hear the opinion of the certain person where it wouldn't be and to provide feedback. The Internet gives us a new way of a social vision, transition to new ways of the interaction and development of progressive achievements of all mankind. For the intellectual life of mankind it has not smaller value than opening a publishing introduction hundreds years ago. Most likely the mankind didn't realize the information power and opportunities of the Internet yet.

The term cyberspace is non-uniform and has some levels. D. Clark offered a model in which there are four levels of a cyberspace (Clark 2010). The physical level contains all hardware devices that include routers, switches, carriers and satellites, sensors and other technical connectors, both wire, and wireless. The logical level in general belongs to a code, which includes both the software, and protocols, which are included in it. The level of content describes information all created, taken, stored and processed in a cyberspace. The social level consists of all people who are using and building up the phenomenon of a cyberspace. It is the actual Internet of people and the potential relations, but not the implied Internet of hardware and the software. In fact, the social group includes the governments, the private sector, civil society and subjects of technical community.

The opinions expressed on the Internet become available and achievable for perception by other persons. The Internet creates local communities of people as alternative to “grey rubble” or a standard layer (Sak 2013).

The term cyberspace had no differences with the term “virtual reality”. J. Lanier who coined the term “virtual reality” considered it like a “new reality” but without confines. J. Lanier considers being the father of virtual reality believed technology promised infinite possibilities. He explained that each of humans has an astonishing liquid infinity of imagination on the inside; that butts up against the stark reality of the physical world. That the baby’s imagination cannot be realized is a fundamental indignity that we only learn to live with when we decide to call ourselves adults. With virtual reality, you have a world with many of the qualities of the physical world, but it does not resist us. It releases us from the taboo against infinite possibilities. That is the reason virtual reality electrifies people so much (Novak 2011). Then architect M. Benedict considers that the cyberspace is the realization of our ancient dreams of overcoming the ‘impediments of the matter’. He assured that “the design of cyberspace is after all a design of another life-world, a parallel universe, offering the intoxicating prospects of actually fulfilling – with a technology very nearly achieved – a dream thousands of years old: the dream of transcending the physical world” (Benedict 1991, p.131). Then M. Novak (1991) shares his idea about cybernetic understanding of information as a pure pattern: “A liquid architecture in cyberspace is completely dematerialized architecture” (Novak 1991, p.251). These studies were the beginning of serious study of cyberspace.

Cyberspace challenges the cultural memory

The emergence of a wide variety of machines, trains and media like a radio, phones, afterwards the Internet marked the start of the fundamentally new time – electrification era of the city. This phenomenon marked the beginning of the obvious parallel shift in the social relationships of space and time, on which the Newton’s world was based. It is a long time since inhabitants perceived the city and urban space as motionless and static substance. Nowadays individuals are immersed in the electric light; they cannot imagine themselves in the center of this system even from a subjective point of view. The modern city is a media-architectural complex, so the spatial order has lost its undeniable power.

Nowadays there is a phenomenon called cyberspace, which is able to keep and save cultural memory as architecture. Cyberpunk science fiction writer W. Gibson first introduced the term in the 1980s. In academic circles the term "Cyberspace" started to become a synonym for the Internet and during the 1990s the World Wide Web. W. Gibson (1996) marked later: “All I knew about the word cyberspace when I coined it was that it seemed to be an effective buzzword. It seemed evocative and essentially meaningless. It was suggestive of something, but had no real semantic meaning, even for me, as I saw it emerge on the page” (Gibson W., quoted in R. Vamosi, 2015).

G. M. Ageeva considers the influence of social networks on the cultural memory in the thesis "Mediatization of memory: memoirs certificates in blogs and social networks". She investigates the representation features of memory images in the media sphere, as well as virtualization of the social mechanism of storing/oblivion, analyzes forms of accumulation and broadcast of the past during a digital era. Investigating the most popular network memorial projects, G. M. Ageeva pays the main attention to the content of entries in blogs and social networks (Ageeva 2012). It is worth to consider that information published in blogs and social networks is formed by the ordinary people and is controlled by nobody. It is only possible to assume, what consequences wait for us in the future when the contents of modern blogs are investigated by scientists of the future generations as we investigate rock paintings nowadays. It is a real challenge for the cultural memory. Our generation should try to be wise and fair to leave the qualitative information.

The interrelation of memory and media can be tracked in the book "Silence, the screen and a performance: Reconsideration of cultural memory during an era of information and new media" which represents the collection of articles of different modern scientists on this subject (Freeman 2014). His originators – L. Freeman, B. Nyenas and R. Daniel – note that "new technologies of mass communications and social media changed the character of our involvement into the present and the past, there were new calls for ethics of memory". According to A. Vasil’ev, authors of the collection managed to give a number of fine examples of research "ways by which the past is told, presented, taken out on the screen, it is placed on Facebook and it is presented in the Twitter, and also it is reflective and it is considered in new contexts" (Vasil’ev 2014).

S. Mcquire (Mcquire 2005) titled one chapter of his book “The Media City: Media, Architecture and Urban Space” as “Immaterial architecture”. He considers the cyberspace from the position of the urban space and architecture. Thus, nowadays architecture has not ceased to be an enormous system of the city and the custodian of individual memory and cultural memory as well. However, at the same time the phenomenon called cyberspace builds up another kind of architecture, immaterial one. This phenomenon marked the beginning of the obvious parallel shift in the social relationships of urban space and time. Both the interpretation of the term and the place of this phenomenon in real life make many contradictions about the meaning of the cyberspace.

S. Sak completely enough and with deep arguments explores cyberspace in her dissertation “Cyberspace as a locus for urban cultural and collective memory” (2013). Her investigation shed the light on links between cyberspace and memory. The apparent advantage of this research is the analysis of cultural memory within the context of cyberspace. S. Sak notes that “cyberspace is more than a storage space of those figures of memory and individual memories. In addition, the data that this memory holds is broadcasted and is accordingly accessible. Cyberspace enables collection, copying and consumption of this data independently of the physical and chronic limitations, and opens the way for global sharing” (Sak 2013, p. 69). The author substantiates the idea that the urban environment of the modern city can become a place of recreating a sort of "locuses" of cultural memories. Memory space is constructed by pre-designed aesthetic canons. Primarily the design of this construction must correspond positive memories of a man. Building cyberspace of the cultural memory and placing it on the Internet, make it more accessible to the majority of users. Further, S. Sak notes that cyberspace as cultural and collective memory should be

regarded from two positions: internal and external. In her investigation clearly defined that “cultural memory is internal to groups of people which the memory is of. That is to say, cultural memory is the image of past in the totality of collective thought and behavior. Cyberspace is external to the same groups of people, as a notepad that helps remembering is external to human mind” (Sak 2013, p. 70).

W. Gibson (Gibson W. quoted in Vamosi, R. 2015) connected the term “cyberspace” with the existence of the individual in completely new conditions of computerization. New conditions are all IT-industry products, which build up state unlike anything we had known before. Thus, this aggregate of phenomena gave a rise to conditions of the interpersonal interaction. Every era has its own revolution: the industrial revolution, the scientific-technical revolution and etc. Then, our generation has experienced a digital revolution. As a result, we are in the New Media Age consequently faced “cyberspace”. A consensual hallucination experienced daily by billions of legitimate operators, in every nation, by children being taught mathematical concepts... A graphic representation of data abstracted from banks of every computer in the human system. Lines of light ranged in the non-space of the mind, clusters and constellations of data.” (Gibson W. quoted in Vamosi, R. 2015). Cyberspace, due to its emergence, marked a new era of computerization and created new space for human existence. Nowadays, even the streets as a common space for communication have lost their function. The cyberspace and IT technologies, in which a person is completely immersed and located, replaced public places. Perhaps, cyberspace is a phenomenon that will allow us to get rid of our "mortal body" and immerse into the surreal world, which exists, but in the abstract, like a hallucination. But is it the vocation of cyberspace? This phenomenon was not invented artificial and it is not an integral datum of the human being at all times. Thus, we should figure out how to understand and use intelligently this phenomenon, so that it has brought benefits in our lives, not chaos and demoralization of mankind. W. Gibson’s book “The Neuromancer” (1984) made a splash in understanding cyberspace. He convicts this phenomenon in the form of a night city. Cyberspace owes much its existence to experience of the visual perception of the night city. The electric light helped to turn modern city in the bait, which attracts hundreds of thousands of people. The massive electric illumination became the means by which the whole map of the city at night can be reduced to a few large centers, flooded with spotlights, and other objects are simply erased. This is a simplified scheme.

The analysis of the Russian-speaking sites (it was investigated more than 50 sites) directed on preservation of cultural memory showed the following. Today the whole departments deal with a problem of cultural memory, so the Ministry of Defense contains references to four own virtual products devoted to military achievements of the Russian army and works with the grants actively. The key project of 2014-2015 is, certainly, the Great Patriotic War. Practically all similar sites have a forum where it is possible to lay out the information. The museums and libraries create the archival sites. The Ministry of Culture, also as well as the Ministry of Education and Science give out different grants under these purposes.

However, this variety of the presented material has a reverse side. It is impossible to forget that today any person can make the contribution to preservation of the cultural memory by means of the Internet. One has the right to create his/her own site or to work through the popular social networks. The result of similar activity is a huge number unchecked (perhaps, doubtful) information, on the one hand, and a network contamination small household information through social networks and often the illiterate speech of the author, on the other hand.

Thus, it is necessary to look for the balance between the official and personal information. The aim for the government of any country is to build an effective program of the preserving the cultural memory in the cyberspace.

Conclusion

In summing up the place and the role of the cultural memory in contemporary cyberspace we conclude: the importance of the cyberspace in the transmission of values and meanings of the world of the cultural memory increases. The content of the cultural memory is moved to the Internet and, so it provokes arising problems of "filling" the Internet with accurate and reliable information about the realities of social life and society. With the emergence of the phenomenon of cyberspace, we can say that a man more and more rarely communicates with other individuals in the real life, now all social interactions have moved into the area of the IT-technologies. Cyberspace, not public places, which is the area of social interaction nowadays. Today, the researchers of cultural memory raise the question how to present the content of the cultural memory in conditions of cyberspace.

An analysis of studies on the problems of cyberspace allows putting forward the hypothesis: the study of this phenomenon should specify and clarify its use for the humanities in the nearest future.

Abstract

The existence of the communication gap between society and authorities calls for the need for specific scientific analysis of information processes occurring through the Internet communications, since the latter have a significant influence on the structuring of civil society and its active position in the areas important for Russia.
The research identified the following problems of communication: absence of trust among citizens to the authorities and managers, lack of necessary information for citizens on the official websites of authorities, technological unpreparedness of the areas – the official websites of authorities, lack of competence of civil servants of government agencies providing communication, formal approach to responding to the complaints of citizens, non-public communication of civil servants and citizens, underdevelopment of activities of public organizations and distrust to them in society, low level of legal awareness and digital literacy of on the whole.
The conditions for the further development of models of communication between the authority and society:
• the presence of two-way communications
• the presence of common semantic information space
• competitiveness of opinions and ideas
• vision of general common future
• generation of consolidated action
• provision of the possibility of public expertise (including independent anti-corruption, gender, ecological expertise, etc.)
• providing regulatory documents to citizens, non-profit organizations and public associations.

Keywords: Internet communications, network society, dialog model of communication

Introduction

The Internet has become not just a new type of communication for society, it is obvious that communications in virtual reality have tendency to objectification. Real life evolves in the virtual space.

Literature Review

New opportunities for communication, business and creativity provided by the Internet were understood and described by Howard Rheingold in his book Smart Mobs: The next social revolution [2002]. He predicted that development of network communications would change public habits. Putting together all the components: technical, economic and social ones – we get an infrastructure allowing human actions which were impossible before. Smart mob is becoming an important actor of social processes, which consists of people who are able to act in concert not knowing each other. Modern technologies are becoming an absolutely new information environment which will be used by the government and corporations to control our habits and creeds on a scale larger than it was possible before the advent of the Internet. However, citizens will also find new opportunities to unite and resist to government institutions.

The question is how everything will go and if these technologies will be used as an instrument of social control or protest?

The theorist of the Network Society emphasizes [Castells, 2000] that spread of the networked organization of social community changes production techniques, the character of power relations, features of the transfer of social and cultural experience. This is a network of hosts of a new type, decentralized and connected by horizontal links, built on a voluntary basis, able to expand indefinitely by the inclusion of more and more cells. It is worth mentioning that the form of this new system is not a pyramid, but a rhizome. The decentralized nature of links in the network generates a non-linear response to an external stimulus. In his work Network Theory of Power [Castells, 2011], the author analyzes how social network can generate new forms of power, which is relevant to social communications:

1. Networking Power: the power of the actors and organizations included in the networks that constitute the core of the global network society over human collectives and individuals who are not included in these global networks.

2. Network Power: the power resulting from the standards required to coordinate social interaction in the networks. In this case, power is exercised not by exclusion from the networks but by the imposition of the rules of inclusion.

3. Networked Power: the power of social actors over other social actors in the network. The forms and processes of networked power are specific to each network.

4. Network-making Power: the power to program specific networks according to the interests and values of the programmers, and the power to switch different networks following the strategic alliances between the dominant actors of various networks.

Analysis & Findings

Against the theoretical study of the problems of the network society and its influence on changing the way of social system organization, solution of some applied problems becomes of current relevance. In particular, the prospects which new network technologies provide for the development of communication of all the forms and levels of the organization of power and community. We will try to tackle this problem in the article.

Reynolds shows that new technologies and network communication can be used to involve the society in decision making initiated by the authorities and to organize a protest against these decisions and the authorities themselves.

What should be done to make these communications evolve in a positive way?

Firstly, what is the potential for development of a constructive dialogue? What are the prospects opening up in case of its implementation?

- People are involved in the search for most optimal solutions of the problems which exist in society; coordination of opinions on most important positions is performed
- The gap of communication between society and government is reduced; the government becomes more open
- The level of protest moods in society decreases
-

All of these points can help to consolidate positive forces of society for the development of the country through the Internet-interaction of government and society, which should be more open, public and constructive.

What can hinder the development of a constructive dialogue? According to the research, citizens [Vasilenko, 2014: 18] mention obstacles such as formal replies from the authorities to the citizens (56.4%), lack of or inefficient feedback function on specialized websites (43.6%), non-public communication of public servants and citizens (requests and answers are not published on the website) (38.5 %), lack of opportunity to continue the dialog after getting an answer (35.9 %).

Civil servants attribute these problems to technical and technological reasons which reinforce citizen complaints of the formalism of their activities.

In addition to the indicated reasons, it is necessary to note "digital disparity" among citizens and regions and low awareness of Internet projects such as "Russian public initiative", where people can put forward their ideas or just vote for other initiatives registered there. If an initiative reaches 100000 votes, it will be considered by experts for its presentation at a state government meeting. There is also a project "Open government", where everyone can get access to documents and activities of the government to exercise efficient social control. Disuse of communication opportunities provided by the Internet is caused by ill-preparedness of both sides – government and society. It is also connected with distrust of citizens to government authorities and to their managers or often the lack of necessary information for citizens. It is also caused by technological disadvantages of the areas, i.e. lack of official sites of government authorities, weak competence of government employees responsible for communication.

As a result, the probability for public intelligence to affect government decisions is very low. For these reasons, experts from both sides, civil servants and common people, assess the dialog between them as unsatisfactory. It means there are no citizens who are fully satisfied with the dialog with government. According to the statistics, on the regional level, 15.4% of civil servants and citizens answered "almost satisfied", however, on the state level, this number was even lower, only 10.3% [Vasilenko, 2014: 19].

Not only common people but non-profit and social organizations as well do not use all the opportunities of social control. The authors of "Dialog between government and society through the Internet-communications" note that social organizations acting as intermediaries are not ready to actively defend the interests of society. Those organizations working in close contact with government authorities often heavily depend on them. This tendency emerged during the creation of such institute of civil society as public chambers. It was created for organization and support of interaction among government authorities, public and social associations and local government to defend interest of Russian Federation citizens. However, the procedure of voting for social chamber members was discredited in Internet-communications. A social chamber in essence is only a deliberative institute of civil society.

The capabilities of the government-society communication model at the present time are limited. The conditions to be developed to carry out a constructive dialogue are as follows:

- the presence of two-way communications
- the presence of common semantic information space
- competitiveness of opinions and ideas
- vision of general common future
- generation of consolidated action
- provision of the possibility of public expertise (including independent anti-corruption, gender, ecological ones, etc.)
- providing regulatory documents for citizens, non-profit organizations and public associations.

Conclusion

According to the results of the public opinion survey, the principle of compulsory meaningful response from representatives of authorities becomes especially significant; otherwise it will cause immediate and widely replicated comments about incompetence of a manager or responsible officer, which will be

redirected to the state authority. Traditional closeness of Russian authorities is not the only obstacle to a constructive dialogue. Current socio-economic problems cause citizens to be concerned with finding means of subsistence for themselves and their families, additional earnings rather than improving the system of management at the local level and in the centre. Lack of legal awareness and civic responsibility should be also taken into account. A certain part of the population is not used to trusting the authorities; they do not believe in the efficacy of laws, and furthermore, they continue to believe that these institutions are created primarily to lobby for the interests of those who come to power, or are close to it, but not ordinary citizens.

Insufficient information on the activities of such organizations or even suspicious attitude to them leads to necessity of development of interaction between government and society through these organizations, as well as application of most actual and efficient models of the "government-society" dialog in social practice.

These tendencies will inevitably be implemented as a new generation of people reaches its active age, because their socialization takes place in the digital era. A new generation of people were born at the time when the Internet became an integral part of life, they communicate via mobile phones, YouTube, Facebook, etc. It is not hierarchical but network structure of their social communication implemented through social networks that requires similar models of interaction with them, management technologies and their involvement into the state and civil life.

Abstract

Small Medium Enterprises (SMEs) particularly those from emerging countries presence significant roles to the economic development. Despite of their constraints, SMEs are struggling to expand into the international market and compete internationally. This study aims to explore the SMEs from emerging countries by examining the ecosystem of the SMEs in Malaysia. Based on qualitative methods specifically personal interviews using open ended questionnaire involving 35 SMEs' owners, the study discovered that the development of entrepreneurial ecosystem of Malaysia required all the six elements; finance, market, human capital, business culture, business support and policy. Nevertheless, the importance of the six components slightly differ from Iceberg Model (2010). Although the Iceberg model stated policy as the first or the most important component of the entrepreneurial ecosystem, in Malaysia the SMEs have emphasized more on the importance of finance and market. . As the majority of Malaysian SMEs are still smaller and operate locally, they need more market and financial resource to expend their business globally. This study provide basic information for future research of the entrepreneurial ecosystem development for the enhancement of SMEs Masterplan 2012-2020.

Keywords: Entrepreneurial Ecosystem, Entrepreneurship, Small Medium Industry, Malaysia

Introduction

Today's firms especially the Small Medium Industries (SMEs) are very much exposed to market pressure. SMEs are also often constrained by many problems such as the lack of human capital (skilled workers and technical know-how), little or no innovations though research and development (R&D), limited economies of scale, and difficulty in getting rid of traditional operation methods (Chin, 2004). In addition, SME's often have others weaknesses including the limited utilization of technology, limited involvement in R&D activities, the lack of technical professional and management expertise and entrepreneurial skills, and the inability to explore market opportunity (Haq, Ha & Said, 2009).

Similarly, in Malaysia, some of the existing literatures highlighted many challenges facing the SMEs, such as the lack of financing, low productivity, lack of managerial capabilities, lack of access to management and technology as well as the heavy regulatory burden (SME Corp, 2012; Saleh & Ndubisi 2006). The major obstacles to entrepreneurship development are lack of access to credit, lack of access to formal business and social networks (Teoh & Chong, 2008). The SMEs in Malaysia also lack of knowledge regarding marketing techniques, branding, customer loyalty, as well as lack of good contacts with others local and international enterprises (Hashim 2012). Therefore, SMEs are frequently at a disadvantage relative to their larger counterparts regarding their abilities to attract, retain, and motivate the best human resources (Beaver & Hutchings, 2005).

Despite extensive studies on SMEs, it has been found that the study that focus on overall components of entrepreneurial ecosystem of the SMEs rather limited. Hence, lack of model or framework that provides the overall entrepreneurial ecosystem of Malaysian SMEs. An analysis of entrepreneurial ecosystem among the Malaysian SMEs is vital to develop a foundation for collective strategies, innovation and value changer mechanism for national SMEs knowledge-based competitive guidelines (Yusoff, Ghafar & Shafie, 2015). Therefore, this paper provide preliminary finding on the entrepreneurial ecosystem of Malaysia SMEs.

Entrepreneurial Ecosystem

What is Entrepreneurial Ecosystem?

The term 'entrepreneurial ecosystem' was used by other researchers such as More (1996), Prahalad (2005), and Bernardez (2009) to describe conditions in which the individual, enterprise and society come together to foster the generation of economic wealth and prosperity. Moore (1996) specifically, defined entrepreneurial or business ecosystem as "an economic community supported by a foundation of interacting organizations and individuals which is the organisms of the business world." (Moore, 1996, 9). This includes customers, lead producers, competitors, and other stakeholders. The concept of an 'entrepreneurial ecosystem' was brought into prominence in 2010 by Professor Daniel Isenberg from Babson College through an article in the Harvard Business Review (Isenberg 2010). The impact of entrepreneurship ecosystem to entrepreneurial performance is the value created by entrepreneurs, and entrepreneurship, which normally refers to macroeconomic variables to identify the impact on business performance such as GDP growth, employment, to measure income distributions, or the size of the formal sector and the informal sector (Theodotou, 2012). As a conclusion entrepreneurial ecosystem is a nature of organization in one business system containing of customers, lead producers, competitors, and other stakeholders can provides a powerful analogy for understanding build up a business network.

Components of Entrepreneurial Ecosystem

Iseberg (2010) has introduced six key components of entrepreneurial ecosystem which are policy, finance, culture, support, human capital and markets. All six domains of entrepreneurship ecosystem have their role respectively, critical and must grow concurrently and in parallel. For example, (1) Culture, supportive to entrepreneurs and accepting of failure, (2) Customers and market, (3) Entrepreneurs and entrepreneurs' start-ups, (4) Financing: angel investors, venture capitalists and private equity firms, (5) Legal and regulatory framework, (6) Liaisons, (7) Media (social media, publications, newspapers, magazines, blogs, TV, radio, etc.), (8) Private sector and professional services providers such as accountants and auditors, lawyers and fiduciary services amongst others, (9) Universities and Research & Development (R&D) Centers and (10) Voice of the industry which includes associations such as the Chamber of Commerce, business associations, non-governmental organizations, informal entrepreneur groups, incubators, accelerators, etc. (Mazzarol, 2014). The interconnectivity of entrepreneurial ecosystem component is presented in Figure 1.

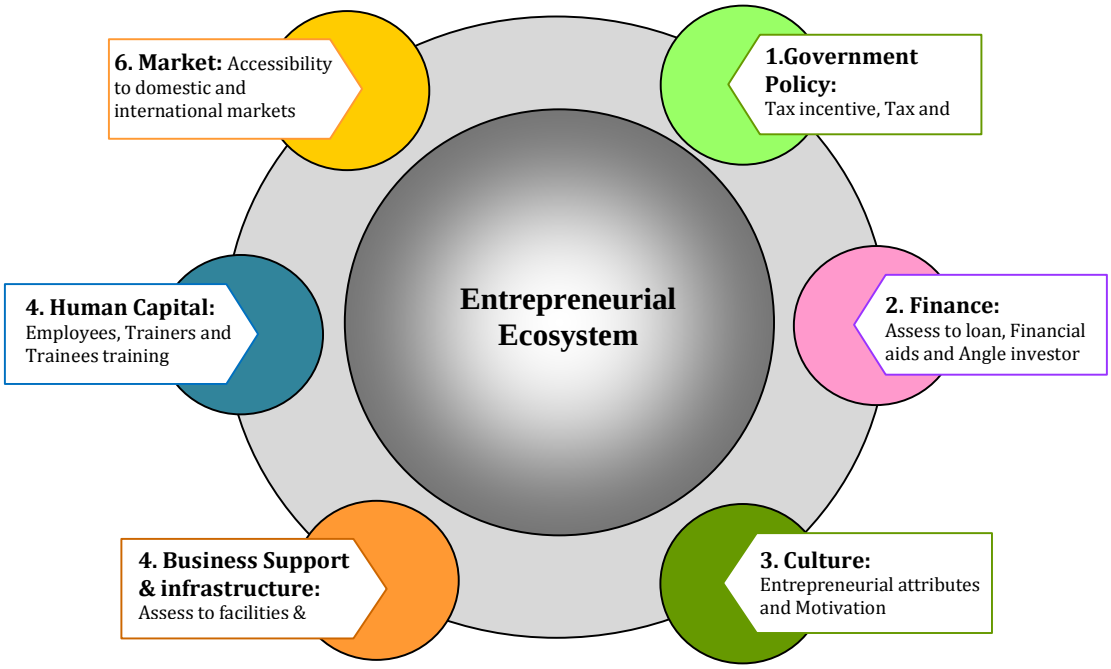

Figure 1: Entrepreneurial Ecosystem Measurement
Adapted from Isberg (2010)

Each of the components is briefly explain as follows:

(1) Government policy: Government policy is the first and perhaps most important component of an entrepreneurial ecosystem. The policy include laws and regulations friendly and supportive to entrepreneurs, which protect intellectual property, facilitate access to capital and human capital Development (Robles,2014). Mason and Brown (2014) suggested that government policy relating to the development of entrepreneurial ecosystems should be developed based on seven general principles as (1) Cannot create something from nothing; (2) Policy approaches need to evolve over time; (3) No one size fits all; (4) Each component is of equal importance and if any component is missing the system will fail or fail to grow; (5) require a 'top down' and 'bottom up' approach; (6) Distinguish between small business and entrepreneurship policies; and (7) should reflect the diversity of such firms. As a conclusion the government policy has to be developed as holistic as possible, with attention given to both macro and micro-level policy settings so as to facilitate the entrepreneurial ecosystem via a simultaneous 'top-down' and 'bottom-up' approach.

***(2) Finance*- Source** of funding is one of the most importance component in every business because there is none of one business can start without any funding. An inclusive financing ecosystem is a significant element in this composite development which is including the establishment of effective institutional arrangements for financing and development through the establishment of specific schemes and providing avenues for information, advice and redress as well as debt resolution and management, and outreach programs. (Cyproman & KPMG, 2012).

(3) Culture - A culture that fosters entrepreneurship is characterized by innovative and disruptive ideas, accepts failure and encourages calculated risk taking, sees entrepreneurs favorably, gives failed entrepreneurs a second chance and encourages the feasibility of their aspirations (Klamer, 2006).

(4) ***Business Support*** **-** those services that aim to assist enterprises or entrepreneurs to successfully develop their business activity and to respond effectively to the challenges of their business, social and physical environment (Mathibe, 2010). In Malaysia the infrastructure plays a key role in promoting and sustaining rapid economic growth (Nath & Bhattacharyay, 2010). The support of infrastructure includes telecommunication, transportation, logistics and energy. Of equal importance is the availability of business mentoring, advisory and support services, the engagement in the system by universities and the provision of education and training for entrepreneurs and employees (Mazzarol, 2014).

(5) Human Capital **-** refers to the labor, employees or manpower (Thaib, 2013). The important and significant of human capital development in the achievement of development sustainable business growth have been extensively acknowledged in many studies. For example, Eigbiremolen and Anaduaka (2014) and Erluwua (2007) revealed that human capital found to be influence business development and economic growth of the country.

(6) Market **-** The growth and start-ups within an entrepreneurship ecosystem need an access to customers and markets. Influential marketing function appears to make no tangible difference performance-wise in entrepreneurial firms and their findings were perhaps consistent with marketing influence business performance (Merlo & Bell, 2007) For example, the value of the marketing function within the firm as the degree to which it is perceived to contribute to the success of the firm (Christine & Rust, 1999). Nowadays, with the power of the internet, accessing customers and markets is targeted, specific and instantaneous (World Economic Forum, 2013).

Methodology

This study employed a qualitative method since this method found to be the most suitable method to captured new issue that has not yet explored. The purposive sampling involving 35 owners of Malaysian SMEs of the two states in Malaysia (Johor and Selangor). Both have been chosen as samples of the study since they have the highest number of SMEs in Malaysia (SME Corp, 2014).

Personal interviews using semi-structured questionnaire had been chosen as a primary data collection technique. The respondents were asked three important questions; (1) What are the component of entrepreneurial ecosystem that is important to their business; (2) Why do the entrepreneurial ecosystem important?; and (3) How to develop effective entrepreneurial ecosystem. Based on Iceberg (2010) Business ecosystem framework, the data gathered from the interviews were organized and analysed using thematic analysis methods.

Findings

Entrepreneurial Ecosystem that perceived to be important for SMEs

The entrepreneurship ecosystem model (Isenberg, 2010) has introduced six components; policy, finance, culture, support, human capital and market. In this study, the SMEs were asked the components of entrepreneurial ecosystem that they think is important to their business. Based on interviews, of the six components, all SMEs (35 respondents) in the opinioned that market and finance are the two most important components that effect their businesses. The next component are; support (, human capital policy and culture (see Figure 2).

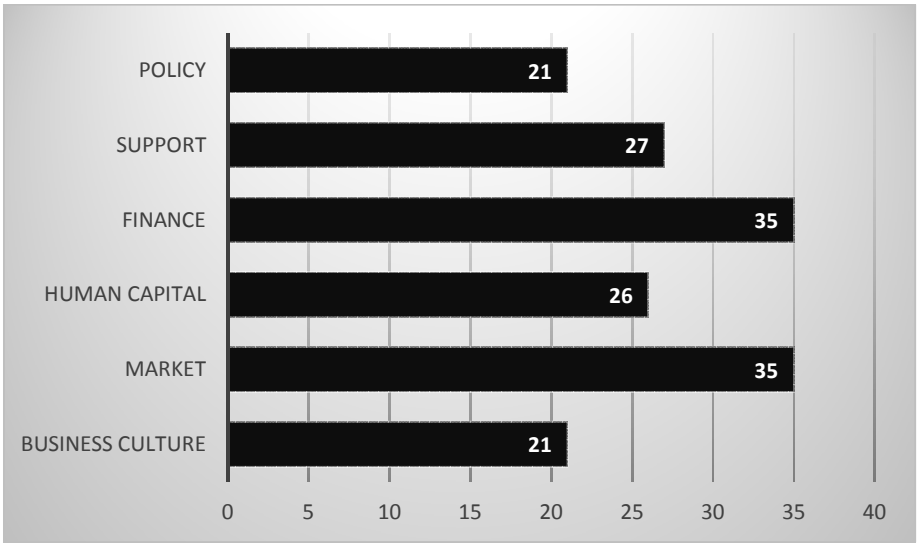

Figure 2: A summary of component of entrepreneurial ecosystem

Some of the statements mentioned by the respondents:-

"If I were to choose, I would say three most important components for me are; finance, market and support" (Owner of SMEs in Johor)

"All SMEs in Malaysia, especially in the early stage, need all components. But what important for them are; financial, support from agencies and market" (Owner of SMEs in Johor)

I have been in this business for almost 10 years. What I can say without strong financial and market we can't survive especially in the global economy" (Owner of SMEs in Selangor)

"We do need good government policy and support but more importantly we need money to run our business" (Owner of SMEs in Selangor)

Why do the entrepreneurial ecosystem important to the SMEs?

It has been acknowledged that entrepreneurial ecosystem is important to sustain any business particularly to compete in the global economy. The impact normally can be seen in term of business performance, GDP growth and employment (Theodotou,2012). The respondents of the study found to have in the same opinions that the entrepreneurial ecosystem is important for the SMEs for four main reasons; to expand and sustain their business; to go for global market; to generate more revenue; to establish more business network (see Figure 3). The findings similar to previous literature which shows that the ecosystem is important for business performance which finally contribute to the economic growth of the country.

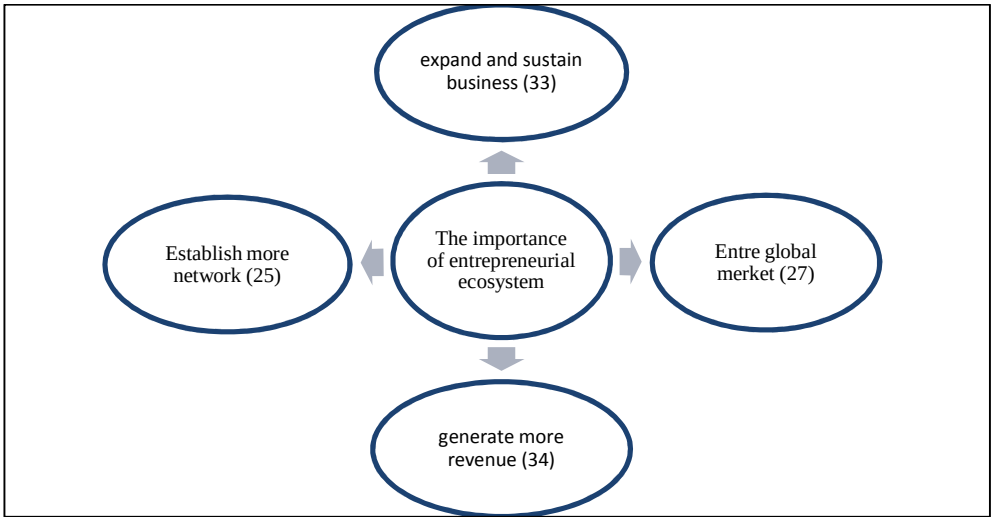

Figure 3: A summary on the importance of entrepreneurial ecosystem

For example two respondents said:

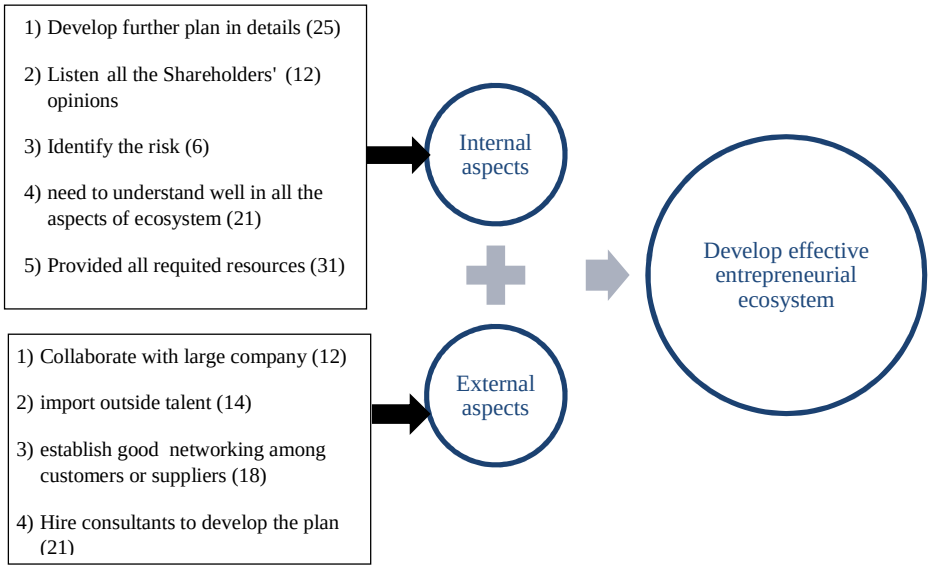
"My business need all components especially financial and market, so that I can expand my business in other country, and in a long term sustain it"

"Nowadays we get all supports from the government. But why many SMEs failed? I believed because we are still having many problems especially market and business network. So, market and business network to me is really important not only to get more revenues, both can sustain my business.

How to develop effective entrepreneurial ecosystem?

In relation to develop good entrepreneurial ecosystem, many of the SMEs in the study believed that the effort should be a combination of both internal and external aspects as illustrated in Figure 4. However, the emphasis has been given more on the internal aspects. In term of internal aspects, majority of the companies stated that they need to allocate all required resources, develop detail plan, as well as should understand the meaning of ecosystem, listened to shareholders opinions and identify risks.

At the same time they also need support from external aspects especially they have to hire external consultants to develop the plan and establish good networking with customers and supplies, important outside talents and collaborate with large companies. The results imply that the to develop effective entrepreneurial ecosystem Malaysian SMEs need supports from both internal and external aspects of the business



Conclusion

As a conclusion entrepreneurship is about a value added aspiration, and when successful, distinctively improves the overall economy of nations. Hence, developing Malaysian entrepreneurship ecosystems required intercalated input from various parties and resources. Particularly the SMEs in Malaysia required financial and marketing aspects In fact, entrepreneurial resourcefulness is not limited to edifice of tangible/physical companies but depends on capacity building in human capital. For instance, entrepreneurs intertwine exchange of ideas (networking), solve resource constraints (effective utilization of scares resources), and fill institutional gaps in the entrepreneurship reorientation. To get the appropriate entrepreneurial framework in place Malaysian SMEs need to invest both internal and external aspect particularly they have to have in-depth understanding on the concept of entrepreneurial ecosystem itself and synergies that boost entrepreneurship as a realistic paradigm rather than an idealistic trend. These collectively could provide the desirable and holistic reform and educate government policymakers about real entrepreneurial ecosystem require to enhance the actual SMEs development in Malaysia. Therefore, a comprehensive national entrepreneurial ecosystem needs to be constructed through rigorous and robust research process of this nature.

This study has provided basic information entrepreneurial ecosystem of Malaysians SMEs that can be used for any reforms to reduce the stumbling block to starting, operating and managing as well as growing borderless entrepreneurial exposure in Malaysia towards the enhancement of SMEs Masterplan 2012-2020.

Sustainable Development Challenges in Transportation in European Countries during the Economic Crisis

Georgiana Marin, Bucharest University of Economic Studies, Bucharest, Romania,
maringeorgiana57@yahoo.com

Abstract.

The climate debate and action often focuses on energy and industrial activity as the key sectors contributing to greenhouse gas emissions. However, transportation, with its fast increasing rate of harmful emissions, should also be included in any holistic policy addressing climate change and sustainable development. This paper aims to perform a critical analysis on this sector at European level within three critical economic periods: 2008, 2010 and 2012. A cluster analysis will be employed. The first objective of the paper is to analyze the comparative migration of countries within the resulted clusters. The second objective is to find justifications regarding the remain in a performant cluster or the migration in a less performant cluster of certain countries. Last, but not least, based on the experience of EU countries, to propose measures and best practices for Romania and simmilar countries, so that in the future to occupy a place in a more performant cluster and increase their chances to achieve the objectives for the 2020 horizon, imposed by the EU.

Keywords: sustainable development, transportation, sustainability

Introduction

"Sustainable development is recognized as an endeavor to harmonize the growth of urban territories with a social progress by reducing waste of non-renewable natural resources and negative impacts on ecological equilibrium. The cohesion of economic, social and ecologic aspects constitutes the foundation for developing a sustainable city. The quality of transport systems, specifically technical infrastructure and functionality, ensures the existence of economic and social spheres and is treated as being very important to sustainable urban development." (Griškevičiūtė-Gečienė & Burinskienė, 2012).

The European Council of Ministers of Transport (ECMT, 2004) describes sustainable transport as follows:

" - It allows the basic access and development needs of individuals, companies and society to be met safely and in a manner consistent with human and ecosystem health, and promotes equity within and between successive generations.

- It is affordable, operates fairly and efficiently, offers a choice of transport mode and supports a competitive economy, as well as balanced regional development.

- It limits emissions and waste within the planet's ability to absorb them, uses renewable resources at or below their rates of generation, and uses non-renewable resources at or below the rates of development of renewable substitutes, while minimizing the impact on the use of land and the generation of noise."

The impact of transport has crucial importance for sustainable development (Litman, 2008).

The EU developed a transportation-specific strategy, described in the European Transport Policy for 2010 (COM, 2001b). In this strategy, the priorities of the transport sector are laid out in four broad categories: 1) shifting the balance between modes of transport, 2) eliminating bottlenecks, 3) placing users at the heart of transport policy, and 4) managing the globalization of transport. (European Commission, 2001)

Moreover, according to the European Commission 2009 there are some FP7 and FP7 projects relevant to indicators for the EU Sustainable Development Strategy, which are considering sustainable transport objectives, such as: INDI-LINK, FORESCENE, TISSUE, HEATSCO, WET-H2, TRANSFORUM, TRANS-TOOLS, REFIT and ELME.

The complexity of the EU framework means faces significant challenges in coordinating the implementation of strategies in all member states. The EU has included many attributes for a robust framework in its strategies; however, it is important to link the objectives to actions that can be realistically implemented by member states. (European Commission, 2001).

Therefore, in the next chapter the author wants to conduct a Cluster Analysis in the EU countries, based on the indicators for sustainable development in freight transport, for critical economic periods. The aim of this research is firstly to analyze the comparative migration of countries within the resulted clusters, secondly to find justifications regarding the remain in a performant cluster or the migration in a less performant cluster of certain countries and last but not least, based on the experience of EU countries, to propose measures and best practices for Romania and simmilar countries, so that they will occupy a place in a more performant cluster and increase their chances to achieve the objectives for the 2020 horizon, imposed by the EU.

Methodology:

In order to perform the comparative analysis among the European countries, data for year 2008, 2010 and 2012 have been taken from Eurostat. The reason for choosing these years is the author's desire to carry out an analysis regarding the main indicators for sustainable development in freight transport at EU's level, for 2008, the year when the economic crisis began, year 2010, during the crisis and 2012, the first in which the majority of European countries have emerged from the crisis.

In order to analyze the transport sector among the European Union the author has chosen 12 variables as follows:

a) Energy consumption of transport relative to GDP;
b) Modal split of freight transport roads;
c) Modal split of freight transport railways;
d) Volume of freight transport relative to GDP;
e) Energy consumption of transport, rail;
f) Energy consumption of transport, road;
g) HICP - annual average indices for transport prices;
h) Greenhouse gas emissions from transport;
i) Emissions of nitrogen oxides (NOx) from transport non-road;
j) Emissions of nitrogen oxides (NOx) from transport road;
k) Emissions of particulate matter from transport non-road;
l) Emissions of particulate matter from transport road.

Firstly, in order to perform the Cluster Analysis, the countries that registered missing data regarding the indicators for the three years mentioned above have been removed, namely: Greece, Cyprus, Croatia, Malta, Islandm Norway and Spain. The 12 variables were selected based on their relevance for a sustainable development in the transportation sector and also on the correlations that can be done by comparing them. For example a high demand for freight transportation generates more energy consumption. Depending on which type of transport is being used, whether railway or road, the annual average indices for transport prices may fluctuate. Gas emission is also an indicator that shows the relationship between the economic and environmental sector of that particular country, in order to measure the consumption levels and at the same time forecast the production capacity that needs to be in line with the pollution reduction targets.

The hierarchical cluster algorithm was applied as follows:

The methods to determine the distance between the items was the Squared Euclidian Distance, as it is the most appropriate for the data set;

The author has chosen the Ward Hierarchical Clustering Method, because it does not need to predict the number of clusters;

As the variables are expressed in different unit measures, the author has chosen to standardize them using the Z Scores Method.

Research results

After performing the Cluster Analysis for 2008, one can observe that the countries taken into account are divided into four clusters according to the Dendogram (Figure 1):

- *The first cluster:* Belgium, Czech Republic, Denmark, Ireland, Luxembourg, Netherlands, Austria, Portugal, Slovakia, Finland, Sweden;
- *The second cluster:* Bulgaria, Lithuania, Hungary, Poland, Romania, Slovenia;
- *The third cluster:* Germany, Spain, France, Italy, United Kingdom;
- *The fourth cluster:* Estonia, Latvia.

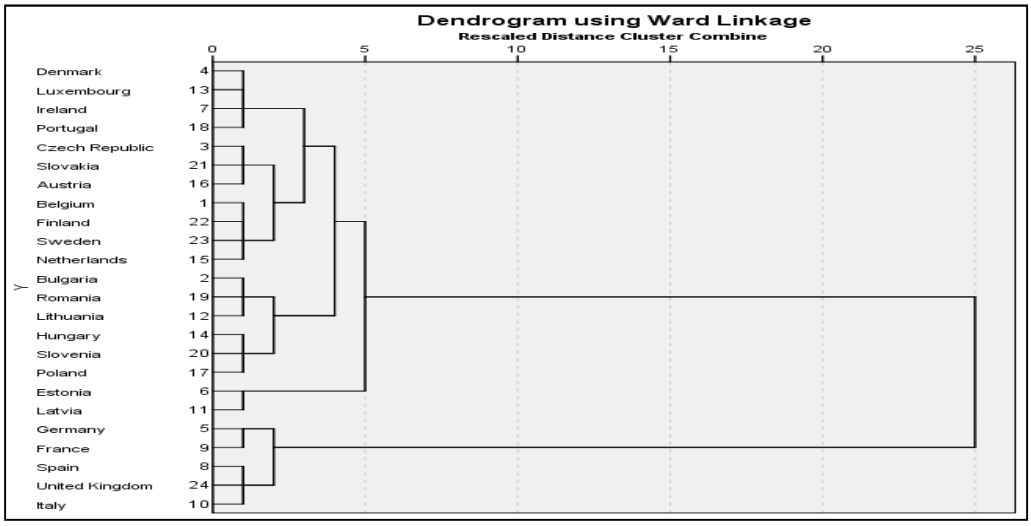

Figure 1: Dendogram for 2008, resulted from the Cluster Analysis

Source: developed by the author

The table containing descriptive statistics for each cluster is presented below:

Table 1: Mean by cluster for 2008, Source: designed by the author

Variable Name	Mean Cluster 1 (11 countries)	Mean Cluster 2 (6 countries)	Mean Cluster 3 (5 countries)	Mean Cluster 4 (2 countries)
Energy consumption of transport relative to GDP	100.5182	106.6667	89.3200	92.7000
Modal split of freight transport road	77.6727	71.3167	83.7000	47.0000

Modal split of freight transport railway	16.7727	23.9667	13.1400	53.0000
Volume of freight transport relative to GDP	90.5455	132.4500	97.8200	82.3000
Energy consumption of transport rail	125.1545	162.6833	951.3200	55.3500
Energy consumption of transport road	5864.7091	5046.8000	40356.4800	919.6000
HICP annual average indices for transport prices	108.3555	118.6150	108.2460	129.2600
Greenhouse gas emissions from transport	18.4145	15.5420	127.3262	2.9734
Emissions of nitrogen oxides NOx from transport non-road	12776.0909	7384.6667	87888.8000	3907.0000
Emissions of nitrogen oxides NOx from transport road	73550.9091	92334.8333	532427.0000	14148.5000
Emissions of particulate matter from transport non-road	573.0000	355.3333	4979.0000	131.5000
Emissions of particulate matter from transport road	4159.7273	6056.0000	27959.2000	708.0000

Regarding the volume of freight transport relatively to GDP, one can observe that the countries in the second cluster have registered a significant average growth in 2008, compared to 2000.

From the energy consumption of transport by rail point of view, one can observe that the lowest energy consumption is registered for countries from the fourth cluster, and the highest for the ones in the third cluster. Regarding the energy consumption of transport by road, one can observe that the lowest energy consumption is registered for countries in the fourth cluster, while the highest for the ones in the third cluster. However the countries in the third cluster have registered the lowest energy consumption relative to GDP. Regarding the energy consumption, countries from the first and second cluster are relatively closed.

Analyzing the HICP annual average on transport prices, one can observe that countries in the third cluster are the most competitive, registering the lowest value. Regarding the greenhouse gas emissions, the emissions of nitrogen oxides NOx and the emissions of particulate matter, countries in the third cluster register the highest values. This analysis indicates that Estonia and Latvia represent two atypical cases regarding transportation, because their pollution level is the lowest compared to the countries in the other clusters.

Next the Cluster Analysis for 2010 has been performed. One can observe that the countries taken into account are now divided into three clusters according to the Dendogram (Figure 2):

- *The first cluster:* Belgium, Czech Republic, Denmark, Ireland, Luxembourg, Netherlands, Austria, Poland, Portugal, Slovenia, Slovakia, Finland, Sweden;
- *The second cluster:* Bulgaria, Estonia, Latvia, Lithuania, Hungary, Romania;
- *The third cluster:* Germany, Spain, France, Italy, United Kingdom.

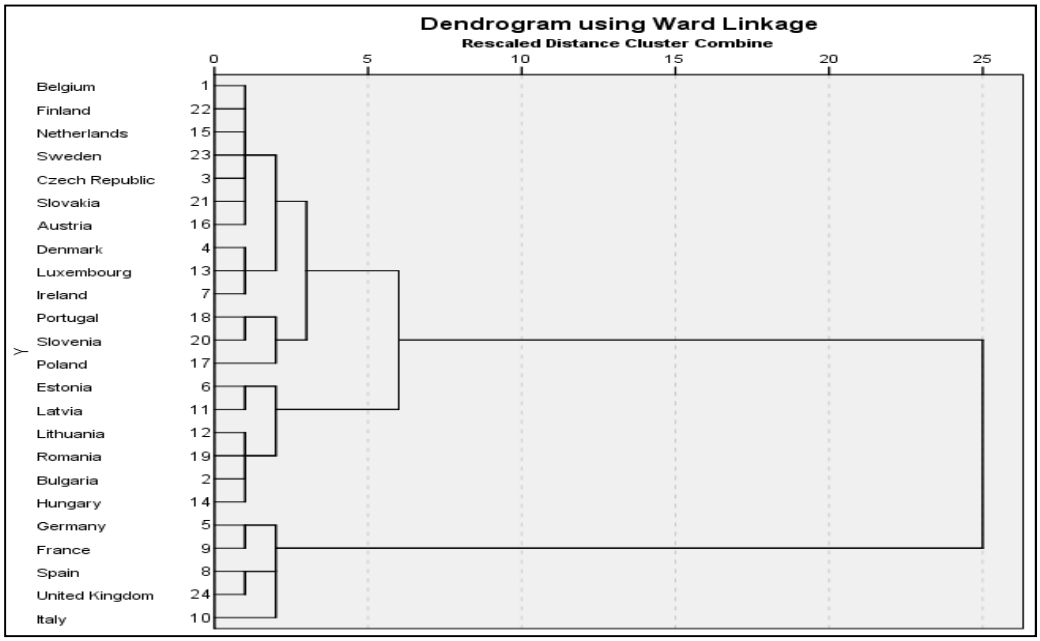

Figure 2: The dendogram for 2010, resulted from the Cluster Analysis, Source: designed by the

In 2010, as a result of the crisis deepening, the volume of the transported freight has reduced for the third cluster (in this cluster belong the same countries, which in 2008 were in the third cluster). In the first cluster belong now Slovenia, while Latvia and Estonia have formed a cluster together with Romania, Bulgaria, Hungary and Lithuania. The highest energy consumption, both rail and road transport has been registered for countries in the third cluster, but these countries have registered the lowest energy consumption relative to GDP.

Regarding prices, countries in the third cluster are the most competitive, registering the lowest HICP, which means that although they consume less, they still produce more. Analyzing the volumes of greenhouse gas emissions, emissions of nitrogen oxides NOx and the emissions of particulate matter, one can observe that the highest values are registered for countries in the third cluster and the lowest for the ones in the second cluster.

The table containing descriptive statistics for each cluster is presented below:

Table 1: Mean by cluster for 2010, Source: designed by the author

Variable Name	Mean Cluster 1 (13 countries)	Mean Cluster 2 (6 countries)	Mean Cluster 3 (5 countries)
Energy consumption of transport relative to GDP	101.6154	100.6667	87.9800
Modal split of freight transport road	77.5769	55.9000	84.4200
Modal split of freight transport railway	17.3538	35.1333	12.1200
Volume of freight transport relative to GDP	92.8154	115.9500	90.8600
Energy consumption of transport rail	134.6000	100.2833	930.7600
Energy consumption of transport road	6238.0846	2342.6000	39079.9400
HICP annual average indices for transport prices	111.1577	132.4850	111.0380
Greenhouse gas emissions from transport	19.1014	7.3107	123.1970

Emissions of nitrogen oxides NOx from transport non-road	11765.8462	5711.6667	82402.4000
Emissions of nitrogen oxides NOx from transport road	79836.0000	41856.5000	467089.4000
Emissions of particulate matter from transport non-road	548.5385	214.6667	4283.6000
Emissions of particulate matter from transport road	5078.6923	2177.0000	25463.6000

Finaly the Cluster Analysis for 2012 has been performed. One can observe that the countries taken into account are also divided into three clusters according to the Dendogram (Figure 3):

- *The first cluster:* Belgium, Czech Republic, Denmark, Ireland, Luxembourg, Netherlands, Austria, Portugal, Slovakia, Finland, Sweden;
- *The second cluster:* Bulgaria, Estonia, Latvia, Lithuania, Hungary, Poland, Romania, Slovenia;
- *The third cluster:* Germany, Spain, France, Italy, United Kingdom.

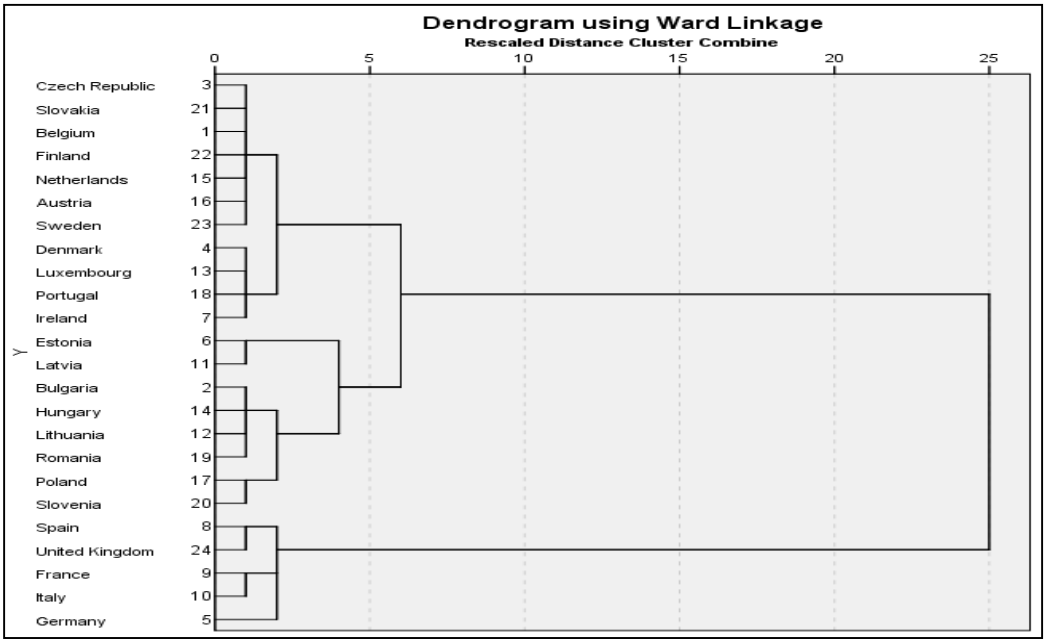

Figure 3: The dendogram for 2012, resulted from the Cluster Analysis, Source: designed by the

In 2012 the volume of transported freight has lowered in the third cluster (in this cluster belong the same countries, which in 2008 and 2010 were in the third cluster) and the first cluster and the second cluster has registered an increase in values. In the second cluster now belong Poland and Slovenia. The highest energy consumption, both on rail and road have registered countries in the third cluster, but these countries registered the lowest energy consumption relative to GDP. Regarding prices, after the crisis, the most competitive countries are now in the first cluster, and no longer in the third one, registering the lowest HICP. With regard to the volumes of greenhouse gas emissions, emissions of nitrogen oxides NOx and the emissions of particulate matter, the highest values are recorded for countries in the third cluster, and the lowest for the ones in second cluster, with the exception of emissions of particulate matter from road transport, where the lowest value is registered for the first cluster.

The table containing descriptive statistics for each cluster is presented below:

Table 3: Mean by cluster for 2012, Source: designed by the author

Variable Name	Mean Cluster 1 (11 countries)	Mean Cluster 2 (8 countries)	Mean Cluster 3 (5 countries)
Energy consumption of transport relative to GDP	92.2273	98.8375	84.2600
Modal split of freight transport road	76.1727	64.7750	82.9200
Modal split of freight transport railway	17.3818	29.8000	13.7400
Volume of freight transport relative to GDP	78.3364	127.4375	85.0000
Energy consumption of transport rail	123.2545	126.4000	913.3000
Energy consumption of transport road	5413.1364	4010.1375	37608.6600
HICP annual average indices for transport prices	116.5636	138.1138	117.3860
Greenhouse gas emissions from transport	16.6738	12.0678	117.7147
Emissions of nitrogen oxides NOx from transport non-road	11597.4545	5953.5000	75915.0000
Emissions of nitrogen oxides NOx from transport road	58382.0000	64765.5000	419073.8000
Emissions of particulate matter from transport non-road	509.3636	274.2500	3951.2000
Emissions of particulate matter from transport road	3282.2727	4291.6250	21485.4000

For a better interpretation of the results gathered from the Cluster Analysis, the author has also verified the means of transport used to carry the freight volumes in each country, for 2008, 2010 and 2012, see *Figure 4*, *Figure 5* and *Figure 6*. The source of these data was the Eurostat database. Due to the lack of data and the fact that some countries do not dispose of all four means of transport, for countries like Germany, Estonia, Ireland, Spain, Italy, Latvia, Lithuania, Portugal, Slovenia, Finland, Sweden and United Kingdom transport by inland waterways is not mentioned for 2008 and the same happens for Denmark in 2010. Lithuania registered missing data for road transport in all three years. The same happened with Czech Republic, Luxembourg, Hungary, Austria, Slovakia and for Portugal (only in 2012) for sea transport.

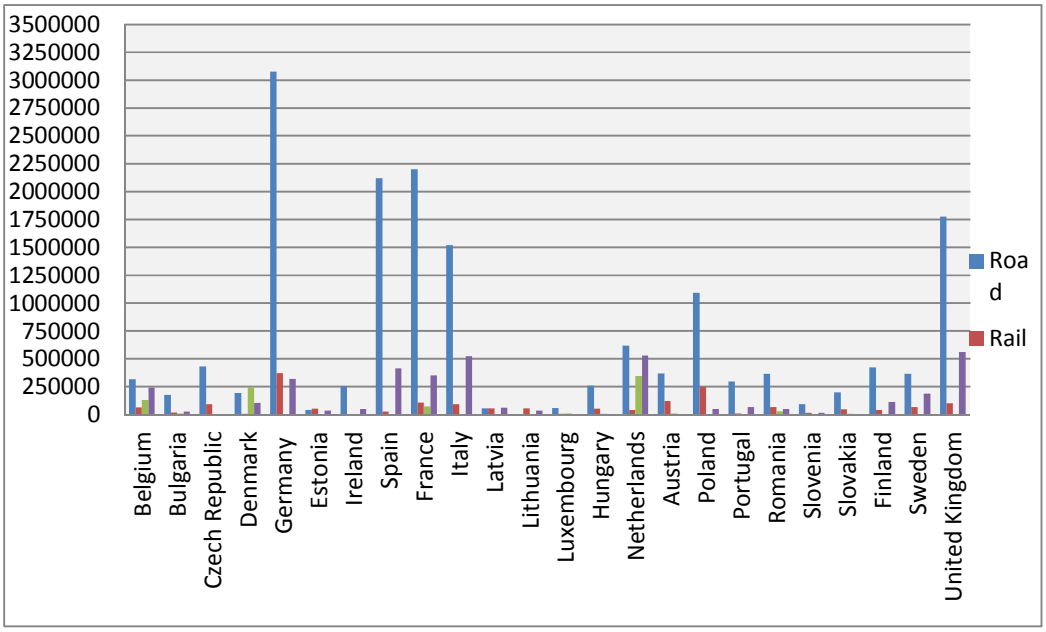

Figure 4: Freight volumes by mean of transport in 2008 (thousand tonnes), data source:

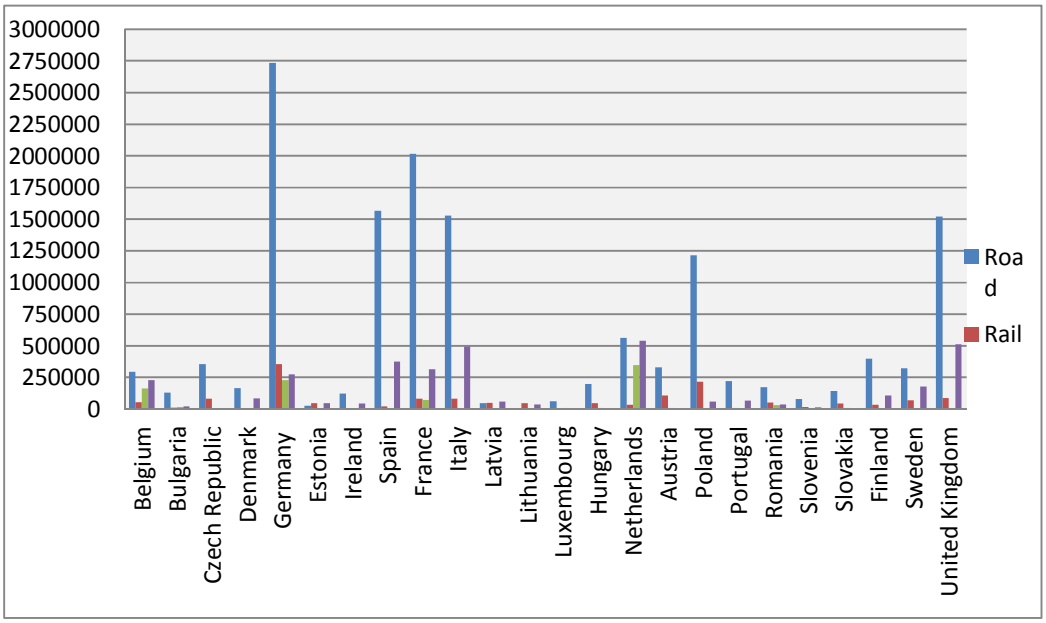

Figure 5: Freight volumes by mean of transport in 2010 (thousand tonnes), data source:

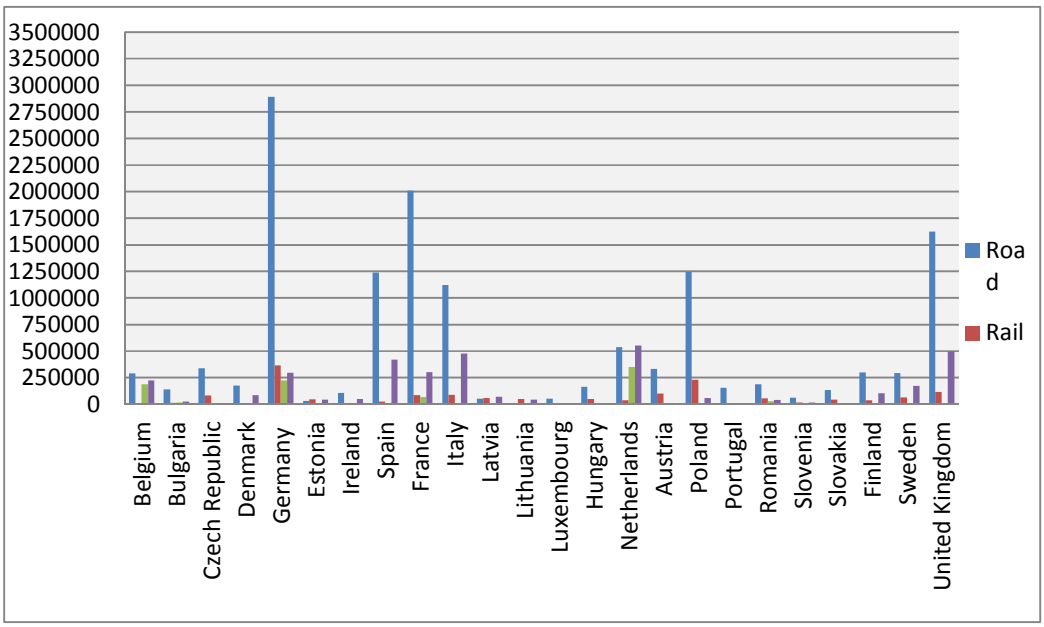

Figure 6: Freight volumes by mean of transport in 2012 (thousand tonnes), data source:

The results for all three years show that freight volumes in countries from the third cluster are predominantly transported by road, which justifies the high level of emissions resulted from the Cluster Analysis. This trend was to be expected. According to Amekudzia, A.A., Khistyb, C.J. and Khayesic, M. (2009) *"at the G8 Meeting of leaders of the world's most economically developed countries, held in June*

2007 in Hieligendamm, Germany, there were ''no hard goals on climate change." Poland's transportation is also based on road transport, although the country positioned itself in less polluting clusters. As second transportation choice, countries like United Kingdom, Netherlands, Italy, France, Spain, Belgium, Sweden or Finland chose sea transport, while Germany, Poland, Austria, Czech Republic and Romania rail transport. The Cluster Analysis for 2008, the first year of economical crisis, revealed that Estonia, which according to Kobus, D. (2005) *"experienced a rapid transition, from an autocratic command-and control system to a liberal market economy"* and Latvia were building alone the most performant cluster regarding energy consumption and were the less polluting. A reason for these results is the efficient and balanced modal split of freight transport, respectively road, rail and sea transportation. Moreover, in 2008 Estonia was the only country which transported it's most freight volumes by rail, which is less polluting compared to road transport. During the crisis, in 2010, despite moving into a less performant cluster, both countries began developing their sea transportation, which in Estonia almost equaled rail transport, while in Latvia had overtaken it. This trend remained valid also for 2012, both countries remaining less polluting than others. Going further with the analysis, despite the significant impact of the crisis on transported freight volumes in 2010, it is interesting to see the way countries react in reorganizing their means of transport. One can observe, that during the crisis, road transport was the most affected in all countries, although it still remained the most preffered mean, while in countries like Germany, France, Italy, Poland and United Kingdom, rail transport registered yearly almost the same values and in Ireland and Netherlands sea transport registered an increase. The same uptrend was registered also for IWW (inland waterways) transport in Belgium, which in 2012 positioned itself into the less polluting cluster, regarding particulate matter and the most competitive cluster regarding HICP.

Conclusions and discussions

The role of transport in sustainable development was first recognized at the 1992 United Nation's Earth Summit and reinforced in its outcome document – the Agenda 21. Several chapters, as for example Chapter 9 on Atmosphere and Chapter 7 on Human Settlements recognize Transport as a key development issue. This paper analyzed the transportation sector within the European countries from a sustainable development perspective. Within the framework of the cluster analysis, several indicators concerning economic and environmental dimensions of the sustainable development process were employed. This paper is a valuable policy tool for countries like Romania, which dispose of more than two means of transport and which are in the process of improving their sustainable development indicators until 2020.

Oberhofer, P. and Fürst, E. (2013) explore "*the implementation of environmental management in the Austrian road freight transport sector."* According to the same authors "*'environmental management' usually refers to activities aimed at reducing the unfavourable impact of a company on its environment."* This includes its products throughout their entire life cycle (Klassen and McLaughlin, 1996, p.1199; Santos-Reyes and Lawlor-Wright, 2001; Ammenberg and Sundin, 2005). Thus it has both an organisational and a product-related dimension (Tibor and Feldman, 1996).

According to Griškevičiūtė-Gečienė, A. and Burinskienė, M. (2012) Lithuania's "Project Funding" concentrated itself with help of a financial support from the European Union on *"investment projects related to reconstruction of priority urban bypasses, bridges, one level and multimodal crossings, highways together with the anticipated funding"*. The same objectives were find also for the country's "State Investment Program".

France introduced "multi-modal schemes" for collective transport services for both passengers and freight, which according to the European Conference of Ministers of Transport (2004) *"strike a new balance between modes of transport and travel, to frame a new approach to public choice and to strengthen transport policy in terms of multi-modality and the quality of the services offered."*

Lai, K.H., Lun, V.Y.H., Wong, C.W.T. and Cheng, T.C.E. (2011) mention in their work "green shiping practices (GSPs)" as solutions for transport companies *"to green their operations."* Some examples are given and include: *"counting the carbon footprint of shipping routes and using alternative transportation equipment with the aim of reducing environmental damage in performing shipping activities."* The International Chamber of Shipping and International Federation put pressures with the use of Environmental Compliance on shipping companies to adopt GSPs. This regulation act helps in ensuring compliance with MARPOL, The International Convention for the Prevention of Pollution from Ships. Moreover Lai, K.H. et al. also give some examples of transportation companies from different countries, that made themselfes a priority in becoming more sustainable. One example is French Company CMA CGM, a leading container shipping group. *"The firm offers the River Shuttle Container service to transfer goods between main and secondary ports by feeder ships that have a higher carrying capacity than trucks. Using feeder ships to provide shuttle service reduces carbon emission in terms of gram/tonnes-km versus road transportation using trucks."* (Lai, K.H., Lun, V.Y.H., Wong, C.W.T. and Cheng, T.C.E., 2011) the company tries to limit it's environmental negative impact generated by CO2 emissions and at the same time to reduce fuel and oil consumption by *"acquiring new ships and incorporating the latest technologies."* (Lai, K.H., Lun, V.Y.H., Wong, C.W.T. and Cheng, T.C.E., 2011) *"To reduce sulphur oxide emissions, CMA CGM uses a low sulphur fuel that has an estimated sulphur content of only 2.7%. Furthermore, CMA CGM introduces an "eco-speed" program to reduce the speed of its vessels. This program allows the reduction of fuel consumption and CO2 emissions while optimizing vessel utilization."* (Lai, K.H., Lun, V.Y.H., Wong, C.W.T. and Cheng, T.C.E., 2011) Due to the environmental expectations of their stakeholders, shipping firms green their operations via satisfying various requirements such as obtaining ISO 14000 certification in compliance with the ISM Code (Celik, 2009). In order to give more examples on how to green shipping activities Lai, K.H., Lun, V.Y.H., Wong, C.W.T. and Cheng, T.C.E., 2011 present the example of a Danish leading shipping firm, A.P. Moller-Maersk Group (Maersk). Examples of the use of GSPs include: *"the Voyage Efficiency System (VES) to identify the most fuel-efficient route and pursue a just-in-time steady running strategy."*

Krozer, J., Mass, K. and Kothuis, B. (2003) give an example of policy designed to reduce SO2 and NOx substances in Sweden, which *"charges NOx and SO2 emissions, in port"*. Moreover, the same authors consider that "*air pollution by NOx can be reduced by pollution control equipment like low-NOx burners with water injection and selective catalytic reduction."*

Awasthia, A. and Chauhanb, S.S. (2011) present some measures proposed by transportation experts: *"Clean fuels like electricity, biodiesel, etc.; Energy efficient vehicles options like Stop-and-Start engines, etc.; Trip reduction in private vehicle movements in the city, for example, carsharing, park-and-ride, access control zones.;Restrictions on the entry time and size of vehicles entering the city.; Pricing measures like carbon tax.; Regulatory policies on passenger and freight transportation.; Technology adoption like intelligent transportation systems."*

Anderson et al. (2005) present means and measures through which freight transport can be made more sustainable. This includes development of low emission zones, congestion charging, weight restrictions and time restrictions. Green logistics and green supply chain management are other examples on how to improve logistical performance while remaining sustainable.

Brian Garda Muchardie, Binus Online Learning, Bina Nusantara University, Jakarta, Indonesia, brian_muchardie@binus.ac.id

Abstract

Over the past 2 decades, Generation Y, which is often called Millennials, has become an important market segment. A phenomenon that emerged lately is the millennial moms are busy uploading photos of their children in such a way they dress through various social media like Facebook, Instagram, and Path. Although Millennials form a potential market segment, but Millennials is not a homogeneous group, so that millennial moms' shopping behavior can not be uniform due to the diversity of characteristics, both demographic and psychographic. To that end, it is important for marketers, especially kids apparel retailer, to divide this market into segments that are more specific, so that each segment can obtain a different treatment from marketers. The purpose of this study was to establish a kids apparel market segmentation based on the behavior of the millennial moms and determine whether there are differences in demographic characteristics between the segments formed, to eventually be able to provide recommendations for marketers of kids apparel retailer in Jakarta related to the differences in the character of the segments exist. Data was collected by survey method through questionnaires which are distributed to 306 people millennial moms in Jakarta. The analysis technique used is Cluster Analysis and Multiple Discriminant Analysis. Results from this study stated that there are 4 segments formed, namely shopping maniac moms, buy whatever moms, too much thinking moms, and reasonable choice-making moms, where there are significant differences in shopping behavior among the four segments.

Keywords: Kids Apparel Market Segmentation, Millennial Moms, Shopping Behavior

Introduction

Recently, based on the results of surveys that have been conducted, it is one of the leading manufacturers of baby products in the UK, My1stYears.com, claimed Suri Cruise (daughter of Katie Holmes), Blue Ivy (daughter of Beyonce), and Kai Rooney (daughter of Mary Coleen Rooney) as the most fashionable children, where the three mothers are millennial moms (Katie Holmes was born in 1978, Beyonce was born in 1981, and Mary Coleen Rooney was born in 1986).

In Indonesia too, the millennial celebrity moms are busy showing off their children by dressing them to follow fashion trends, one of which is Almira Tungga Goddess Yudhoyono (daughter of Annisa Pohan, who was born in 1981), who also participated in a fashion show her mother held later. From the observation of researchers that has been done before, this phenomenon is also coupled with the increasing of photos uploaded by the millennial moms showing their children dressed in such a way through various social media like Facebook, Instagram, and Path.

Over the past two decades, Generation Y or millennials, has become an important market segment (Noble et.al, 2009). Currently, 21% of millennials have discretionary consumer purchases which are estimated at more than 1 trillion dollars in direct purchasing power and greatly affect the older generation (Butler, 2014). Within a period of ten years, 80% of the millennials will have a family, and 83% of "new moms' have now been located in this age group (Butler, 2014). By doing so, it can be said that this age group is a large-sized segments with greater spending power (BabyCenter 21st Century Mom, 2014).

Due to the characteristics of each generation is different, it is important for marketers to treat customers in a variety of different age groups (Rempel, 2009). For example, the buying process of the baby boomers begins with the consumer trust to retailers who provide advice to choose the right product, whereas the millennials buying process begins with the selection of products (Parment, 2013).

Despite millennials form a potential market segment, but further, Butler (2014) mentions that millennials is not a homogeneous group. This is in line with the exploratory research that has been conducted by previous researchers, that the millennial moms shopping behavior can not be uniform due to the diversity of characteristics, both demographic and psychographic.

To that end, it is important for marketers, especially kids apparel retailer, to divide this market into segments that are more specific, so that each segment can obtain a different treatment from marketers. And in the end, the strategy adopted by the kids apparel retailers can be better targeted and lead to an increase in purchasing decisions made by the millennial moms for their children, given the huge potential market in this industry.

In terms of academic, previous research has been done by Mafini, et.al (2014) produced a typology of millennials consumer spending on apparel market. However, researchers have not found other studies that have been done on segmenting millennial moms in Jakarta on kids apparel market. To that end, the researchers want to apply the spending typology on kids apparel market to produce kids apparel market segmentation in the millennial moms, supported by the results of exploratory research that has been done by Gunawan, et.al (2014), which reveals millennial moms shopping behavior throughout the buying decision process. Further, after the obtained results of millennial moms market division into different segments, it is necessary to know whether there are differences in shopping behavior between the segment as a whole, as well as what factors that distinguish character of the four segments most. From the results of these studies, the researchers can ultimately provide recommendations for kids apparel retailers in Jakarta regarding the appropriate treatment for each segment.

Thus, the purpose of this study was to determine the segmentation for kids apparel market based on behavioral characteristics of the millennial moms and to determine whether there are significant differences between segments that are formed on kids apparel market.

Literature Review

Millennial Moms is defined as a mother who was born in 1978 to 1994. The women who are classified in the millennial mom use social media more than mothers in general, and they utilize technology to assist them in managing their lives (Goggin et.al, 2014). As the first generation to grow up with the Internet and mobile devices, Millennials are also the first generation that did not feel strange toward the behavior of foreign tweeting and texting with Facebook, Google, Wikipedia, and YouTube, but as a normal aspect of their social life in the search for information (Aquino, 2012). As Kotler et.al (2012) stated the following: "They do not just embrace technology, it's a way of life".

Millennial Moms applying different ways in what way they were raised, they feel more relaxed and happy as parents and they eliminate all the pressure that they get when they grew in the past (BabyCenter 21st Century Mom, 2014). This relates to the buying behavior of the children goods made by the millennial moms who doesn't only meet the needs, but it is also a pleasure for them. Children's apparel products are more creative in terms of style and design to provide more alternatives for the millennial moms to 'dress' their children, even is already started when their child is still a toddler.

Related to the children fashion needs who do not spend little money, Peter et. al (2010) have stated that the children indeed had a considerable effect on the family budget allocation decisions and purchasing choices made within the family. According to the survey conducted by Marketing Charts (2014),

millennial moms identified 18% more than other mothers as 'spenders' rather than as 'saver'. This is the result of individuals who belong to a group of millennials who grew up in contemporary society-oriented consumption, and they have more money in their youth than the previous generation (Kennedy, 2001).

One of the unique shopping behavior of a group of millennial moms is that they prefer to purchase apparel products in the store, but by looking for previous information in advance about the products to be purchased. A study by Forest City and Alexander Babbage revealed that 71% of monthly expenditure of millennials group made physically in the store, and 60% of their shopping time spent to find out about the products to be purchased before visiting a store to interact directly with the product (Loboda, 2014). According to a statement from Solis (2011), that millennial moms seeking information as much as 9.2 times per month when buying a product.

There is diversity in the typology of consumer spending, as mentioned by Butler (2014) that millennials are not a homogeneous group. Consumers tend to show a different shopping orientations, based on personality and individual characteristics (Bae, 2004). Mafini et.al (2014) typology divides Millennials consumer spending on apparel products into 7 groups, as described in the following table:

Table 1: Typology of Millennial Consumers on Apparel Products

Research Methodology

The research population is all women aged 21-37 years who were included in the millennial generation, who already have children, and live in Jakarta. The researcher use questionnaires distributed to 306 samples taken randomly, weighted by using Likert scale as below:

a. Value 1 = Extremely Agree (EA)
b. Value 2 = Agree (A)
c. Value 3 = Neutral (N)
d. Value 4 = Disagree (D)
e. Value 5 = Extremely Disagree (ED)

Variables in this research can be operationalized in the Table 2 and Table 3 below. The indicators of millennial moms shopping behaviour variables are adapted from Mafini's millennial consumers typology on apparel products (Table 1).

Table 2: Operationalization of Shopping Behaviour Variables

Table 3: Operationalization of Demography Variables

Results and Discussion

To analyze the data in this research, some techniques are used. After validity and reliability test are done, Cluster Analysis and Multiple Discriminant Analysis are used to answer the research questions.

Profile of Respondents

The profile of respondents in this research can be shown through Figure 1, Figure 2, Figure 3, Figure 4, Figure 5, and Figure 6 below.

Fig 1. Age of Moms

Fig 2. Age of Kids

Fig 3. Gender of Kids

Fig 4. Occupation of Moms

Fig 5. Expenditures for Kids

Fig 6. Shopping Frequency for Kids

Validity and Reliability Test

All statements of the questionnaire have been tested, and the final results obtained are all of the items included in the calculation are valid and reliable. The result of validity and reliability test can be shown on the Table 4 below.

Table 4: Result of Validity and Reliability Test

So, all variables can be processed further in the Cluster Analysis and Multiple Discriminant Analysis.

Segmenting of Millennial Moms with Cluster Analysis

Table 5: Output of Final Cluster Centers

Based on Table 5, it showed shopping behavior characteristics of each segment. Members of segment 1 rate more positively against the fashion conscious, hedonistic, brand conscious, and novelty-seeking, compared to members of segment 2, segment 3, and segment 4. Members of segment 2 rate more positively against confused by over-choice and impulse buying than members of segment 1, segment 3, and segment 4. Members of segment 3 rate more positively against the budget concern compared to members of segment 1, segment 2 and segment 4. Meanwhile, members of the segment 4 assess more positively to quality-conscious and habitual than members of segment 1, segment 2, and segment 3. By doing so, it can be said that the first segment is 'shopping maniac moms', segment 2 is 'buy whatever moms', segment 3 is 'thinking too much moms', and segment 4 is 'reasonable choice-making moms'.

From the acquisition of SPSS output, it shows that from 306 respondents, 35 people entered the segment 1, 106 people entered the segment 2, 60 people enter the segment 3, and 105 people entered the segment 4. Of the four segments formed, it can be seen that most respondents are divided into segment 2 and segment 4. Meanwhile, the first segment is the segment with the least number of members.

Regarding the difference in distance between each cluster, from Table 5.4., it can be seen that the longest distance is between segment 1 (shopping maniac moms) with segment 3 (thinking too much moms), which means the difference between the two segments is the most significant. Meanwhile, the shortest distance is between segment 1 (shopping maniac moms) with segment 4 (reasonable choice-making moms), which means that both segments are the most resemble. However, out of the four existing segments, segments 3 (thinking too much moms) is a segment with the most prominent difference between the other segments.

Analysis of Between-Segment Difference with Multiple Discriminant Analysis

Table 6: Output Test of Equality of Group Means

From Table 6, it is known that there are differences between the four millennial moms segments based on factors fashion conscious, hedonistic, brand conscious, novelty seeking, quality conscious, confused by over-choice, habitual, impulse-buying, budget concerns, spending on the needs of kids, and

kids apparel shopping frequency. Meanwhile, in terms of age of moms, age of kids, gender of kids and moms' occupation, there is no difference between the four segments.

In addition, from the results of SPSS output, it is known that there are variance differences between the four segments in the millennial moms. Given also that the most dominant variables that can be used as an indicator that determine where the millennial moms should be segmented, are brand conscious, budget concern, and hedonistic variables.

With the data obtained at this time, the membership of millennial moms that fall into the category of shopping maniac moms can be predicted correctly by 71.4%, and membership of millennial moms that fall into the category of buy whatever moms can be predicted correctly by 90.6%, while membership of millennial moms that fall into the category of too much thinking moms can be predicted correctly by 96.7%, and membership of millennial moms that fall into the category of reasonable choice-making moms can be predicted correctly at 97.1%.

Implication of Research Result for Kids Apparel Retailer

From the results of processing and interpretation of the data above, the segment division of millennial moms can be summarized in the following table:

Table 7: Millennial Moms Segmenting on Kids Apparel Market

Shopping Maniac Moms

This segment consists of millennial moms from 25-32 years old with toddler sons (> 3-5 years), but has enough budget allocation for the needs of their children (over Rp 3 million) although they only work as a housewife, then it is likely this segment is the wife of the upper-middle-income men. Millennial moms in this segment consists of women who are concerned with appearance and follow fashion trends for themselves, so that they also apply it into their children as well. In addition, because they have sufficient budget to support their shopping hobby, this segment is quite often make purchases of kids apparel products (4-6 times in 3 months) to explore new arrival models.

However, they are quite selective in choosing kids apparel products to be purchased by a brand. In harmony with their social class and fashionable character, then this segment is very brand concerned with the goal of maintaining pride, including for their children. Not only being the fans of the famous brands, but this segment also requires diversity in the selection of models and colors of kids apparel, because their character is looking for variation (novelty-seeking).

Thus, kids apparel retailers that target this segment is not enough to 'sell' quality only to this segment, but also require model and color varied apparel, mannequin models arrangement and display that follow the trend, attractive and comfortable shopping atmosphere to support the activity of shopping, as well as short time stores stock turnover and display of new arrival models at the spot that could attract the attention of shopping maniac moms.

Buy Whatever Moms

Not too much difference from shopping maniac moms, this segment also consists of millennial moms aged 25-28 years who is a housewife and has children aged >3-5 years. The difference is that this segment of moms do not have as much as shopping maniac moms budget. This segment often buy kids apparel products (4-6 times within 3 months) due to the encouragement of diverse offers or promotions from retailers. They are easily motivated by impulse when passing through a store that seems to offer

many choices of apparel models. However, because of its limited budget, then buy whatever moms are not too brand oriented and looking for a product that looks nice but tend to be cheaper.

Thus, kids apparel retailer that targets this segment relies heavily on display and store layout that could expose various selection of models and colors to stimulate buy whatever moms. In addition, retailers can also take advantage of the active shopkeepers that can act as a problem solver for consumers who visit the store, by offering options of existing products according to customer needs.

Thinking Too Much Moms

Thinking too much moms are dominated by the millennial moms moms aged 25-28 years who are just starting their role as a mother, in which their children are aged >1-3 years. In contrast to other segments, this segment consists of millennial moms who work as staff-level employees, so that the budget allocated for the needs of young children are also limited (> Rp 1 million - Rp 3 million). Moreover, their time isn't as much as housewives', then this segment also do less shopping in kids apparel products, which is only 1-3 times within 3 months.

This segment is the most different segments of its own with the three other segments (Table 5.4), because they make the price as a primary consideration in the selection of kids apparel products and don't think of other factors. Most important for this segment is efficiency, because of limited time and budget. It is also due to the age of the children who are smaller, so they can not be too explored to be fashionistas, so what is important is the low price.

Kids apparel retailer that makes this segment as its target market depends only on a competitive price, or at least 'look' cheap for thinking too much moms. The one that is exposed in the store is the price or sale board, this is what can attract this segment to visit the store. In addition, the bundling strategy could also be applied, because this segment seldom take the time to shop kids apparel products and just spend as needed, so it is possible for this segment to implement a system of 'stocking' apparels for their children.

Reasonable Choice-Making Moms

This segment consists of millennial moms aged 33-37 years and their children had passed the age of kids (> 5-8 years). Their profession is a housewife and they have large enough budget for the needs of their children (> Rp 3 million), but only spend kids apparel product as much as 1-3 times. It could be said that this segment is a mature version of the segment shopping maniac moms.

Reasonable choice-making moms basically like shopping and supported by a large budget, but because they are already mature, then they no longer focus on trend or just a hobby of shopping without direction. They are oriented towards product quality for children, and is not concerned with the model. Because they are quality oriented, then they usually have subscription brand or store to shop kids apparel products.

Kids apparel retailer that targets reasonable choice-making moms depends on the trust that can be embedded in customers. Trust is based on consistent quality which is maintained by retailers, mainly about product material used. To that end, retailers should be able to highlight the superior quality in its products and maintain the credibility of its brand. In addition, retailers who play in this segment need to maintain a good relationship with reasonable choice-making moms, because they are a potential market to be a loyal customer over the long term.

Comparison Among Segments

Overall, the four segments have different shopping behavior and characters, except in the case of age of moms, age of kids, gender of kids and occupation of moms, no significant differences were found among the four segments. But beyond that, if seen from the factor fashion conscious, hedonistic, brand conscious, novelty seeking, quality conscious, confused by over-choice, habitual, impulse-buying, budget concerns, spending on the needs of kids, and kids apparel shopping frequency, the four segments are each have a difference.

Despite the difference in each segment, between segment shopping maniac mom, buy whatever moms, and reasonable choice-making moms tend not to have much difference. Segment thinking too much moms are the most different segments than the three other segments. This is because the most dominant variable that acts as a determinant of the distribution segment is a budget concern. This can be a consideration for kids apparel retailer to determine its target audience, mainly based on price.

However, it turns out that age of moms and gender of kids did not really give an impact on shopping behavior of millennial moms in general, because the two variables aren't found to be correlated with the distribution segment. Factors that are more appropriate to be used as the basis for determining the target market is age of kids, occupation of moms, allocation of expenses to the needs of kids, and kids apparel shopping frequency products. It could be said that the reasonable choice-making moms is not a mature market in terms of age of moms, but growing age of kids and time range of millennial moms being the mother that makes her shopping behavior is more stable.

In terms of the number of members of the segment, the segment buy whatever moms and reasonable choice-making moms are the segments with the largest size, so they are more potential for being targeted. What should be noted is that both segments are conflicting, making it more difficult to target both these segments simultaneously. Next, segment thinking too much moms are the second largest segment which is potential for targeted, as well as fashion-maniac moms have the fewest members. In other words, most of the millennial moms in Jakarta is not oriented on the trend or brand, but the models that are varied (buy whatever moms) and guaranteed quality (reasonable choice-making moms).

Conclusion

There are two points of conclusion that can be taken from this research. First, there are 4 segments of millennial moms formed on kids apparel market, which is shopping maniac moms, buy whatever moms, too much thinking moms, and reasonable choice-making moms. Overall, there are significant differences in shopping behavior among the four segments of the millennial moms on kids apparel market, as well as a very dominant variables that can be used as an indicator that specifies the determination of segmenting millennial moms is budget concern variable.

Table 1: Typology of Millennial Consumers on Apparel Products

Factors label	Factor description
Fashion conscious	A characteristic representing a consumer who is motivated to keep up to date with styles and fashion trends.
Hedonistic	A characteristic measuring the degree to which a consumer finds shopping activity enjoyable and shops for the fun of it.
Brand conscious	Measuring a consumer's orientation to buying the more expensive, well-known brands.
Novelty seeking	A characteristic identifying consumers who appear to like new and innovative products and gain excitement from seeking new products.
Quality conscious	A characteristic measuring the degree to which a consumer searches carefully and systematically for the best quality in products.
Confused by over-choice	A characteristic identifying those consumers who perceive too many brands and stores from which to choose, experiencing information overload in the market.
Habitual, brand loyal	A characteristic indicating consumers who have favourite brands and stores, who have formed habits around these.

Table 2: Operationalization of Shopping Behaviour Variables

Variables	Indicators	Measurement Scale
Fashion Conscious	Buying kids apparel products because they always want to make their children look fashionable	Likert
	Buying kids apparel products because they always want to make their children follow trends	
Hedonistic	Usually buying kids apparel products because they have a hobby of shopping	
	Often shopping kids apparel products without taking much account on budget	
Brand Conscious	Buying kids apparel products based on well-known brand products	
	Buying kids apparel products based on famous brand stores	
Novelty-Seeking	Like to buy kids apparel products because likeliness with the new models offered	
	Often buy kids apparel products because get bored quickly with the old models	
Quality Conscious	Buying products with kids apparel products quality as a primary consideration	
	Always buy kids apparel products whose quality is guaranteed	
Confused by Over Choice	Usually confused with a variety of information on kids apparel products which are very diverse	
	Usually confused with the various offers on kids apparel products are very diverse	
Habitual	Has favorite brand in purchasing kids apparel products	
	Has favorite store in purchasing kids apparel products	
Impulse Buying	Buying kids apparel products because of interest in store displays	
	Often buy kids apparel products without planning before	
Budget Concern	Make the price as one of the main considerations for buying kids apparel products	
	Often prefer kids apparel products whose price tends to be more affordable	

Table 3: Operationalization of Demography Variables

Variables	Variables Definition	Answer Classification
Age of Moms	Age of millennial moms	1 = 21 – 24 years 2 = 25 – 28 years 3 = 29 – 32 years 4 = 33 – 37 years
Age of Kids	Age of kids of millennial moms	1 = 0 – 1 years 2 = > 1 year – 3 years 3 = > 3 years – 5 years 4 = > 5 years
Gender of Kids	Gender of kids of millennial moms	1 = Male 2 = Female
Occupation of Moms	Occupation of millennial moms	1 = Housewife 2 = Private employee (staff level) 3 = Private employee (manager or above) 4 = Public employee 5 = Entrepreneur 6 = Proffesion (teacher/ lecturer/ doctor/ lawyer/ dll) 7 = Part timer
Expenditure for Kids	The average of expenditure spent for all children needs	1 = < Rp 500.000 2 = Rp 500.000 – Rp 1.000.000 3 = Rp 1.000.000 – Rp 3.000.000 4 = > Rp 3.000.000
Shopping Frequency for Kids	The average of frequency of expenditure on kids apparel products within 3 months	1 = < 1 time 2 = 1 – 3 times 3 = 4 – 6 times 4 = > 6 times

Downshifting: Escaping the Rat Race

Krinitcyna Zoya Vasilievna, associate Professor, Tomsk Polytechnic University, Tomsk, 634021, Russia, zoya.tpu@gmail.com

Kopilevitch Valeria Vadimovna, associate Professor, Tomsk State University, Tomsk, 634050, Russia, vkopi@rambler.ru

Mikhailova Tatyana Romanovna, student of management department, Tomsk Polytechnic University, Tomsk, 634021, Russia, mihailova.t.r@yandex.ru

Abstract:

The paper discusses the concept of downshifting and the attitude of various authors. The analysis of the main reasons for downshifting is given, the most common reason is shown - the desire of the employee to have a harmonious balanced life. It is shown that there are different types of downshifting in Russia, such as a brief timeout, as well as a retreat from the world of business; passive and active types of downshifting. Examples of downshifting in Russia and abroad are given.

Keywords: downshifting, downshifted, "voluntary simplicity", corporate rebel, spontaneous and deliberate types of downshifters, active and passive downshifting

The concept of downshifting

Just a few years ago in Russia appeared a new western term “downshifting”. Downshifting (switching a car into a lower gear and slowing or weakening of any process) is a term denoting philosophy of life as "a life for me", "abandoning the goals of someone else". Synonyms of this term in English-speaking countries are a "simple life” and "voluntary simplicity". In practice, this means that successful people leave their very successful career, full of stress and time constraints, and head for a remote village or in some warm country. A historical example of the first downshifter may prove to be the Roman Emperor Diocletian who voluntarily retired from public life into seclusion and found "happiness in the cultivation of vegetable garden". The greatest number of downshifters are in the US (30% of Americans) and Australia (26% of Australians). Moreover, there is a pattern: the higher the average standard of living in the country is, the more people will reconsider their attitude to career, earnings and income.

This strange idea has aroused great interest in the Russian HR community. Number of materials about downshifting started appearing in the business press and at various specialized portals. One of the first in Russia was the article "shorting" of the magazine "Secret of Firm" by Sokolov A. (2008). The article presents the results of a study of dissatisfaction of western downshifters: 34% are completely satisfied with their new life, 37% are satisfied but sorry about the decline in revenue, 16% were seriously affected by the loss of former wages, and only 7% were not satisfied with changes in their lives.

The term downshifting and the phenomenon of downshifting were popularized in an article posted on 31 December 1991 in the newspaper "Washington Post" by Sarah Ban Breathnach “Living in A Lower Gear: Downshifting: Redefining Success in the '90s. The heroine of the publication (Amy Saltzman) meets with friend and colleague on the street. Friend is in a hurry at full speed and casually asked how things were going, to which the heroine replied: "All is well, the work is interesting, but I don't allow it to fully absorb me. Several times a week I volunteer in the evenings, read a lot, and also I am writing a story: it is unlikely to be released, but I still like it." It puzzled her friend, and Salzman

explains: "I made a conscious decision to slightly reduce the pace of life... I deliberately did not seek promotion because I realized that the new job would take too many evenings and weekends".
From this quote it is clear that the essence of downshifting is not life in the village but in life for himself. Not that you quit your job and move to a village house, but that you rely on your own wants and needs, not on what society imposes on you.

Attitude to downshifting

Attitude to downshifting is quite ambiguous. Some authors, such as Antropov S. (2015), believe that "downshifters are people experiencing temporary psychological difficulties, those who lost the meaning of life under severe stress at work and the burden of problems and therefore are vulnerable to various kinds of ideas and ways to "solve the problem in one fell swoop". They are clutching for downshifting as a solution to their difficulties, or simply call themselves downshifters following fashion". Therefore, the authors of this position believe that, "if you are inconvenienced by the office, the boss, the way of earnings – you might want to change jobs or to try freelancing. Maybe it's just only temporary difficulties, and tomorrow you will wake up in a good mood and will be glad that you have not quit your job for the illusive "happy life without money".

Other authors, such as Kholopov A. (2008), believe that these difficulties are not temporary, but they indicate a deep inner value conflict between the goals imposed by society - career, wealth, status - and internal values — self-knowledge, hobbies, communication with relatives etc. Downshifter is aware of the illusory nature of imposed goals, because as more wealth is acquired, the more you want. The problem is not so much in status and wealth, but in what price for them often has to be paid in society: stress, illness, lack of free time, family conflicts, etc. Choice of downshifter is a conscious refusal to participate in "the rat races", which implies the reduction of material income and is often perceived harshly by the loved ones and society. As the award downshifter gets internal satisfaction from life, the opportunity to do what he likes, to live as one pleases.

The authors - Petlin A. (2011) - of the third direction called downshifting a disease "affecting the areas of the brain responsible for the pursuit of social advancement and career ladder. The person becomes indifferent to the work, career, acquisition of new things, familiar to all normal people for being pleasant". Proponents of this position believe that the disease brings significant economic damage for individual companies and the industry itself. Even an example is provided: a talented young manager of a large energy corporation has been proposed a serious promotion. The management believed (not without reasons) that for the ambitious employee this will be a good incentive, but they were miscalculated - the young man was a downshifter: he said he was tired, then resigned and retired. It caused extensive damage to the company - the employee was engaged in three important projects and when he left, two of them closed. In the end $19 million, which the corporation invested in projects, were impossible to return.

Since 90’s this social and cultural phenomenon was widely circulated throughout the world, especially a lot of downshifters appeared in Australia, USA, UK. For example, Hamilton C. and Mail E. (2003) mention that in Australia the proportion of downshifters is 26%, and by the end of 2015, according to some forecasts, it will reach 50%. The most common among Australians methods "of descent on the social ladder» is to reduce the number of working hours (29%), transition to a less paid job (23%), refusal to work at all (19%), changing the scope of activities (19%). In the UK, the downshifting is closely connected with the environmental movement (the cultivation and consumption of ecological products), and is manifested not only at individual but also at the corporate level - use of recyclable materials, transfer of old office furniture instead of its destruction, etc. In the U.S. and Europe downshifting is manifested in the process of moving from cities to the villages to quiet family life. Women’s career refusal in favour of homemaking is also a common widespread practice of downshifting.

Russian downshifters are much smaller part in society (4-5%), due to several reasons:

- economic factors: the Russians unlike people in the developed world relatively recently started to live more or less decently and have not had time to feast upon the fruits of the consumer society;
- the standard of living in Russia is much lower than in the countries with the largest number of downshifters, confidence in the future is absent in almost all social layers;
- territorial issues - Russian villages are not civilized European villages.

However, it should be noted that downshifting has not only individual but also a social dimension, as studied by Fateeva M. (2012). In this case we are talking about the strategy of sustainable development of humanity, when the quality of life is not an end in itself, but the life is not achieved at the expense of future generations (environmental degradation, resource depletion, etc.). Many rightly believe that for the survival of humanity we need to seek new paradigms that will meet the high level of technical and spiritual development. Downshifting is one of the examples of such way to be happy, not taking efforts for it and not to be involved in a struggle with competitors.

Reasons for downshifting

According to research by Hamilton C. and Mail E. (2003) conducted in Australia, people who strive for downshifting have four main reasons.

The first reason is the human desire to have a harmonious balanced life without stress factors.

The second reason can be attributed to the reaction to contradiction between personal values and values imposed in organizations.

The third reason include the search for a more satisfying life. Downshifters believe that the realization of oneself in the career does not lead to positive results.

And finally, the last, fourth reason can be attributed to human health. In the downshifting they see a direct source of health.

Research conducted in England showed that the main reasons for downshifting can be attributed to people's desire to spend more time with their family. For older people downshifting is perceived as the main source of health, and for young - as self-realization without any imposed organization ideas. In the U.S. this social phenomenon is called differently - "voluntary simplicity". This term was coined by D. Elgin in the 60-70 years of the twentieth century. Under a voluntary simplicity he meant a stable balanced lifestyle.

Here should be added that in the west downshifters are mainly people aged 35-40 years and wealthy. Therefore, the western model of this phenomenon is quite different than in Russia, by the meaning. Classic western downshifting (lower income) is always a revolution in response to the requirements of the company. Downshifter is a corporate rebel, he suddenly puts his company in a disadvantage (and the industry as well). Such people are not welcome in large companies, as in Procter&Gamble, Mars and other citadels of commercial stability. The most interesting thing that these companies are the main producers of downshifters – corporate ethics requires much, giving only money and status in return, meaning not everything for some employees, in a research study by Kholopov A. (2008).

As shown by studies in Russia by Antropov S. (2015), downshifting for the Russians can have the following causes:

- family is above career – it is necessary to create or preserve one;
- constant stress, debilitating and, as the last straw, a nervous breakdown, and then the doctor's advice to take a calmer job;
- high level of responsibility for the management, there is not enough time not just for family and friends, but also to recover and relax;
- economic crisis for people that lost the usual level of income or jobless people who are looking for opportunities for self-realization and a place to survive unfavorable period.

Although all individual and depends on the temperament and character of a person, we can distinguish between two types of downshifters in Russia based on behavioural characteristics.

The first type is characterized by a spontaneous desire to join this course, which can be caused by some external events (such as severe stress) and represents a subconscious desire to hide, to run away from the problem, to be alone. Such people often come back into the profession.

The second type involves an informed choice that is based on the understanding of why we live. This is an informed decision, to which the man who has achieved significant career successes came for a reason. Being tired of the lifestyle that he leads, person realizes that for what he really loves and appreciates there is no free time for him. All of his powers and energy are spent almost for nothing and compensated only as the material goods that are essentially worthless. Ultimately, this kind of people change their lives, focusing on their inner world. Hence, we distinguish between the following types of this phenomenon.

Types of downshifting in Russia

Short timeout. As a rule, people who have achieved success in their careers but are pretty tired for this period of time, eager for new experiences and sensations, tend to go to a distant country to study its culture, lifestyle of locals, or just for a long vacation. Often these people prefer not to think about how long will such vacation last, however, they still expect to return home sooner or later.

The advantages of such breaks can be health for the body, the ability to listen to yourself, the vivid impressions of the journey and the realization that you have the courage to take risky decisions and to fulfill your desires. After such breaks, many people change their job or even a activity as a whole: instead of a corporate business, for example, they start their own projects. And sometimes the relaxation and new experiences can give a boost to career growth.

Withdrawal from the world of business. This is the most extreme and "real" view of downshifting, which implies a complete rejection of the goods. There are people who deliberately leave the property in the cities and move to an exotic country or to the Russian heartland without a return ticket. Popular destinations for "travellers" — countries of Asia, India, Tibet. There they can join, for example, different religious groups, monasteries or just find like-minded people. And there they can organize their own small businesses, as a rule associated with a favourite hobby that will generate income and not take up too much time. The duration of such trips can reach several years, and for some they continue through their life.

For example, as mentioned by Fateeva M. (2012), the marketing director of a manufacturing company moved to Goa, took up yoga and meditation, revised her values and understood how to find peace of mind. After two years she decided to return home, but didn't want to work in a corporate environment anymore and she has just organized a children's charity.

Sociologist Ovechkina Y. V. (2013) basing on the degree of activity distinguishes between active and passive downshifting.

The main ideology of a passive type focuses on internal, individual needs, the desire to reject society's values. Describing this type, we can distinguish between 2 degrees of care: "easy" downshifting and "deep" downshifting. "Easy" downshifting is a decrease in work hours, transition to a free, flexible schedule (freelance), reducing the level of consumption and, as consequence, reduction of expenses, the transition to a more "economical" version of life. Thus, the workers, who earlier held the position of top managers, begin to devote more time to leisure, family and their inner world, changing expensive cars to bicycles, urban dwellers migrate to the villages and third world countries, they are switching to organic food and to the so-called style of "simple living" (a simple life). Followers of this movement are characterized as people who are trying to consume less and wiser, thinking about the environment, the energy, their internal, psychological health. This type is

especially well developed in the US and the UK. For the passive type we can attribute an emerging movement of downshifters in Russia.

Active downshifting is a type of complete rejection of the values of society, a sharp decrease on the social ladder. Proponents of this method tend to a drastic change of the place of work and positions: from a position of senior manager to the paperboy or cleaner (funds are perceived not as an indicator of status but only as a means to survive). In the U.S. and Europe, a community of "active" downshifters is growing and developing. Antiparasitaire activism of downshifters connects with homogeneous ecological activism, the fight against globalization and activism for animal rights, environmentalism. The society of consumption is gaining tremendous momentum and this momentum itself is causing people to "reduce speed" of life and consumption as a part of it. New values emerge - values that have been previously replaced in society by consumerism and careerism. Active downshifters may organize political parties in the future to influence public opinion, attracting a growing number of people to their own ranks.

An example of such active downshifting is a boom of ecovillages around the world. There are over 2000 successful communities on Earth, 420 eco-villages and settlements of kin's domains are active in Russia – all of this suggests that we live in a transitional time. Why? This question is well attributed to Dianne Christian, researcher of the world's settlements in her book "Creating a Life Together: Practical Tools to Grow Ecovillages and Intentional Communities" (2003), translated in 2012 to Russian language. In her book she writes that at the moment we are experiencing some cultural and deeply personal phenomenon – as if something "clicked" in the psyche of many thousands of people. Many realize that we live in an increasingly fragmented, shallow, corrupt and frankly dangerous society; many are tired of the reality, where there are guns in school yards and crooks at high positions, so we yearn for a different life - a more holistic, meaningful, more accessible, a life where one can find warmth, kindness, togetherness and cooperation.

The division of priorities was, is and will be the main task of each man, and learn to manage yourself and your time is a skill not given to everyone. Downshifting is an example of the crisis of internal resources of the person trying to find a point of harmonious combination of material and spiritual needs and the resources they provide. In the modern pace of life, many attempt to keep up with some pointless objectives and often forget about the basics – and are too immersed in a career. People who replace personal life with work are often too sensitive to failure, which then results in nervous breakdowns. Therefore, it is important to the employer that the employee could not only work well, but for him also to have a wide variety of interests – so he probably can find a proper balance for himself, and his appeal to the downshifters is less likely than for a workaholic. It is needed to fill the employee with a sense of value and give him greater opportunity for self-realization, creativity and professional growth – and, for many, "horizontal" growth is acceptable. Therefore, the Russian business will only benefit if more people will be doing things they love and enjoy, without depriving themselves of the benefits of civilization.

Abstract

The relationship of socio- economic well-being from the applicable institutional mechanism for monitoring the well-being of this region is highlighted in article. Certain stages of institutional monitoring mechanism allow time to identify the problems of socio -economic development of the region and to identify ways to address them. The applying of different types of analysis which used in the monitoring, provide surveillance of the conservation and maintenance of successful social and economic sphere of the region.

Keywords: socio- economic well-being , institutional mechanisms for monitoring the functional cycle of monitoring, control monitoring;

Introduction

Socio-economic prosperity of the region depends on socio-economic development programs, which are developed, adopted and executed in the region. The monitoring process of these programs is based on the use of appropriate methods and principles of implementation. Logic of its realization formalizes the nature, content and importance of its functions. All this together forms a monitoring toolbox that is extremely diverse. Organizational mechanism of monitoring includes tools which greatly vary in complexity, significance, purpose, conditions of use and other features (from the principles of the formation and implementation of the monitoring process to construction of its organizational system). Organizational mechanism for monitoring can be defined as a set of elements of the monitoring process, which is expressed in the instrumental, informational, regulatory and staff support for this process, its organization in space and time, in order to obtain reliable information on the implementation of socio-economic development of the region (see. Fig. 1).

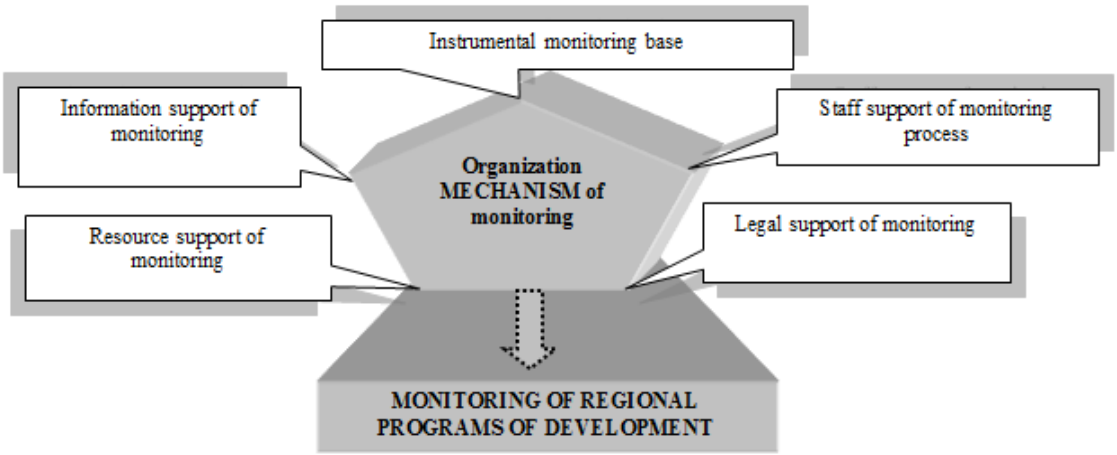

Figure 1. Organizational mechanism of monitoring of regional development programs

1 Functional monitoring cycle stages

Organizational mechanism of monitoring of regional socio-economic development is formed and operates within the framework of the monitoring cycle, which consists of 4 stages (Fig. 2). They can be identified as a functions of the monitoring process:
At the diagnostic function it is necessary to collect information, which will to explore the socio-economic condition of the region, the dynamics of the properties, characteristics and parameters of this state.

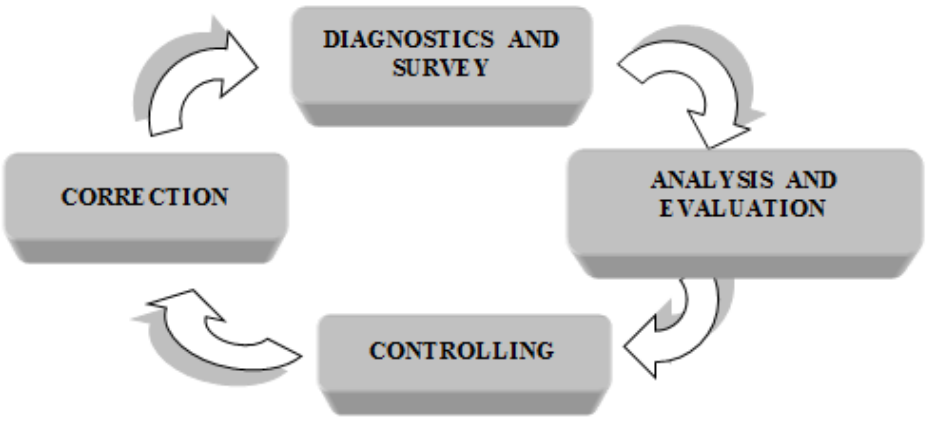

Figure 2. Functional stages of monitoring cycle

At the stage of *function of analysis and evaluation* of socio-economic development programs implementation, the information received is subjected to a thorough and comprehensive treatment, which consists of, first, comparison of the actual performance of the observed object with the plan. Secondly, the information is subjected to the system analysis. Third, all of the figures obtained are evaluated. Evaluation of complex systems can be carried out for different purposes, but in all cases, the general approach is based on the fact that the concept of "evaluation" and "evaluating" are considered separately and assessment is carried out in several stages. The sequence of evaluating of complex systems is as follows:

- Defining the purpose of evaluation. In system analysis there are two types of indicators of achievement. Qualitative indicators are those whose achievement is expressed in nominal scale or scale of the order ("better", "worse", "satisfied", etc.). Quantitative indicators of performance objectives expressed in numerical scales. Determining the purpose should be relative to the entire system (in this case, the program).
- Measurement of the properties of the program, essential for the purposes of evaluation. To do this appropriate indicators of properties are chosen. They should unite all areas of the program, which in the future will be guided by indicators of performance of all areas of the program.
- Justification of preference criteria of quality and performance criteria of the program on the basis of selected indicators of program properties.
- Evaluating itself. All indicators of different areas of the program are compared based on formed criteria and depending on the purposes of assessment are ranked, selected, optimized, etc.

Any system operates without significant disruptions and problems only if control function has been established to monitor its activities. This function allows to identify violations and take measures to rectify the situation (see. Fig. 3). ln regard to time factor, control can be divided into pre- and post-control. Of course, the effectiveness of the pre-control (especially if it is carried out at the stage of program development in the region) is much higher: one can not just simply identify violations, but to find their causes and eliminate them, not allowing a violation itself. The preliminary control in the

monitoring system may include control of objectives, projections and threats. Subsequent control is control of the implementation of plans, gaps between planned and actual program indicators.

Once all the information received has been carefully analyzed and systematized, control of plans, goals and projections has been implemented, it is necessary to develop a plan of action for further adjustments. These are changes that should improve the situation if it worsens, or consolidate positive trends.

Once all four functional stages have been fulfilled, the monitoring cycle is repeated. Therefore, monitoring is understood as a continuous process, which is not desirable to carry out only in a particular period of the program.

2 Methodological framework of institutional monitoring mechanism

Organizational mechanism of monitoring of regional development programs region has a specific methodological framework, which is based on formal methods of monitoring (Rayzberg B., Lobko A., 2002):

- economic analysis;
- discriminant analysis of program areas;
- analysis of documents of statistical information;
- analysis of executives' reports concerning program activities;
- monitoring interviews;
- monitoring survey;
- monitoring survey;
- surveillance of the monitored object, carried out based on the system the most important indicators characterizing its condition;
- etc.

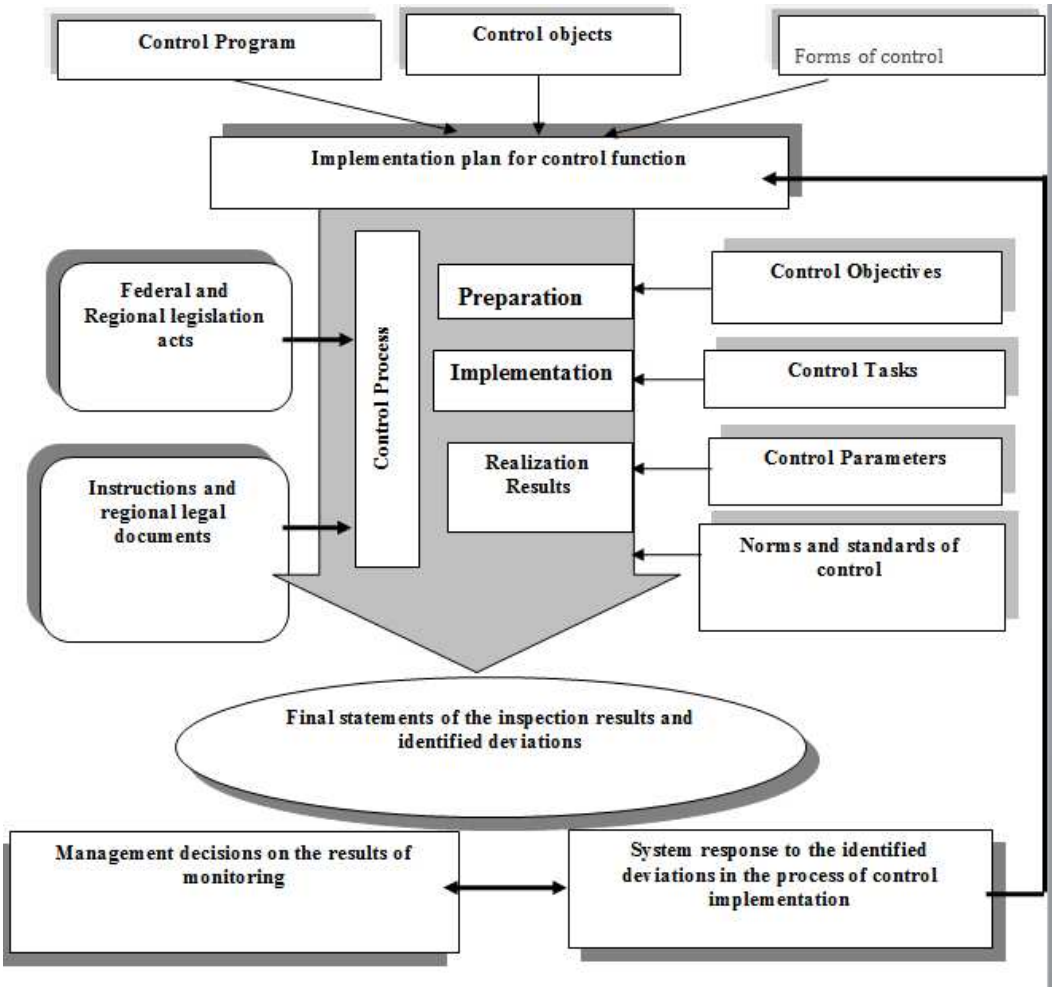

Figure 3. Formation of control function in monitoring

Organization of the monitoring functions consistently in the framework of target-oriented structure, which operates in the existing management system of the region. That is why during the systematic monitoring of the program steady vertical communications with the regional administration should be kept. However, connections of target-oriented structure with all the departments and executives of regional linear-functional structure should be primarily functional. This ensures the unity of command on the part of senior management of the program prevents the occurrence of serious contradictions in the performance of various programs, making the system stable under conditions of changing and diverse objectives and ensures the quality of monitoring.

One of the main requirements for quality of the monitoring is the presence of a single structure, coordinating the flow of information in the performance of the program among the structural units of administration, municipalities and businesses. In most of the existing government structures of regional administrations, these features are closest to economic services (economic departments / committees / offices) which may act as such coordinators.

As a rule, regional programs monitoring is carried out by program-target management body. However, it is also common when monitoring is carried out by an external organization, embedded into the existing organizational structure of the management of the program. In the framework of the monitoring this organization interacts with structural divisions of regional administration of the region, companies and organizations that are implementing

program activities, regional office of the State Committee of Statistics, concerning information on the progress of implementation of the program.

3 The flexibility of process control monitoring

It should be noted that one of the main problems of the organization of monitoring is a problem of flexibility of management process. This problem can be solved by creating new versions of the combined structures by introducing new program elements, such as committees, controls the program, expert working groups, etc. into the backbone of the existing program management structure. Thus, when designing an organization of monitoring system one should pay attention to the parameters of flexibility and adaptation to the regional development program. This includes:

- setting priorities for the strategic development in the work of program activities executives or departments of the regional administration;
- the degree of adaptation to changes in the development program in management decision-making;
- the degree of program activities focus, responsibilities, powers and subordination;
- the level of entrepreneurial abilities of program executives and regional administration in addressing the problems of development;
- Mobility in the formation of groups, coping with new challenges of development;
- the degree of effective coordination among monitoring participants;
- the ability of the organizational structure of the program to "compress" data as it moves up the hierarchical level.

Conclusion

The results of the practice of monitoring and evaluation of programs of social and economic development make it possible to draw important conclusions on the formation and functioning of the monitoring system in Russian regions:

- In use today organizational and management structures of regional administrations there are no divisions which carry out systematic monitoring functions. The lack of such services leads to the fact that the administrative structures use only current information and its external, surface layer, which only reflects the results of yesterday's activities and does not allow them to look into the near future.
- The results of the program monitoring are not always available to the general consumer, causing a negative attitude to the programs themselves. Therefore it is necessary to publish indicators of program effectiveness in the regional media.
- Program effectiveness criteria are often in conflict with each other, because they are not ranked by relevance to the development of the region.

In conclusion, we should point out that one should not neglect the importance of the organizational mechanism of monitoring of socio-economic development carried out on the territory of the Russia. This mechanism allows you to keep track of deviation from the objectives of social and economic development, to identify corrective actions necessary to preserve the well-being of regions.

What Drives the Decision to Switch to Islamic Banking? Evidence from the UAE

Abstract

Islamic banking has witnessed remarkable growth in the last few years. The purpose of this study is to explore the factors (religious or secular) which are more important in the decision of consumers to switch to an Islamic bank. A questionnaire was designed to collect data from the regular users of banking services in the United Arab Emirates. A total of 500 questionnaires were distributed, out of which 388 returned questionnaires were suitable for further analysis. The respondents were asked to complete a survey on consumer attitudes towards Islamic banking. Specifically, they were asked to rank several factors (either religious or secular) that would influence their decision to switch to Islamic banking. Responses were analyzed using descriptive statistics, analysis of variance as well as regression analysis. Results indicate that superior customer service, reputation, ability to survive, geographical proximity, and personal familiarity with Islamic banking concepts do not have a significant influence on the decision to switch to Islamic banking. Expectations of financial security, social responsibility, advanced banking technology and Arab-language skills are significant factors. Interestingly, though, the single most significant factor influencing the decision to open an account at an Islamic bank was found to be expectations regarding the bank's conformance to Islamic principles. This finding has important implications for Islamic banks operating in a predominantly Islamic environment. By identifying the specific areas where financial product awareness may be lacking, the paper will assist educators, regulators and financial institutions to design financial planning courses in helping young consumers to achieve greater financial freedom.

Keywords: Islamic banking and finance, conventional banking, consumer attitudes, switching behavior, religious, secular, UAE

Introduction

From modest beginnings, Islamic banking has witnessed remarkable growth over the last few years. According to the World Islamic Banking Competitiveness Report 2011 published by Ernst and Young, Islamic banking assets in the Middle East and North Africa (MENA) region increased to $416 billion in 2010, representing a five year annual growth of 20 percent compared to less than 9 percent for conventional banks. Globally, Islamic banking assets with commercial banks are expected to $1.1 trillion in 2012, representing a jump of 33 percent from their 2010 level of $826 billion (Ernst and Young, 2011). Licensed Islamic banking institutions operate in over 75 countries, both Muslim and non-Muslim (Al-Ajmi et al., 2009).

Islamic banking and finance (IBF) first began in 1963 through the Mit Ghambr Savings Bank in Egypt which offered interest free banking for the very first time (Karim, 2012). From these modest beginnings, Islamic banking has witnessed remarkable growth over the last few years. According to the World Islamic Banking Competitiveness Report 2011 published by Ernst and Young, Islamic banking assets in the Middle East and North Africa (MENA) region increased to $416 billion in 2010, representing a five year annual growth of 20 percent compared to less than 9 percent for conventional banks. Globally, Islamic banking assets with commercial banks are expected to $1.1 trillion in 2012, representing a jump of 33 percent from their 2010 level of $826 billion (Ernst and Young, 2011). Licensed Islamic banking institutions operate in over 75 countries, both Muslim and non-Muslim (Al-Ajmi et al., 2009).

Islamic banking and finance serves up financial services or products that are designed to comply with the main tenets of Shariah or Islamic law. An Islamic bank in particular has been defined by the Organization of Islamic Conference (OIC) as "a financial institution whose statutes, rules and procedures expressly state its commitment to the principles of Islamic Shariah and to the banning of the receipt and payment of interest on any of its operations" (Hassan, 1999). The Shariah derives its authority from various sources, including the Holy Quran, Hadith (the deeds and sayings of Prophet Muhammad), Sunna (the habitual practices of Muhammad during his lifetime), Ijma (consensus among religious scholars on issues not touched upon in either the Holy Quran or the Sunna), Qiyas (providing an opinion on a case not covered in either the Quran or the Sunna by using an analogous case referred to in either of the two), and Ijtihad (a jurist's independent reasoning relating to the applicability of Shariah to cases not mentioned in either the Quran or the Sunna) (Gait & Worthington, 2008).
Islamic banks offer a wide variety of products, summarized in the table below (Al-Ajmi et al., 2009):

Product/Service	**Explanation**
Murabaha	An instrument used for financing the purchase of goods and services where the Islamic bank purchases these on behalf of the customer
Mudarabah (joint venture)	The provision of capital to a partial-equity partnership in return for a share of profits, but when the losses on funds lent are borne by the financer (bank's client)
Musharakah (equity participation)	Full-equity partnerships where the provider of funds and the entrepreneur directly and wholly share in the business
Bai Salam	Advance or pre-paid sale contracts of agriculture products
Istisna	Manufacturing contracts to cover work in progress and paid by the Islamic bank on behalf of the customer
Ijarah	Lease financing in the form of operating leases only
Ijarah Muntahia Bittamleek	Lease financing in the form of financing (capital lease) leases only
Quard Hassan	Benevolent loans offered interest free

It is evident from the table above, that Islamic banks offer a wide variety of services and products. In doing so, they compete strongly with commercial banks. The objective of this paper is to determine what factors influence university students to make the decision to switch from conventional banking to Islamic banking. The researchers aim to explore relevant literature, and provide a critique of the findings and link it to the outcome of this study. The outcome will not only be of interest to Muslims but also to the banking regulators and others in the UAE.

The remainder of this study is organised as follows. Section 2 presents relevant literature which evaluates the Islamic banking paradigm and assesses the underlying rationale for Islamic banking in Islam. Both the Islamic paradigm and the major products and services are analysed in terms of their practical implementation in the UAE and other national settings. Section 3 provides a description of the research methodology and data. Section 4 reports results of the survey findings and provides a detailed commentary on the outcome of the study. Finally, Section 5 concludes the study by reporting the main findings, limitations and avenues for future research.

Literature review and hypothesis development:

Consumers' choice of conventional banking: There is a sizeable literature on consumer choice with respect to banking preferences. More recent studies on this important are of research are briefly presented here. Hedayatnia & Eshghi (2011) examined the bank selection criteria being employed by

bank customers in Iran. They found that the important factors determining customers' choice of bank were quality of services and new banking methods, innovation and responsiveness of the bank, friendliness of staff and confidence in the manager, price and cost, staff attitudes and convenience of bank location and services. Mokhlis et al. (2011) examined the selection criteria used by university students for selecting a bank. Their results suggest that students appear to be very concerned about the security aspects, ATM service and financial benefits when selecting a bank. Locational convenience and recommendations from others were not given much importance. In another study, Aregbeyen (2011 investigated the determinants of banks selection criteria by banking and business customers in Nigeria. The study found that the safety of funds and the availability of technology-based services are the major reasons for customers' choice of banks. Katircioglu et al. (2011) examined bank selection criteria of customers in Romania. The most important factor in bank selection was found to be the number of ATM (automatic teller machines) booths. Other important factors were the availability of extensive ATM services, availability of telephone and internet banking, giving personal attention to customers, reputation and image of the banks, confidentiality of the bank for customer records, appearance of staff to be presentable and the number of branch offices around the country. Rumanian customers were not much interested in other factors such mass media advertisement, gifts provided by banks, fast and efficient service and recommendation by other people in their environment.

Consumers' choice of Islamic banking: Rashid & Hassan (2009) studied customers of Islamic banks to ascertain their bank selection criteria. They found that non-Islamic factors such as corporate efficiency, the availability of core-banking services, confidence, etc. were given higher weights by a majority of the respondents. Abduh & Omar (2012) investigated Islamic-bank selection criteria in Malaysia, with special reference to the region of the Klang-valley. They found that the Shariah-compliant attribute is the highest criterion for deciding to patronize an Islamic bank. Other important factors in Islamic bank selection are profitability, the bank's reputation, the bank's status, facilities and services, and the presence of friendly personnel. Subhani et al. (2012) studied bank selection criteria among customers in Karachi, Pakistan's financial hub. They identified ten factors including convenience, service quality, religious motivation, availability of ATMs, privacy and confidentiality, the bank's reputation and image, the existence of a variety of financing options, high bank profitability and low service charges, recommendations from friends and family, and the friendly and responsive attitude of the banking staff as primarily influencing the customer's choice in selecting an Islamic bank. The most important of these factors were high bank profitability and low service charges, followed by religious considerations and the quality of service.

In a 2012 paper using a mixed methodology, Echchabi & Olaniyi studied the preferences of Malaysian banks' customers for Islamic banking attributes. The quantitative approach consisted of the collection of primary data through a self-administered questionnaire distributed to 500 Islamic banks' customers in Malaysia. In parallel, a qualitative approach was used in the form of semi structured interviews with ten Islamic banks' customers. The results of both approaches were then reported accordingly. The quantitative approach revealed that the preference for Islamic banking attributes in Malaysia is a combination of the quality of services offered by the Islamic banks, as well as the convenience associated with it. On the other hand, the qualitative approach revealed that choosing Islamic banks was mainly due to the religious motivation of the customers. In another study, Al-Tamimi et al. (2009) investigated how bank customers in the UAE view Islamic banks versus conventional banks and whether this image affects customer loyalties or selection of a bank. Their study focused on five areas: bank image, bank products, service quality, cultural aspects and religious factors, in addition to demographic attributes of the sample. They found that most UAE bank customers prefer banking with Islamic banks, although they are not satisfied with the quality of products and services. Customers generally have a positive image of whatever bank they dealt. The most important factor in choosing a bank was bank products followed by service quality and then religious factors. Interesting enough, they found a significant difference between how customers perceive UAE Islamic banks versus conventional banks. In addition, they observed a significant difference in how customers perceived UAE Islamic banks based on their gender, education and duration of the relationship; and finally, there was a significant difference in how customers perceived UAE conventional banks based on their gender. In Bahrain, Buchari, Rafiki and Al

Kassab(2015) found that there are statistically significant differences in the awareness and attitudes of employees towards Islamic banks' products and services when they are grouped according to gender and education level while age and income both have insignificant differences.

The literature on attitudes, perceptions and knowledge of Islamic financial products and services in comparison with those conventional banks empirically had been analyzed extensively by Gait and Worthington (2008). Based on their review of the relevant literature, they found that religious conviction was a key factor in the use of Islamic products and services. The consumers also identified that bank reputation, service quality and pricing as being relevance to this matter. In another study on Islamic banking selection criteria from Bangladesh, Rashid et al. (2009) found that while religion was a critical factor in choosing Islamic banking, other factors also play a significant role in selecting a service provider. The study found that in addition to religion, factors like depositors' desire to achieve highest return, convenient financial transactions system, consistency in service with uniformity, and higher cost-benefit implications were substantially important to clients in choosing their intended services. Saini et al. (2011) studies the level of consumer awareness and use of Islamic banking products in South Africa in an attempt to understand what factors are important in the choice between Islamic or conventional banks. It was found that Muslims are aware of Islamic banks, but their rate of use is low, as Muslim customers regard efficiency, lower bank charges, the availability of automatic teller machines and an extensive branch network as important factors when it comes to choosing a bank, rather than religious motivations for compliance with Islamic conventions. The study concluded that, if Islamic banks wanted to attract and retain customers and remain relevant in the South African context, they would have to develop relevant strategies designed to meet customers' needs. Religion as the sole motivation for choosing Islamic banks is inadequate. Hamid & Masood (2011) examined the selection criteria of customers for Islamic home financing in Pakistan, focussing on gender, age, income, and occupation. Data were gathered from the customers of Islamic banking who use the services of Islamic home financing. Their results indicate that the Shariah principle, fast and efficient services, price, bank reputation, and terms and conditions of product flexibility are the five most important factors considered by customers in choosing Islamic mortgages.

In an earlier study, Erol & ElBdour (1989) examined some factors that customers use in choosing between conventional and Islamic banks. They concluded that in considering motives responsible for selecting Islamic banks as depository institutions, religious motives did not stand out as being the only significant ones. Bank customers were found to be profit-motivated. They also found that peer group influence plays an important role in selecting Islamic banks as depository institutions and there is a high degree of awareness on the part of bank customers of the advantage of the profit/loss sharing modes of investment and of the economic and social development role of the Islamic banking system.

A critique of the current Islamic banking practice

Researchers such as Lewis and Algaud (2001), Kuran (2004), Yousef (2004), and Iqbal and Molyneux (2005) also agree that the usage of PLS instruments such as Mudaraba and Musharaka financing has declined in recent years. Instead of PLS instruments, asset portfolios, short term financing and other debt based contracts constitute a great bulk of investments in Islamic bank accounts (Akbar, Shah and Kalmadi, 2012). Previous researchers (Siddiqui, 2002; Rosly and Bakar,2003a) highlighted that Islamic banks can hardly claim superiority over an interest based system. Khan (2004) argues that just because the products of Islamic and conventional banks are identical, it does not mean that Islamic products are impermissible. It is just one of the criticisms often used against Islamic banking practices. He argues that the majority of Islamic banking products have a strong resemblance to their conventional counterparts; however, what distinguishes Islamic instruments from conventional ones is nothing but a set of processes.

The above discussions have made us familiar with the relevant literature and the basic concept of the Islamic banking practices. The outcome of these discussions highlights the need to investigate user perceptions of the Islamic banking practices, which is explored through our empirical analysis.

Research Methodology

The study sample comprised of graduate and undergraduate students from a private higher educational institution in Abu Dhabi, United Arab Emirates. A total of 500 questionnaires were distributed in-person and through electronic survey, however, 388 respondents well-responded. The survey questionnaire items are measured via a five-point Likert scale. Both descriptive and inferential analysis are adopted to assess the demographic and independent variables. The instruments designed in nominal and interval scale where the average of respective three and five responses are calculated.

Findings and Discussion

Descriptive Analysis

Frequency of Demographic Profile

The demographic profile consists of age, religion, education level, occupation and nationality etc. Out of 388 respondents, there are 148 males and 219 females with a missing value of 21. Out of which, 13.7% of them are less than 20 years of age, 71.9% are in 20-25 years age category, while 9% and 3.1 % of the respondents are in age of 26-30 years, and 31-35 years respectively. 26.8% respondents were Emiratis and 70.1% were non-locals. Majority of the respondents (94.1%) were Muslims. For the occupational level, 147 respondents were currently working and had the experience of 1-5 years. Most of the respondents (81.2%) were registered in business major program at the University, and possessed college degree (153) and graduate degrees (178), and had fluent Arabic language skills.

Table 1: Demographic Profile

Respondent' age category	N	% of full sample
Less than 20 years	53	13.7
20 to 25 years	279	71.9
26 to 30 years	35	9.0
31 to 35 years	12	3.1
36 to 40 years	3	0.8
Missing values	6	1.5

Respondent' gender	N	% of full sample
Male	148	38.1
Female	219	56.4
Missing values	21	5.4

Respondent' highest level of education	N	% of full sample
High school	6	1.5
Some college	12	3.1
College degree	53	13.7
Graduate school	78	20.1
Missing values	21	5.4

Respondent' nationality	N	% of full sample
Emirati	104	26.8
Non-Emirati	272	70.1
Missing values	12	3.1

Respondent' religion	N	% of full sample
Islam	365	94.1
Other religion	13	3.4
Missing values	10	2.5

Respondent' major program of study	N	% of full sample
Business	315	81.2
Other program	57	14.7
Missing values	16	4.1

Respondents' Arabic language skills	N	% of full sample
Fluent	308	79.4
Somewhat fluent	29	7.5
Minimal	34	8.8
None	9	2.3
Missing values	8	2.1

Respondents' work experience in years	N	% of full sample
None	233	60.1
1 to 2 years	70	18.0
2 to 5 years	45	11.6
Over 5 years	32	8.2
Missing values	8	2.1

Respondents' willingness to learn more about IB	N	% of full sample
Yes	298	76.8
No	32	8.2
Not sure	49	12.6
Missing values	9	2.3

Respondents' opinion about where IB should be taught	N	% of full sample
High school	92	23.7
College	162	41.8
Graduate school	36	9.3
Private institutes	63	16.2
Other	25	6.4
Missing values	10	2.6

Table 2: Results of Familiarity with Islamic Banking

	N	% of full sample
Not at all familiar	121	31.2
Somewhat familiar	204	52.6
Very familiar	63	16.2
Total	388	100

How was respondents' familiarity with IB acquired?

	N	% of full sample	% of "familiar" sample
I have an account at an IB	121	31.2	45.3
A family member has an account with an IB	214	55.2	80.1
A friend has an account with an IB	153	39.4	57.3
The co. I work for has an account with an IB	31	8.0	11.6
The co. a family member works for has an account with an IB	72	18.6	27.0
The co. a friend works for has an account with an IB	71	18.3	26.6
I took one/more courses on IB	32	8.2	12.0
I learned about IB by talking to knowledgeable people	147	37.9	55.1
I learned about IB from newspapers, magazines, and social media	114	29.4	42.7
I learned about IB by other means	40	10.3	15.0

As found in descriptive data analysis, it shows the responses of 388 respondents on the familiarity of Islamic Banking products and services, probability of using Islamic Banking in 1-3 years in United Arab Emirates. Below are the highlighted responses:

1. 31.2% of the respondents were not all familiar with IB.
2. 52.6% of the respondents were somewhat familiar with IB.
3. 16.2% of the respondents were very much familiar with IB.
4. 31.2% had an Islamic Banking account.
5. 55.2% respondent’s family member had an account in IB.
6. 39.4% respondents reported that their friends have an account in IB.
7. 8.2% respondents took one/more courses in IB.
8. 37.9% respondents learned about IB by talking to knowledgeable people.
9. 29.4% learned about IB through print media and social media.

Table 3: Respondents knowledge about various Islamic Banking Products

IB Products	Mean	S.D.
Mudaraba	1.99	1.179
Murabaha	2.19	1.298
Musharaka	1.76	1.066
Baisalam	1.56	0.936
Istisna	1.52	0.881
Ijarah	1.74	1.091
Qard Hassan	1.95	1.252
Sukuk	2.32	1.37
Takaful	2.17	1.302

The above table exhibit that majority of the respondents have the satisfactory knowledge/ familiarity about the various Islamic banking products. Out of which respondents demonstrated better knowledge about Sukuk, Murabaha and Takaful IB products.

Table 4: Religious or secular factors that would influence respondents decision to switch to Islamic banking

Religious/ Secular Factors	Mean	S.D.
Customer service	4.28	0.906
Bank's financial stability	4.23	0.899
Bank's Reputation	4.15	0.968
Innovative products	3.87	0.974
Conformance with Islamic Principles	4.08	1.026
Bank's CSR policy	3.95	1.087
Respondents personal familiarity with IB	3.88	1.036
Profit sharing with customer	3.81	1.083
Bank's ability to survive in recession	4.08	1.01
Bank's location near home or work	3.517	1.214

Results indicate that superior customer service, reputation, ability to survive, geographical proximity, and personal familiarity with Islamic banking concepts do not have a significant influence on the decision to switch to Islamic banking. Expectations of financial security, social responsibility, advanced banking technology and Arab-language skills are significant factors. Interestingly, though, the single most significant factor influencing the decision to open an account at an Islamic bank was found to be expectations regarding the bank's conformance to Islamic principles.

Conclusion, Limitations and Scope for Future Researches

Students' awareness of Islamic Banking products and services shows that most of the respondents believe that Islamic banks' products and services are unique and have a sense of dealing with others. In addition, they believe that Islamic banking laws are derived from the Holy *Quran* and *Sunnah*. This concludes that more than 68.8% of respondents are aware of the Islamic banks products. Meanwhile, majority of the respondents (78.5) have positive attitudes towards Islamic banking products and services, are highly likely to open an account or continue with Islamic Banking. This finding has important implications for Islamic banks operating in a predominantly Islamic environment. By identifying the specific areas where financial product awareness may be lacking, the paper will assist educators, regulators and financial institutions to design financial planning courses in helping young consumers to achieve greater financial freedom. Some strategies may be considered to increase and promote awareness campaigns on the products offered by the Islamic banks. The banking and educational institutions also would find some ways to educate their customers and students about the Islamic banking thoroughly. Meanwhile, this study consists few limitations such as; (i) skewness of population that limit to the students of the selected University, thus the final result may not represent the population in this sector.The forthcoming researchers could perhaps add other factors of assessing the choice and preferences of students, while covering many UAE Universities as the sample of the study should be taken into account.

Note: We acknowledge the financial support provided by the Office of Research and Sponsored programs (ORSP), Abu Dhabi University to conduct this research.

Abstract

The article analyzes the personnel and the financial recourses for evaluating the efficiency of cluster performance. The paper identified the relationship between the number of employees engaged in research and development and the number of clusters as well as domestic spending on research and development and the number of clusters. Analytical method is used for the equation of the line showed a trend of the number of R&D employees, as well as an analysis of the percentage of internal expenditure on R & D to GDP.

Keywords: personnel recours, financial recours, R&D employees

Introduction

Currently, the urgent purposes of economic policy in both developed and developing countries are the growing of national competitiveness, expansion of the share of national companies in the domestic and international markets, increasing effectiveness of these companies.
At the same time, the management of competitiveness is becoming increasingly difficult due to the exhaustion of the capacity of a traditional industrial policy, which caused the development of technological and industrial specialization and cooperation within the framework of network structures - clusters.

Clusters "as points of growth" of the world economy

Cluster is a group of geographically adjacent, interconnected companies (suppliers, vendors, and others) and linked with them organizations.

World practice shows that in the past two decades, the process of cluster formation has been developed actively. In general, according to experts clustering covered about 50% of the economy of the leading countries of the world Table 1.

In modern Russia, the emergence of regional clusters was supported by State solution based on the current state of the innovation situation of the market. The reason for this were the scientific potential of certain region in promising scientific and technological areas, major research centers, university and factory (production) science. According to specialists, in Russia in 2013 26 pilot cluster initiatives were registered.

Cluster policy allows you to focus and intensify the resources to build an efficient economy in the country and the production of competitive high-tech products.

Table 1. The number of clusters in the leading countries (2013)

Country	The number of clusters
United Kingdom	168
Germany	32
Denmark	34
Italia	206
India	106
Netherlands	20
Untied States	380
France	96
Finland	9
Poland	61

Considering the active process of clusters formation, one of the key factors of the effective performance is social capital, as well as the internal costs on research and development in the leading countries which were mentioned above.

In the database of the world (Russia or any other country) official statistics there is no definition of cluster. This means that the "cluster" is not statistical units, i.e. Statistical Office do not assemble, form, and, therefore, do not analyze any data of clusters. It means that the "clusters" can not be measured, estimate, compared on the basis of available official statistics.

The paper examines the impact of the number of R&D employees, as well as domestic spending on research and development on the number of clusters in the leading countries. It is important because human and financial recourses are the most important factors in cluster system functioning.

Analysis of the personnel and the financial recourses of cluster

In paper the correlation analysis and direct relationship between the number of clusters and the number of R&D employees are found. Dependence on crowded average (0.68). Also in the paper we analyzed the dynamics of the number of R&D employees for 2004-2012 based on Eurostat data, which are presented in Table. 2.

Table 2. The number of R&D employees

Years	Germany	Italia	Netherlands	Poland	Finland	France	Russia
2004	…	255,535	122,801	127,356	76,687	424,588	839,338
2005	673,414	277,370	116,982	123,431	77,275	429,387	813,207
2006	…	306,088	121,531	121,283	79,911	452,924	807,066
2007	721,712	334,503	113,723	121,623	79,507	447,391	801,135
2008	…	353,367	117,372	119,682	79,289	471,975	761,252
2009	777,327	354,513	105,217	120,923	79,475	478,857	742,433
2010	…	348,215	127,154	129,792	79,979	523,648	736,540
2011	835,127	347,005	170,913	134,551	80,817	542,447	735,273
2012	…	364,315	185,287	139,653	79,372	564,527	727,263
The growth rate for the period, %		42,6	50,9	9,7	3,5	33,0	-13,4

… - no data

Calculate the growth rate for the period from 2004 to 2012 for all countries included in the study, positive dynamics is observed. Finland and Poland have no high growth rate in 2012 compared with 2004; Russia according to this indicator has negative growth.

Trend to increase (except Russia) by the number of R&D employees (Fig. 1) in the countries are revealed by graph line.

The graphs depicted Y - the numerical value of the index, the data presented in Table. 2, and calculate the equation of the trend. Making a prediction for 2013 and 2014 with a probability of 85% can be expected to increase the number of R&D employees, which can not be said about Russia.

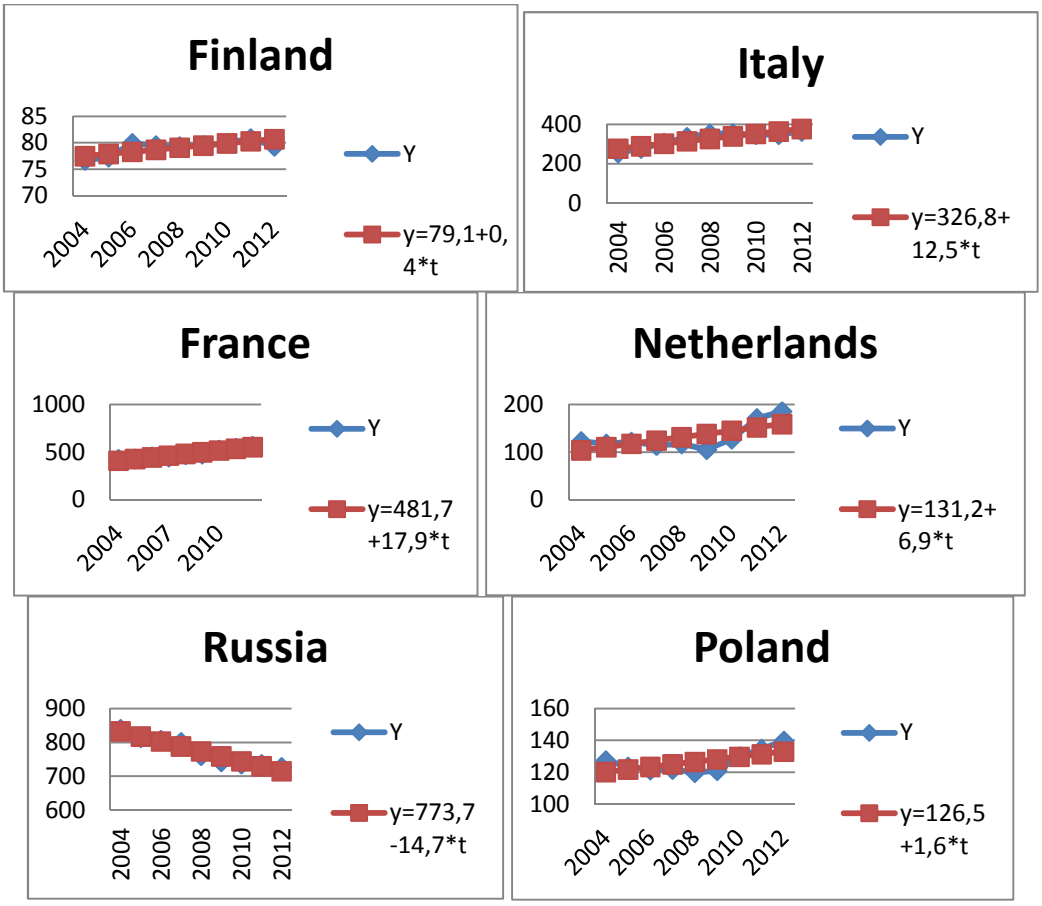

Fig. 1. Alignment of time series for the graph line in the countries.

As for the correlation analysis between the number of clusters and domestic spending on research and development, as well as staff engaged in research and development. Dependence on crowded average (0.68).

The main indicators of the financial resources of science are the costs of research and development, including the internal costs of the work performed by its own organization, and external costs for work performed under the contracts by third parties.

The OECD Frascati Manual (2002) defines gross domestic expenditure on R&D (GERD) activities as the total intramural expenditure on research and development performed on the national territory during a given period. This includes both current costs and capital expenditures. It includes R&D performed within a country and funded from abroad but excludes payments for R&D performed abroad.

The indicator is calculated by dividing gross domestic expenditure on R&D by GDP and expressed as a percentage. Both data on R&D expenditure and GDP can be expressed in current values and in the national currency.

The indicator provided is GERD (Gross domestic expenditure on R&D) as a percentage of GDP. "Research and experimental development (R&D) comprise creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society and the use of this stock of knowledge to devise new applications" (Frascati Manual, 2002 edition, § 63).

Table 3: Gross domestic expenditure on research and development
(Millions of US dollars, based on the parity of purchasing power parity of national currencies)

Country	1991	2000	2013
United Kingdom	18812,0	27891,8	39109,8
Germany	39430,6	52411,0	102238,4
Italia	12450,6	15266,7	26320,5
France	24293,9	33000,7	55351,9
United States of Amerika	161387,8	269513,0	453544,0
Russia	19991,3	10726,9	38829,5

The indicator does not show the proportion of expenditure on R&D which contributes specific ally to sustainable development. To date, most developed and a few developing countries are able to regularly collect and provide internationally comparable and timely data. This indicator is widely used to measure the so-called R&D intensity. However, it is not always the most appropriate indicator when measuring S&T in developing countries. Researchers as a percentage of population, labour force, or employment, might be more pertinent indicators, since they focus on human capacities and skills rather than on expenditure.

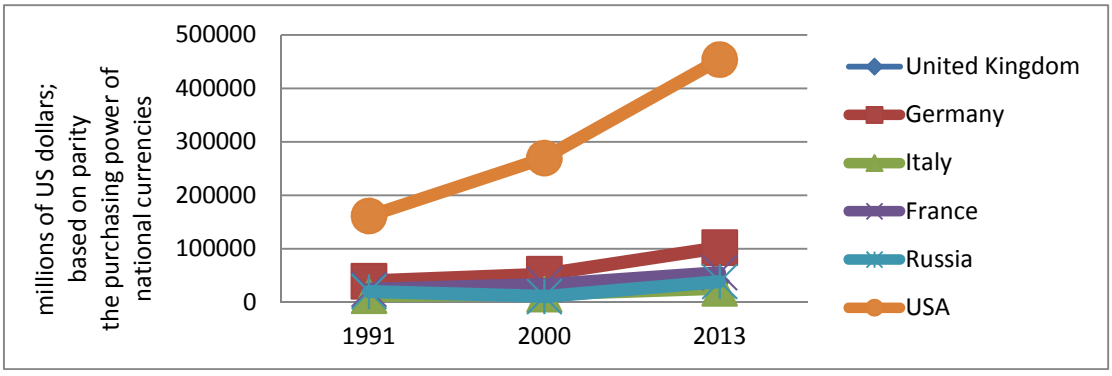

Fig. 2. Gross domestic expenditure on research and development

The graph shows that the US domestic expenditure on research and development in several times bigger than one of other countries, for Russia, in 2013 it was higher than the same one in Italy and almost reached the level of the UK.

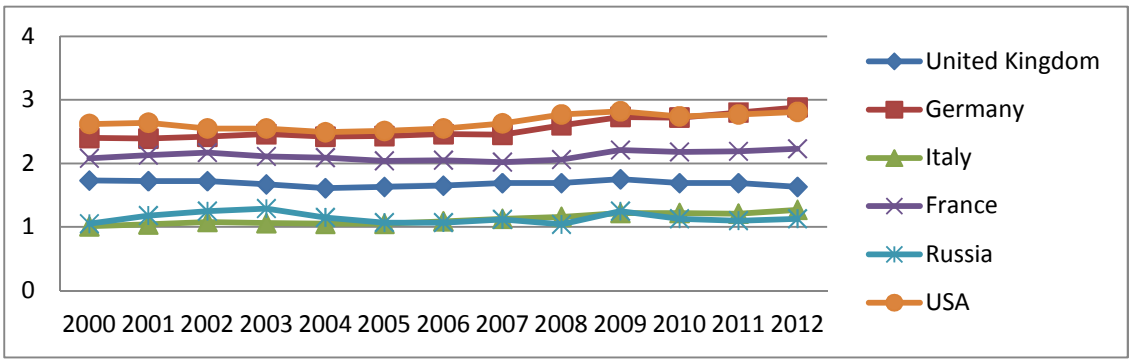

Fig 3. Gross domestic expenditure on R&D as % of GDP

The index of domestic spending on research and development in percent of GDP (Fig. 3) Russia lags behind countries such as the US, Germany, France.

Conclusion

Based on analysis, one can say that science is not a priority in Russia, considering the Russia's state policy of clusters, perhaps this is due to the reforms that have been taken place in the past decade. Implementing the cluster approach one cannot ignore the fact that economic success is possible beyond the clusters, and some companies may be more competitive than the clusters.

Abstract

This study aims to examine the effect of clarity of business vision and top management support on the quality of business intelligence systems at financial institutions in Medan City, North Sumatra, Indonesia. Survey conducted on 54 operational managers to gather information and to test the hypothesis of a study. Data was collected using questionnaires. The data analyzed with multiple regression analysis while hypothesis testing used was t-test. Results of this study shown that clarity of business vision and top management support have significant effects on the quality of business intelligence systems. However, the top management support has negative relationship with quality of business intelligence systems. The implication of this study is, in order to get better quality of business intelligence system top management should give socialization about business vision to subordinates and they should have a good technical skill on business intelligence systems.

Keyword: Business Vision, Top Management Support, Business Intelligence Systems

1. Introduction

Business intelligence systems are the subject of an extensive discussion in the literature (Olszak and Ziemba, 2012). The implementation of a business intelligence systems (BI) system is a complex undertaking requiring considerable resources (Yeoh and Koronios, 2010). Furthermore, the main purpose of business intelligence systems is to provide knowledge workers with tools and methodologies that allow them to make effective and timely decisions (Carlos, 2009). Moreover, Business Intelligence helps a company to create knowledge from that information to enable better decision-making and to convert those decisions into action (Chuck *et al.*, 2006). Whereas, benefits of business intelligence systems: improving business efficiency and productivity, enhancing business relationships, increasing business value, and the reduction of costs (Deepak, 2007). This study aimed to examine the effect of clarity of business vision and top management support on quality of business intelligence systems at financial institutions in Medan City, North Sumatera, Indonesia. Hence, the research question for this study is "do the clarity of business vision and top management support have an impact on quality of business intelligence systems?"

2. Literature Review

2.1. Clarity of Business Vision

According to Carpenter and Sanders (2007), vision is a simple statement or understanding of what the firm will be in the future. A vision for a firm is regarded as the ideal

future state of the total entity. It is a mental image of a possible and desirable state of the firm (Fitzroy and Hulbert, 2005). Furthermore, Hoque (2004) stated that an organization's vision statement provides the vision of what top management sees as the reason for the firm's existence. That is, it describes what the firm would like become. It is a description of ideal, and as such is a picture of the potential future, which it is, hoped employee, perhaps scattered around the world, can really round, understand, be committed to, and be motivated to help attain. Furthermore, Carpenter and Sanders (2007) state, statement of vision is forward looking and identifies the firm's desired long-term.

Based on some previous statement it can be concluded that business vision is a simple statement about the picture of the ideal state of the desired company in the future, be understood by all people in the company as well as their commitment and their motivation to achieve it.

Goal or vision clarity refers to the precision and detail of the objective (Lynn *et al.,* 2000). A clear vision provides the foundation for developing a comprehensive mission statement (David, 2011). Collin and Poras (1996) stated the critical point is that a vision articulates a view of a realistic, credible, attractive future for the organization, a condition that is better in some important ways than what now exists. According to Stacey (2011), the word 'vision' is usually taken to mean a picture of a future state for an organization, a mental image of a possible and desirable future that is realistic, credible and attractive. Fitzroy and Hulbert (2005) stated that a vision needs to be realistic, credible, and attractive and should provide a bridge from the present to the future. Furthermore, Madu (2013) explained that a realistic vision means should be relevant to organizational goal and achievable, credible vision mean having believed could lead to a better future while attractive vision to inspire and motivate everyone in the organization to implement that vision.

Dimensions of business vision used in this study are: realistic, credible, and attractive (Collin and Poras, 1996; Stacey, 2011; Fitzroy and Hulbert, 2005). Furthermore, indicators used to measure clarity of business vision in this study is relevant to organizational goal and achievable, having believed could lead to a better future, inspire and motivate everyone in the organization to implement that vision (Madu, 2013).

2.2. Top Management Support

According to Hussein *et al.* (2007), top management support is conceptualized as the involvement and participation of executive or level management of the organization in Information Technology (IT)/Information Systems (IS) activities. Kanter (1984) stated that management participation and involvement are the objectives; evidence supports the need to convince them why they should want MIS. Moreover, Zaied (2012) stated that management support refers to management approval and continuous support not only during the IS project implementation but also throughout the operational phase of the system.

Based on some previous statement it can be concluded that top management support is continuous support in the form participation and involvement of top management during information system activity. Dimensions of top management support used in this study are: participation and involvement (Hussein *et al.*, 2007; Zaied, 2012).

According to Compean and Higgins (1995), the management support is the extent to which assistance was available in terms of equipment selection, hardware difficulties, software difficulties and specialized instruction. Gottschal (1999) stated top management support measured by knowledge, expectation, participation, the time needed, enthusiasm, monitoring for the implementation. Nathan *et al.* (2004) stated that top management support of information system refers to the degree to which top management understand the importance of the IS function and the extent to which it is involved in IS activities. Ifinedo (2008) stated that top management support is the extent to which top managers in the organization provide direction, authority, and resources during and after the acquisitions of IT system. Weill (1992) stated that

support from top management facilitates many of the operational and strategic IT management activities. The activities include negotiation, IS planning, project management, and similar tasks. Zaied (2012) operated measurement of management support such as management encouragement, providing all necessary resources, discussing problems associated with the system, appreciating the optimal use of the system, and having sufficient knowledge of the system. Ifinedo (2008) stated top management support refers to the extent to which top managers in the organization provide direction, authority, and resources during and after the acquisitions of IT system. Khan *et al.* (2013) use 7 indicators to measure the top management support: 1. Top management involvement with IS function is strong, 2. Top management is interested in IS function, 3. Top management understands the importance of IS, 4. Top management supports the IS function, 5. Top management considers IS as a strategic resource, 6. Top management understands IS opportunities, and 7. Top management keeps the pressure on operating units to work with IS.

Indicators used to measure of management support in this study is: understand the importance of the IS function (Nathan *et al.*, 2004) and Khan *et al.* (2013), interested in IS function (Khan *et al.*, 2013), providing all necessary resources (Zaied, 2012) and (Ifinedo, 2008) provide direction (Ifinedo, 2008), involvement with IS function (Khan *et al.*, 2013) and monitoring of the implementation (Gottschal,1999).

2.3. Quality of Business Intelligence Systems

Sadikun, *et al.* (2016) stated that systems consist of many components, namely: hardware, brainwave, procedure, database, and software, the infrastructure of information technology, internal control and security measures and performance of system developer. Those things are interacted to build a synergy related one to each other. The Interactions among those arrangements are intended to support the organization. According to Gelinas and Dull (2008), business intelligence systems is the integration of statistical and analytical tools with decision support technologies to facilitate complex analyzes of the data warehouse by managers and decision makers. Laudon and Laudon (2012) stated that business intelligence systems is a contemporary term for data and software tools for organizing, analyzing, and providing access to data to help managers and other enterprises user makes more informed decision. ISs whose purpose is to glean from raw data relationships and trends that might help organizations compete better are called business intelligence systems (BI) systems (Effy Oz (2009). Turban and Volonino (2011) stated that business intelligence systems refer to a collection of ISs and technologies that support managerial decision-making or operational control by providing information on internal and external operations. Valacich and Schneider (2012) stated business intelligence systems can provide business decision makers with a wide variety of analyzes to support decision-making

Based on some previous statement it can be concluded that business intelligence systems system is a collection of ISs and technologies that support managerial decision-making or operational control by providing information on internal and external operations and help organizations compete better.

Adamala and Cidrin (2011) mentioned the most obvious first choice when trying to discover BI success factors is to look at information systems (IS) in general. Bailey and Pearson (1983) use dimensions: system access time, system flexibility, system integration and system response time. Srinivasan (1985) use dimensions: response time, system reliability, and ease of access. Todd (2005) stated, characteristics of a quality information system is reliability, flexibility, integration, accessibility and timeless. DeLone and McLean (2003) stated system quality refer to adaptability, availability, reliability, response time and usability. DeLone and McLean. (2008) explained that system quality-the desirable characteristics of an information system. For instance: ease of use, system flexibility, system reliability, and ease of learning, as well as system features of intuitiveness, sophistication, flexibility, and response time. Gorla *et al.* (2010) stated the indicators of system quality are flexibility and sophistication. Zaied (2012) explained

that measures of system quality typically focus on the performance characteristic of the system under study. In this work, the selected system quality elements are reliability, usability, adaptability, trust, and maintainability. Petter *et al.* (2013) stated that system quality considers the technical aspect of the system, including the convenience of access, system functionality, reliability, response time, sophistication, navigation ease, and flexibility among other. In this study, four indicators were used to measure of the quality of business intelligence systems system: flexibility, reliability, accessibility and integration.

3. Theoretical Framework and Hypotheses Development

3.1 The Clarity of Business Vision and Quality of Business Intelligence Systems

Clarity of vision or purpose refers to the accuracy and the detailed objectives Lynn *et al.* (2000). A clear vision provides the basis for developing a comprehensive mission statement (David, 2011). It is difficult to execute the strategy if the vision and mission are unclear or can not be understood, a company with a clear vision and mission and widely understood find it easier to make strategic decisions (Carpenter and Sanders, 2007).

Business intelligence systems are an information system that processes data about the internal and external operations are complex into useful information for managers in decision-making managerial or operational control more precisely so as to help organizations better compete. Adamala and Cidrin (2011) stated business intelligence systems are very closely tied to the strategic vision of the company. Yeoh and Koronois (2010) explained if the business vision is not fully understood, it will eventually affect the use and the results of business intelligence systems. As a business intelligence systems, initiatives drive business, so the business strategy vision is needed immediately for the implementation of business intelligence systems.

Some researchers have tested the effect of business vision on information systems or business intelligence systems. Yeoh *et al.* (2008) found evidence that business vision is an important factor that affects on the implementation of business intelligence systems. Ifinedo (2008) obtained evidence that when the implementation of enterprise resource planning system in accordance with the business vision, then the system success is high too. Yeoh and Koronios (2010) found evidence that the clarity of the business vision is an important factor that affects the implementation of business intelligence systems. Adamala and Cidrin (2011) stated that the business intelligence systems are closely linked to the company's strategic vision. Al-Busaidi and Lorne (2005) found evidence that the clarity of business vision associated with knowledge management system. Dawson and Van Belle (2013) found evidence that business vision is an important factor affecting the success of business intelligence systems.

3.2 Top Management Support and Quality of Business Intelligence Systems

The supports provided by the top management in the organization of information systems are very important in determining the success of all information system activities (Lucas, 1998; Raghunathan *et al*, 2004). Experience of successful organizations reveals that managerial involvement and broad and meaningful users are the main ingredients to improve the quality of information system performance (O'brien and Maracas, 2010).

Some researchers have tested the effect of top management support on information systems or business intelligence systems. Sharma and Yetton (2003) found evidence that top management support through task interdependence affects the successful implementation of information systems. Ragu-Nathan *et al.* (2004) found results that there is a relationship directly or indirectly between top management supports with information system performance. Yeoh *et al.* (2008) found evidence that top management support is an important factor that affects the successful implementation of business intelligence systems. Ifinedo (2008) obtained evidence that when top management support is high, the rate of successful implementation of enterprise resource

planning system too high. Yeoh and Koronios (2010) found evidence that top management support is an important factor that affects the successful implementation of business intelligence systems. Zaied (2012) stated that top management support plays an important role in improving the quality of information systems. Dawson and Van Belle (2013) found evidence that management support is a critical factor affecting the success of business intelligence systems.

However, the level of skills from top management is needed to use Business Intelligence tools were highlighted as key factor in hindering its use in organizations. (Hartley and Seymour, 2015)

Based on the description before, the framework of this study can be seen as follows:

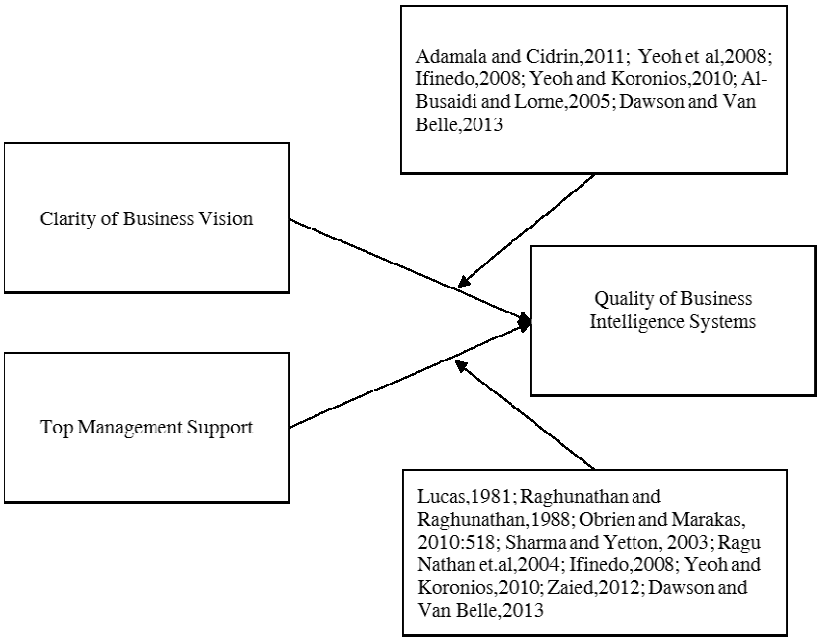

Figure 1: Theoretical Framework

Furthermore, the hypotheses proposed in this study are as follows:

1) Clarity of business vision have effects on quality of business intelligence systems.

2) Top management support have effects on quality of business intelligence system.

4. Methodology

This study uses explanatory survey method. The population in this study was financial institutions at Medan City, North Sumatera, Indonesia. The companies chosen in this study have been implementing business intelligence systems application. The participants of the study were operational managers. Eighty questionnaires were distributed to the numbers of the sample, 54 questionnaires were returned and used in the statistical analysis by using Statistical Product and Service Solutions. The instrument used for the collection data was a questionnaire. The questionnaire included 3 dimensions: clarity of business vision, top management support, and quality of business intelligence systems system. This study used a Likert five-point scale ranges from “strongly disagree” to “strongly agree” to examine participants responses to questionnaire statements. The questionnaires to be used previously tested for validity and reliability. Furthermore, the analysis method used multiple regression analysis, while

hypothesis testing used t-test. All analyzes were performed using the program Statistical Product and Service Solutions.

5. Finding and Conclusion

Before the data will be analyzed, all indicators in this study had been through test and the results were valid and reliable as it meets the criteria. Furthermore, the results of multiple regression analysis using as seen in the following table:

Table 1: Multiple Regressions analysis

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	8,409	2,267		3,709	,001
	Clarity of Business Vision	1,361	,310	1,518	4,394	,000
	Top Management Support	-1,654	,393	-1,455	-4,212	,000

Dependent Variable: Quality of Business Intelligence Systems

Based on the Table 1 we can concluded that multiple regressions equation as follow:

$$QBIS = 8{,}409 + 1{,}361\ CBV - 1{,}654\ TMS + e$$

The multiple regression equations above can explain the role of clarity of business vision and top management support on quality of business intelligence systems as seen from the magnitude of the regression coefficients. The above equation shows that the regression coefficient clarity of business vision is 1,361 and top management support is -1,654.

The result explained that more clear the business vision, the better quality of Intelligence systems. The impact from clarity of business vision on the quality of the business intelligence systems depends on how far management can realize the vision of the strategy in accordance with the conditions of the company. This supported by Adamala and Cidrin (2011) that stated business intelligence systems are very closely tied to the strategic vision of the company. As business intelligence systems are business driven, the vision of the business strategy is compulsory for the implementation of business intelligence systems (Yeoh and Koronois, 2010). Hence, results of this study supporting previous studies that stated clear business vision has an effect on implementation business intelligence systems, for instance research from Yeoh *et al.* (2008), Ifinedo (2008), Yeoh and Koronios (2010), Adamala and Cidrin (2011), and Dawson and Van Belle (2013).

On the other hand, the result of this study for top management support variable is contrary with most of previous research. Although the result is statistically significance, the sign showed negative value. It means that the less top management support, the better quality of business intelligence systems. Top management can demonstrate its support by providing the necessary resources and leadership, by setting goals and policies for Business Intelligence systems and showing interest by participating in business intelligence system design and development. Internal support including the availability of experienced Business Intelligence system staff, training opportunities and a network of supportive colleagues. Due to insufficient internal technical expertise, especially in developing countries, the availability and quality of top management support might be an important determinant of business intelligence system

effectiveness (Elbeltagi, McBride and Hardaker, 2005). This may explain this negative relationship between top management support and quality of business intelligence systems. When top management have a lack of knowledge in systems, it is better for them to less involve in implementing business intelligence system due to the might be make the process of implementation more complicated. As mentioned by Elbeltagi *et al* (2005) the developing countries including Indonesia the internal support have insufficient technical expertise.

Furthermore, to measure ability of model to explain effects of independent variables on dependent variable seen from the magnitude of the coefficient of determination as shown in the following table:

Table 2: Summary of Results

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,525	,275	,247	3,23551

The Table 2 above shows the value of R square is 0.275 means ability of independent variables in explaining dependent variable is 27,5%, on the other hand, 72,5% of independent variables described other variables that are not included in this study.

6. Conclusions and Implication

Generally, the current study has aided to develop groundwork for the study of Business Intelligence System implementation. More or less, the developed basis has generated some knowledge and arguments to organization stakeholders such as top management and Business Intelligence user to understand the factors that affecting Business Intelligence systems. From the findings of this research, it has found that factors such as top management support and clarity of business vision have significant relationship with Business Intelligence implementation. From employer's point of view, the significant effect of clarity business vision indicates that socialization from top management about business vision to subordinate is a crucial issue to successful of business intelligence system implementation.

In term of top management support, that should provide some indications to organization stakeholders who wish to expect the high quality business intelligence. The findings from this study indicate that the top management supports is negatively related to quality of business intelligence systems. That means Top management support is a barricade to those potential Business Intelligence Systems adopters. If that is the case, the result of this study suggested that when the technical skills from top management about business intelligence is low, more less their involve (giving support) on business intelligence systems implementation, the better quality of business intelligence systems. Vis-à-vis the organization intend to get better quality of business intelligence systems, it should make sure that top management has good technical skills on business intelligence systems.

Development of Accessible Educational Environment For Students with Special Needs

Olga Solodovnikova, Tomsk Polytechnic University, Tomsk, Russia, sol@tpu.ru
Galina Tsoy, Tomsk Polytechnic University, Tomsk, Russia, tsoy@tpu.ru

Abstract

In the modern world the accessible education for people with special needs is of high importance. Students with special needs get new ways to the educational roots; they can use variety of on-line services, but not always have a possibility to attend lessons personally. The authors of the article try to exam the existing situation at the Tomsk Polytechnic University.

Keywords: accessible educational environment, inclusive education, students with special needs, monitoring

Introduction

The development of the modern Russian educational system should take into account the principles of humanization and individualization. The new educational models, basing on these principles, include possibilities for different people to learn and to study together, independent from their physical and health statement. The modern situation shows some improvements in building of free educational space for especial students, the legal basis was already made, but there are a lot of questions which need solutions.

1. Creating accessible educational environment

1.1. Legal basis of accessible educational environment and tools for checking up

At the present time there are fixed requirements to the terms, conditions and results of university functioning in Russia. These requirements are specified in the Federal Law of the Russian Federation on Education N 273 and are evaluated by the following effectivity criteria: educational activities, science and research activities, international activities, financial activities, infrastructure, graduate employability, student body, staff and additional criteria for educational organizations (The Order of Federal Education and Science Supervision Agency).

The university is recognized effective if minimum 4 criteria are fulfilled (it means, the fixed indexes are reached). The effectivity of the university includes also criteria of implementing the high quality education for people with special needs. To make an assessment two main criteria are taken into account: developing of infrastructure for accessible environment (wheelchair ramps and elevators, access to the study rooms, personal working places for students with special needs etc.), teaching and learning aids for implementation of the educational activities for people with special needs.

1.2. Monitoring accessible educational environment

The whole educational activity of the university relates to the requirements of the Ministry of Education and Science for improving the educational environment, from enrollment campaign to graduate employability. 57 universities in 8 federal districts were inspected during the period of May, 12 to June, 10 in the year 2015. The monitoring purpose was to ascertain readiness and reliability of universities to enroll students with special needs into every educational form and level.

The monitoring criteria included the following:

- majors in educational forms and levels with enrolled students with special needs;
- list of adapted educational programs for disabled students and students with special needs,
- staff, able to work with disabled students and students with special needs;
- department, responsible for working with disabled students and students with special needs;
- accessible environment for students with different ICD codes from architectural point;
- teaching and learning aids for implementation of the educational and research activities for students with special needs;
- readiness of the university to use educational on-line technologies;
- system of graduate employability for students with special needs;
- etc.

2. The situation at the Tomsk Polytechnic University (TPU)

The Tomsk Polytechnic University (TPU) took part in monitoring procedure to estimate terms and conditions for implementation of educational activities for disabled students and students with special needs. The results of monitoring could serve for revision of existing educational system at the university and its readiness to implement adapted educational programs for students with special needs. TPU has already gained experience in educating such students – at the moment about 50 students with different ICD codes are studying.

The main monitoring results show that TPU is partly ready to implement educational programs for students with special needs. Speaking about partly readiness is first of all about intramural form, because extramural (distant) form is already implemented with taking into account students with special needs.

There are some urgent questions to be answered in the nearest time.
The university created the plan for developing accessible educational environment till 2020. The responsibilities of different departments were shared. Among the main directions of developing there are the next:

- to make one norm-methodical base for managing and implementation of inclusive education;
- to develop material and technical basis as well as teaching and learning aids for implementation of the educational and research activities for students with special needs;
- to modernize architectural environment for students with different ICD codes;
- to make a list of partner-enterprises with places for practices and employment for students with special needs.

2.1. Development of one norm-methodical basis and teaching and learning aids for implementation of the educational and research activities for students with special needs

To solve this problem it is necessary to collect specialists able to work in the sphere of inclusive education. The main requirement to these specialists includes experience in working with disabled people and people with special needs, especially for intramural educational forms. It is important to take into account not only stuff of TPU, but to use experience of other educational organizations, to work in net-form. It could help to gain experience quickly, to get interesting ideas and share our experience.

One norm-methodical basis can help to systemize existing experience of TPU and give the united requirements to the inclusive education at the university.

The next important step is stuff training for working with students with special needs.

2.2. Modernization of architectural environment for students with different ICD codes and development of material and technical basis

Among the most complicated questions there are the following ones:

1. University campus takes a broad area in the city center which is not tolerant to people with disabilities and special needs. There are not any special bus stops and equipped pedestrian zones; there are a lot of inaccessible areas like stairs on the way.
2. It is problematical to modernize historical study buildings and study rooms for inclusive education.

The problem of modernization of architectural infrastructure could be called the most difficult. Part of the university buildings has the statues of cultural heritage. It means, it is not allowed to bring some changes into the building construction.

To start solving the problem TPU made the list of "new" buildings without statues of cultural heritage. This list of buildings and study rooms was made from the point of being ready to modernization in the shortest time and with minimal volume of constructing and funding.

The next parameters were taken into account:

- Way and difficulty of moving from the public transport stops and roads to the buildings;
- Acceptance of the building to the sanitary standards (having a ramp or possibility to construct it, accordance of doors and corridors; possibility of using the multimedia equipment or possibility of installation of such equipment; possibility of fixing the extra toilet rooms for people with special needs etc.)

But solving this problem of modernization of architectural infrastructure depends on the city authorities, because TPU is located in the historical city center. The problem solving includes such questions as: converting the pedestrian zones, fixing the information boards, modernization of public transport stops, converting the system of traffic control and installing the special traffic lights, making parking places for transport of disabled people etc.

2.3. Partner-enterprises with places for practices and employment for students with special needs

This problem cannot be solved isolated from the society. At the moment the system of interaction between the university and enterprise is under reconstruction. It brings to complications in finding places for practices and employment for students with special needs. It should be legally ordered, that the enterprise should make working places for students and graduates with special needs.

Now there is a dilemma: the university should give possibilities for inclusive education, but enterprises are not motivated to take students with special needs for practices and graduates with special needs for work. The only one exception is some enterprises which traditionally use as workers people with disabilities. But it makes the way to inclusive education not consecutive, because inclusive education should give people with special needs equal chances with other people.

Conclusion

In conclusion we can constant that TPU is implementing the accessible educational environment for people with special needs. There are some steps done and problematical field was drawn up. This way is

not easy, it is necessary to combine efforts of authorities, enterprises, stuff, students to make successful system of inclusive education.

Systematic Development of Ontology-Based Decision Support System for Solving Emergency Incidents

Martina Husáková, Faculty of Informatics and Management, University of Hradec Králové, Hradec Králové, Czech Republic, martina.husakova.2@uhk.cz

Abstract

Emergency incidents endangering human lives require fast and faultless decision making. Rescuers have to deal with various, often hardly predictable situations. These situations can be effectively solved on the basis of the complex knowledge that is received during education and emergency missions. Complex knowledge can be represented by the formal ontologies that are suitable for machine-processing. The main aim of the paper is to propose systematic approach for building of the OWL ontology-based decision support system that recommends suitable strategy for provision of the immediate first-aid. Preliminary phases of the systematic approach are practically demonstrated.

Keywords: Ontology, Emergency Management, First Aid, Concept Mapping.

Introduction

Emergency management is a multi-disciplinary area applying science, decision-making, planning and technology for dealing with potential or actual threats able to negatively influence human lives. Efficient decision-making (often under uncertainty and time limits) is inevitable for sustaining quality of lives. The paper investigates the potential of ontologies – the information and knowledge-based structures that could offer "knowledge platform" for decision-making during emergency incidents. The paper proposes the conceptual framework for building ontology-based decision support system for the assistance during the provision of the first aid. Non-professional rescuers are a primary target group because they have a problem to decide which step in which order have to be done in case of seriously injured person. The proposed decision support system is going to be used as an education tool or advisor during provision of the first aid. The preliminary steps in building ontology-based application are practically demonstrated in the paper. The paper is structured as follows. The section 2 introduces ontologies in the context of the emergency management. The section 3 proposes the conceptual framework for building ontology-based decision support system. The preliminary phases of the conceptual framework are explained and their content is practically demonstrated in the section 4. The paper mentions future directions and conclusion in the section 5.

Ontologies in Emergency Management

Ontologies are knowledge-based schemas able to represent knowledge for their sharing, reuse and problem solving. Ontologies play the role of the vocabularies of "things" with the meanings that can be used by intelligent agents as a knowledge base for problem solving and communication with other intelligent agents. Decision-making often requires the usage of diverse information or knowledge sources that can be spatially distributed. Ontologies are able to represent relations between knowledge coming from these various resources and to offer detailed and complex view on the application domain. Emergency management is the managerial activity highly dependent on efficient, fast and reliable problem solving and decision-making where the aim is to minimise vulnerability to hazards and cope with disasters (Iaem, 2007). Literature review shows that formal ontologies can offer one of the paths how to deal with complexity of problems solved during emergency incidents. The authors of the paper (Javed, et al., 2011) proposes the usage of the OWL ontologies for improving shared situation awareness among teams of rescuers during emergency situations. Described conceptual framework is practically demonstrated on the case study of the mass evacuation in the tsunami event. Han, Y. and Xu, W. introduces the five-layer framework-based decision support

system that is applied for solving crisis emergency situations (Han and Xu, 2015). Practical usage of the framework is demonstrated with Tianjin port explosion case study. The paper (Fan and Zlatanova, 2011) is aimed at the ontology-based solution for resolving semantic heterogeneity of data in case of emergency responses. The authors of the paper explain how to build the ontology for the needs of the emergency management. Emergency situation ontological model (ES_Ontology) is introduced in (Shan, et al., 2012). ES_Ontology is a conceptual schema for solving semantic conflicts and inconsistent problems occurring during particular emergency situations. The ontology is based on the upper-level ontology - ABC ontology defining fundamental concepts providing basic building blocks for domain-specific metadata vocabularies (Lagoze and Hunter, 2001). ES_Ontology offers semantics understanding of the emergent situations for prediction of future emergent events. Practical usage of this ontology is presented in the Fukushima nuclear radiation event. The ABC ontology (i. e. eABC ontology for the emergency management) is also extended in the paper (Cui, 2015) by the concepts from the coal production application domain. The coal mine emergency case ontology model provides a solution for solving problems during knowledge sharing and semantic conflicts in the coal mine emergency field. The paper (Cech, et al., 2011) focuses on designing general schema for decision support in response operations during biological (biochemical) incidents. Combination of ontologies, expert systems and their inference abilities, are the core of the schema.

Provision of the first aid is the activity that should belong to the fundamental ability of each person. Giving the first aid requires fast reactions, decisiveness depending on specialised body of knowledge, experience, and the ability to apply them during critical and often stressful events. Knowledge is often unstructured and fragmented in various resources in case of the first aid. Decision making during provision of the first aid often depends on the context. As the example, Gordon manoeuvre cannot be applied for all situations. Its usage depends on the state of the basic life functions of the human. Ontologies are knowledge structures that can be used for context modelling (Krummenacher and Strang, 2007). They are able to represent knowledge formally and in a structured way. These are the reasons why the ontologies are deeply investigated in the context of the first aid conceptualisation.

Systematic Approach for Ontology-Based Decision Support System Development

It is inevitable to apply systematic approach for modelling complex knowledge, not only in case of ontological modelling. The proposed conceptual framework is composed of activities (phases) that are systematically ordered according to the priorities, see fig. 1. The other parts of the framework (tools, content) are dependent on the particular needs of the intended software solution. These parts are mentioned in the context of the investigated application domain – giving the first aid in case of this paper.

The knowledge acquisition is the first phase of the conceptual framework, because it has to be obvious which part of the reality is going to be represented in the ontology. Concept maps are knowledge representation schemas that are used for analysis of the application domain (Novak, 1990). Concept maps are then used for the ontology building. If the aim is to only develop the taxonomy of ontology without the inference, the expression of semantics of ontological classes or rules integration are not necessary. Consistency of the ontology has to be checked for the prevention against the occurrence of the logical discrepancies. Syntactic and semantic correctness of the inference rules has to be also tested because of the occurrence of an undesirable advice. The software solution has to be tested also during the instance data integration because of the incorrect “communication” with the application as a whole.

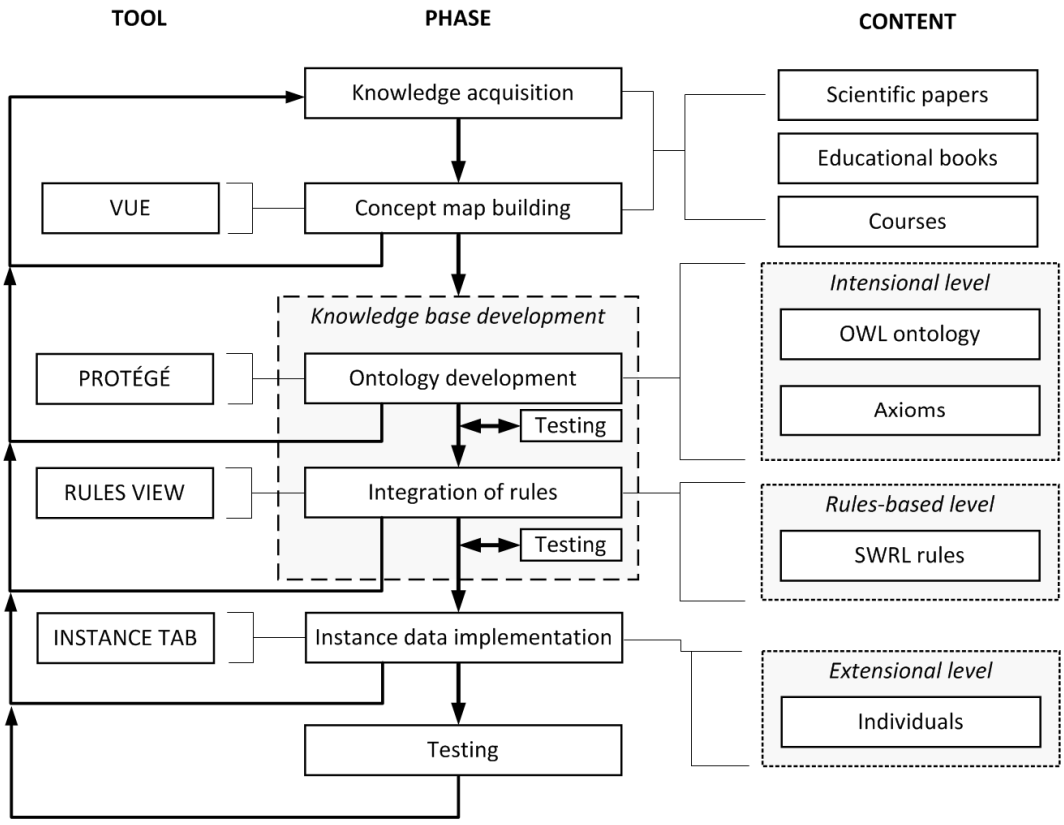

Fig. 1: Conceptual framework for ontology-based decision support system development

Preliminary Phases of OWL Ontology Building

Knowledge Acquisition

Provision of the first aid is critical activity consisting of many interrelated operations. Non-professional rescuer encounters a lot of diverse facts relating with the first aid. It is very difficult to distinguish which step has to be applied as the first and what have to be done after that. (C-)ABCDE is a treatment procedure that systematically solves emergency events requiring the first aid (Thim, et al., 2012). The algorithm consists of six phases in the extended version. The first phase (C - Catastrophic Haemorrhage Control) is focused on the control of the haemorrhage. If the haemorrhage is external it can be detected and controlled. The stopping bleeding has the highest priority because loss of blood can cause the occurrence of the shock or death. If the blood stream is under control, it is necessary to check the state of the air passages (A – Airway). If the air passages are free, but injured person cannot breath insufficiently, the artificial respiration is applied (B – Breathing). The fourth phase is focused on monitoring of the blood circulation (C – Circulation). The blood circulation is evaluated on the basis on the indirect signs – state of the consciousness, breath and hearthbeat. The fifth phase (D – Disability) is aimed at checking the level of consciousness (a level of neurologic state). It is obvious that this characteristic is often monitored during each of the previous states. The final phase Environment (E) is the secondary examination where the global examination is applied.

Concept Mapping

Each phase of the (C-)ABCDE algorithm consists of series of partial steps (decisions) that has to be done. This is the reason why the systematic approach has to be applied also for the conceptualisation

of the first aid. Systemic approach is based on the concept maps that visualise key concepts (relations) related to the each phase of the (C-)ABCDE algorithm. The backbone of the whole concept map is depicted with the VUE (Visual Understanding Environment) tool, see fig. 2 (see bold concepts and relations). The backbone of the concept map has been substantially extended on the basis of the knowledge acquisition phase. If all concepts and relations would be included into the only one concept map, the concept map would be very complex and probably useless. The four concept maps have been developed. Each one is focused on the conceptualisation of the only one characteristic that has to be monitored by a rescuer: consciousness, haemorrhage, breathing and blood circulation. Fig. 2 depicts only one of them – unconsciousness (see the concept in the grey scale).

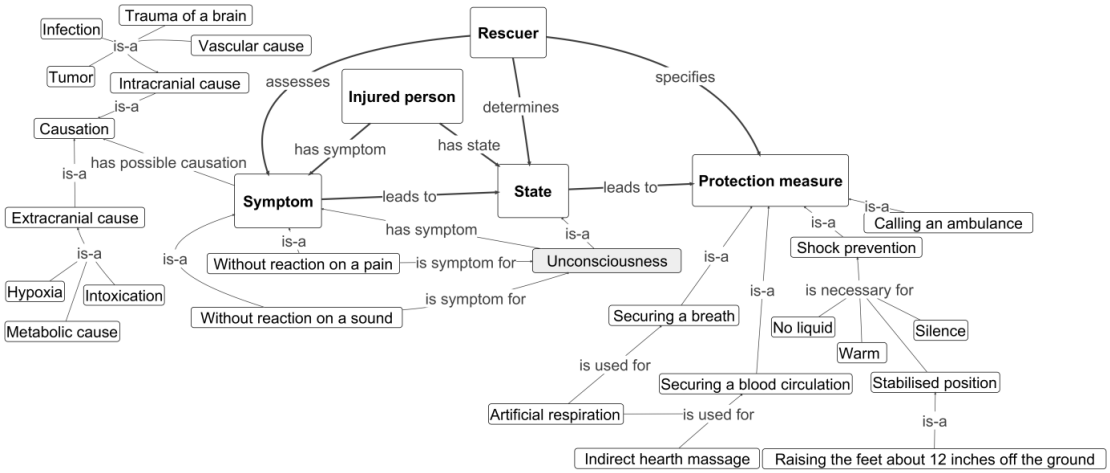

Fig. 2: Backbone of the concept map and its extension (Unconsciousness)

Future Directions and Conclusion

The paper proposes systematic approach for building ontology-based decision support system in the field of the emergency management – for provision of the first aid. Giving somebody the first aid requires complex knowledge that is often fragmented in different knowledge sources and expressed in unstructured format that is not easily managed by a computer. Preliminary phases of the ontology-based decision support system have been already completed. The four developed conceptual maps (labouring under (C-)ABCDE algorithm) are going to be used for the knowledge base development, i. e. for the identification of the fundamental ontological concepts (ontological classes and object (datatype) properties). The ontological concepts are going to be integrated into the OWL ontology with the ontological editor Protégé 4. Pellet is going to be applied for checking consistency of the OWL ontology. SWRL rules will propose particular recommendation on the basis of the actual state of the injured person. Actual state will be represented by individuals of the OWL ontology. It is known that the Protégé ontology editor is not used for building and usage of the fully-fledged decision-support system (e. g. expert system). On the other hand, the Protégé can help to demonstrate which technologies can work together and can be used for building more sophisticated semantics-based application, e. g. with the assistance of the Jena framework or OWL API.

Intangible Assets, Economic Models and Neural Network

Eugenia Iancu, Stefan cel Mare University, Faculty of Economics and Public Administration, Suceava, Romania, eiancu@seap.usv.ro
Gabriela-Liliana Cioban, Stefan cel Mare University, Faculty of Economics and Public Administration, Suceava, Romania, gabrielac@seap.usv.ro

Abstract

In the knowledge society, learning and knowledge have become key factors of success internationally and intangible resources are of vital importance. This topic is addressed by us by the prospect of consequences induced by the current global crisis and bearing in mind that resource called "knowledge" has become a driver of global competition. In other words we propose estimating the risk of bankruptcy by recourse to techniques of Artificial Intelligence (AI) and inclusion in the model of estimation of what we call intangible assets of the company. Part of the work is expected to provide some answers / clarifications both on using AI techniques for predicting the risk of bankruptcy of companies and on the assumption of including intangible assets of a company in the equation given by economic models Altman, Conan-Holder for predicting the risk of bankruptcy of the companies. It is difficult to say succinctly, we believe, what is knowledge and which of financial accounting indicators better reflect the share of this "active" in the value it has at one time a certain company. In other words, we believe that our research topic is one of interest in what we call the knowledge economy / society, since knowledge condition today in an increasingly way progress and prosperity of countries / companies

Keywords: intangible assets, business models, neural network, multilayer perceptron, concessions, patents, licenses

Introduction

Analysis of the path taken by a firm during its existence has been and remains a major topic of study in microeconomic theory and management. This is because the progress and prosperity of a country remains dependent on microeconomic realities, namely the success or failure of entrepreneurs in an economy based on market mechanism. Statistics on the number of bankruptcies of companies, GDP growth, unemployment or other similar indicators show that some business organizations are able to consolidate its position in the marketplace at a time when other business organizations are obliged to withdraw from the market or go bankrupt. Certain questions arise such as: How do you explain this current situation encountered in the business world? To what extent can or cannot be predicted the bankruptcy of a firm? What is the support offered by computer to substantiate decisions taken by top management?

Both the '29 -'33 Great Depression and the 2008 global crisis show, we believe, that relatively tortuous national economies evolve over time; Economic growth has become a better individual in theory and leads to the conclusion that periods of progress / prosperity are followed by recession or economic crisis. From a microeconomic perspective, it is widely accepted idea that each company follows a certain cycle itself and that similar to economic dynamics, macroeconomic firms face period less favorable or more restrictive (on turnover, market share, profit , dividends etc).

In the context of exponential evolution of the Internet and computer networks, major changes have occurred, we believe, on the management applied by firms and the types of resources that underpin innovation, new products and market success. In particular what we call knowledge has become an essential resource for innovative activities within firms and competitive position that these organizations have at some point in markets where they locate. Especially in the corporate world it was found that the market value of a company came to depend increasingly on the volume of knowledge it holds that organization and less of its tangible assets (this becomes evident during acquisitions, mergers, reorganisations etc.).

There are some economic models on predicting the risk of bankruptcy of a company and based on their various groups and organizations they have established their own tools to assess the health of a company. There are especially known economic models such as Altman and Conan-Holder which have been and remain the basis of models applied by commercial banks in the ordinary procedure which these entities apply in relation to various categories of customers (commercial banks have their own tools to assess / determine the creditworthiness of a customer, the risk accompanied by placing a credit, etc).

In the context of pronounced socio-economic instability, as the release of the Romanian economy from 2009 to the present, the market value of held by a company at a time tends to move in contradictory ways (especially for listed companies, reliability and the structure of social capital highly influence the exchange of shares). The struggle between competing firms moved from the plan of tangible resources (capital, raw materials, land, machinery and equipment etc.) to intangible resources plan, in which elements such as knowledge and ability to use them (knowledge management) have a crucial role . Knowledge became the basic resource of companies, the way they manage to obtain power, prestige and wealth in the economy and in modern society. The generation, acquisition and use of knowledge are extremely important for economic development.

Literature review

In our opinion, the problem of estimating the bankruptcy risk of a company remains one of major interest on microeconomic theory and the business organizations (whether or not the use of AI techniques to solve this problem).

The original version of the Altman model proposed in 1968 is as follows (Altman, 1968, p. 594):

$$Z = .012X_1 + .014X_2 + .033X_3 + .006X_4 + .999X_5 \quad [1]$$

Z = Overall Index
X_1 = Working capital/Total assets
X_2 = Retained Earnings/Total assets
X_3 = Earnings before interest and taxes/Total assets
X_4 = Market value equity/Book value of total debt
X_5= Sales/Total assets

According to the model proposed by Altman the original weighting coefficients of the 5 variables can be weighted in turn by 100, in which case the score function of the model is as follows (Iancu, 2011):

$$Z = 1.2X_1 + 1.4X_2 + 3.3X_3 + 0.6X_4 + X_5 \quad [2]$$

Using Conan-Holder model, as scope and interest in financial world and stock market in different countries, did not remove significantly move away from the path of the Altman model during which I had Altman model.

The general form of the function score on which the Conan-Holder model is based (Conan-Holder, 1979) approaches in form and structure of the score function of the Altman model; but the weighting coefficients and variables of each structure are different; general form of the function score is as follows (Guizani, 2014 pp.22):

$$\mathbf{Z = 0,24*X_1 + 0,22* X_2 + 0,16X_3 - 0,87* X_4 - 0,1* X_5} \quad \mathbf{[3]}$$

where:

X_1 = gross operating surplus / total debt
X_2 = Permanent capital / total assets
X_3 = (Current Assets - Inventories) / total assets
X_4 = Financial Expenses / turnover
X_5 = personnel expenses / added value

Another model is the score function developed by the Central Bank Balances France (CBBF), model which has seen development / adaptation over time; in the initial version there were analyzed 19 indicators for accountability and a large number of companies (some of them have gone bankrupt or have had a difficult situation and some of them had a normal situation or have thrived).

Scoring method included a total of eight distinct installments for indicators of accounting and certain weights to each installment (note that the working principle enunciated by Altman in the subject of economics is in all models and tools for predicting bankruptcy).

According to estimates given by different authors based on scoring method applied in this case is the following function score (Galesne 1995, pp.76-82):

$$100\ Z = -85{,}544 - 1{,}255X_1 + 2{,}003X_2 - 0{,}824X_3 + 5{,}221X_4 - 0{,}689X_5 - 1{,}164X_6 + 0{,}706X_7 + 1{,}408X_8 \quad [4]$$

where:

R_1 – gross exploitation result/ total debt - indicates own debt of financing capacity;
R_2 – Total equity / total liabilities - indicates patrimonial solvency;
R_3 – Cash and investments / total assets - quantifies the performance of the assets;
R_4 – Financial expenses / turnover - indicates the level of financial charges
R_5 – Staff costs / value added - shows the degree of remuneration of staff;
R_6 – equity / total assets;
R_7 – gross operating result / total assets;
R_8 – The need for working capital / turnover

Among the first models to estimate the risk of bankruptcy in our country was that of Camasoiu Negoescu which is based on an analysis of financial indicators analyzed during 1993-1994 in seven state-owned companies. Score function of this model is the following (Negoescu, 2003, pp.103-107)

$$z = \frac{\sum k_i \cdot R_i}{100 \cdot \sum k_i} \quad [5]$$

where:

k_i are weighting coefficients that have values:3,6,4,3,6,3,3,5,5,5;
R_i rates obtained from reporting on certain indicators taken into account.

Later, Gheorghe Băileşteanu, starting from models Altman, Argenti, Conan and Holder, proposed in 1998 for Romanian companies a model of four installments which comprises the following structure: G1 - general liquidity, G2 - solvency, G3 – client recovery and G4 – cost effectiveness (Anghel., 2002, pp.89-90); the four installments are:

G1 = current assets / current liabilities
G2 = solvency = (net profit + depreciation) / (credit + interest rate reimbursed)
G3 = recovery clients = turnover / customers
G4 = cost-effectiveness = profit / cost x100
The score function associated to these rates is:

$$B = 0{,}444\ G_1 + 0{,}909\ G_2 + 0{,}0526\ G_3 + 0{,}0333\ G_4 + 1{,}414 \quad [6]$$

Ion Anghel proposes in 2002 a model using a sample of 276 economic entities in 12 branches of the national economy. These entities were chosen at random for each economic entity there have been processed accounting information in the 1994-1998 period based on data from the annual accounts. They used a total of 20 indicators grouped into five groups of users as follows: activity, liquidity, indebtedness, profitability and other information. Finally they were detained four installments (Anghel, 2002, pp.139-152):

X1 = Net Income / Revenue - represents revenue performance

X2 = Cash Flow - debt coverage ratio of cash flow;

X3 = Debt / Assets - asset leverage;

X4 = (Liabilities / Sales) * 360 - the period for payment of obligations

The score function associated with this model is:

$$A = 5,676 + 6,3718\ X_1 + 5,3932\ X_2 - 5,1427X_3 - 0,0105\ X_4 \quad [7]$$

Artificial neural networks, also called connectionist systems appear as a smart solution of last resort, where other methods of computer assistance are difficult to apply due to the poor structuring of the decision-making problem. These so called connectionist models were considered by some researchers as "direct competitors" to traditional models (Russell, 2003 pp.25). What can neural networks do today? A concise answer is difficult to give because there are so many activities in so many subfields that it is hard to say. From the point of view of our research we mentioned that Expert Systems (Iancu, 2011) and Neural Network are suitable for assessing the risk of bankruptcy of a firm by appealing to models Altman, Conan-Holder etc (it is difficult to say which of the two tools would be appropriate to Economic resolve this issue, some opinions on this subject will result implicit in our study of applied research). Operation of neural networks is based on two fundamental concepts:

- Parallel operation of multiple independent processors of information (we discuss further network Multilayer Perceptron itself a distinct processor or J48 it to be used as a "control key" for the results obtained Neural Network);

- The existence of a law of learning that allows these processors to adapt to the specifics of a given informational context.

The neural network (NN) for time series prediction shows univariate general working principle for solving economic problems (Figure 1).

Figure 1. Neural network for time series prediction univariate

The dependent variable subject for prediction may be different to independent variables, but both are a function of time.

• Neural network for time series prediction multivariable

Multivariate prediction involves predicting the output of dependent variable x and the prediction of independent variables y, z at the time t + 1 based on their previous values. In this case, the prediction of the variables y and z can be performed with univariate prediction neural network (it is used a network of networks function of the number of existing variables).

Predictions for 2014 based on NN and the past for the two firms

As resulted from the applied research carried out by us until this moment (values in accounting firms, the previous tables, data clustered / grouped) we had reliable data only until 2013 inclusive. Theoretically, any of the two types of NN used by us can support decision-maker to make predictions for at least one year for each company that is studying BCF (Business Cycle of the Firm), predicting the risk of bankruptcy and foreshadowing the desired / possible future for that organization.

Unlike the ES, when using NN it is possible that the software itself to be likely to provide a prediction of the phenomenon analyzed, prediction resulted from a mathematical extrapolation of the trend from the past (Iancu, 2011).

This prediction of NN is to be interpreted by human experts and who featuring other information will be able to intuit the foreseeable future of the company.

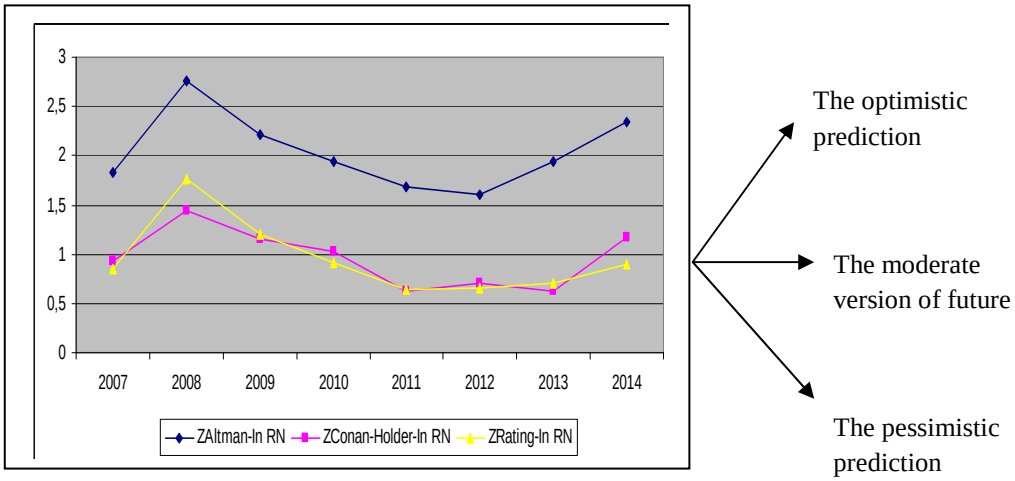
Figure 3: Data derived from the 3 economic models of prediction for BCC (Business Cycle of the Company)

In figure 3 we present data resulted for Company A, during 2007-2014, these data being the base for predicting bankruptcy score for 2014 (among other matters we remember: rates resulted in ES (Expert Systems) for each economic model were taken into account; it was calculated an average for the years considered, determining the average rate, we included in the analysis the RIn rate of intangible assets, intermediate scores calculated by NN, etc). In the same annex we include similar data for Company A except that we focus our attention only on the first set of data.



Source: by author based on data from www.bvb.ro

Figure 4. BCC versions prediction for human decision-maker (Company B)

Based on data from Figure 3, we present only the graph offered by NN for the Company B for 2014 (Fig. 4). This figure includes the three directions in which the decision maker studying the path followed by this company can direct its predictions.

Conclusions

As shown in the issues raised by us on the basis of actual data that define the course of the two companies studied, it must be concluded that the intangible assets of a company has become in recent decades increasingly important / significant in the route followed by the organization over time. This is because the market value of any firm is given in an increasingly matter by the ability / skill of employees, the innovative capacity, the stock of knowledge available to it (infer implicit that human decision maker must take account of intangible assets in an attempt to foreshadow the future of a company). Simply put, the higher decision maker within the Company B (due to the use of ES and NN applications based on intangible assets without such intangible in the structure of the three economic models) will have three distinct directions on the future of the organization:

a) Where an optimistic variant is chosen on the BCF for the next 2-3 years the human decision-maker must take into account the values offered by NN for 2014 and in addition to carefully analyze the market situation and the socio-economic conjuncture at a time;

b) In the context of socio-economic instability of the business environment in Romania, including the pharmaceutical industry seems to be recommended a moderate variant of predicting BCF (it is the result of an intuitive average calculated by decider by aggregating the three graphs in Figure 4);

Finally, if the domestic situation regarding cash flow, previous investments in technology, its market position and similar issues lead to relatively negative conclusions, the human decision-maker may consider a pessimistic variant of prediction for the BCF for the following 2-3 years.

Abstract

Problem of the research is mapping the social context and identifying how a set of determining socio-cultural factors determine managerial solutions in favour of transectorial dimension of strategic philanthropy? What socio-cultural factors play the most important role in transectorial managerial decisions in different parts of the world? Is strategic philanthropy, as a constituent of CSR, equally acknowledged across the global business community? Main findings of this research reveal a correlation between multiple factors of the social environment, stemming from its cultural context, and managers' philanthropic choices, related to strategic objectives of organizations and society. A theoretical framework for managerial decisions in favour of transectorial strategic philanthropy, developed through this research suggests a set of solutions, capable to evaluate the strength of each factor and to mitigate the influence of the negative ones. This framework proposes new possible avenues for research of relationships between business and society, moving managers and decision makers beyond the intrinsic assessment of cost benefit ratio of the overall company revenue and encourages scholars to further investigate how transectorial managerial decisions- which can be justly taken for strategic philanthropy- contribute to the betterment of society and at the same time ensure sustainable development of the company itself.

Keywords: socio-cultural context; transectorial strategic philanthropy; corporate social responsibility; managerial decisions; transectorial philanthropic decisions

Introduction

Relevance of the research

The global challenges of today make a strong pressure on companies to shift from formal declaration of corporate social responsibility to intrinsic and factual application of its values, with adequate responses to strategic needs of societies in which they operate. This means systematic change in business collaboration with other sectors, such as social security, social welfare, research and education. Throughout decades the dichotomy of society and business has by default been viewed as antagonistic, however, philanthropic initiatives, as a constituent of CSR strategy, are embraced by enhancing numbers of top management. These managerial choices seem to vary according to the capabilities and propensities of the players involved and are at large determined by the cultural context, in which they operate. This article presents an overview of the development of academic thought in the field with the focus on different socio-cultural contexts as determining factors for multifaceted relations between business and society. The

authors introduce a theoretical framework for CSR companies and their managers, which can facilitate transectorial philanthropic decisions.

The discourse of corporate philanthropy was evoked by the academia of social sciences long before signing the famous UN Global Compact, which delineated the main universal principles organizations should abide to in order to be considered socially responsible. Since then, empirics continue to debate the universal dimension of these principles (Wood, 1991; Amaeshi et al., 2006; Athanasopoulou & Selsky, 2015; etc.), stating that they are neither unique nor universal in their meaning and rather depend on given cultural or organizational context and are operationalized through the political and symbolic processes of that context. Conceptual research classifies three dimensions of the social context: individual, organizational and external (environmental) (Athanasopoulou & Selsky, 2015). We maintain that these three dimensions in reality intermingle, and through managerial decisions manifest themselves in specific empirical macro-organizational phenomena, depending on the social context in which they operate (Vveinhardt & Zygmantaite, 2015a).

Empirical investigation proves the fact that the giant global companies and international firms, having installed most instruments for CRP (corporate social performance) in their operating and internal regulating documents and practices (Bruch & Walter, 2005; Strand, 2012; Kania et al., 2014; Grancay, 2014; etc.), make the pillar of the global CSR community. At the same time SMEs, operating at international, regional and local levels usually need a stronger push for taking additional obligations in the sense of their dues for the development of societies (Amaeshi et al., 2006; Jamali et al., 2009). Taking Carroll's (1991) four-folded pyramid of CSR as the datum line for this investigation, we contradict some critics of this approach as proposing the hierarchy of values within the concept and suggesting that economic component of the CSR construct is the most important or highly valued domain (Reidenbach & Robin, 1991; Ameshi et al., 2006). We argue that the discretionary (philanthropic) category is the manifestation of the ultimate responsibility and correlation between company's performance and the society. Focusing on the socio- cultural dimension of the corporate strategic philanthropy, we propose, that transectorial managerial decisions are required for companies not to confine their philanthropy to the cases of cause-related marketing, and get involved into strategic philanthropy.

The aim of this research is to map the social context of business operation from the cultural perspective as it is presented in the scholarly depository in the field, to conduct a comparative analysis with the perspective what vectors for empirical investigation in the socio-cultural context of post-soviet economies could be created which could culminate in creating a frame for managerial choices, leading to transectorial managerial decisions.

The objectives of the research are: (1) to conduct a comparative analysis of the scholarly findings up to date, focusing on the social context of CSR organizations and its impact of on managerial decisions in favour of transectorial philanthropic activities; (2) to map the domain of cultural context, with the aim of identifying a set of strongest factors; (3) to design a theoretical frame for managerial decisions in favour of transectorial strategic philanthropy.

Limitations of research.

This research focuses exclusively on theoretical analysis of the problem, without involving into empirical study of specific cultural environment and social context.

Methods of research:

analysis and synthesis of scientific literature, analysis of secondary data, content analysis.

1. Comparative analysis of the scholarly findings up to date, focusing on the social context of CSR organizations and its impact of on managerial decisions in favour of transectorial philanthropic activities

Reflections on Strategic philanthropy: predominant cause related marketing perspective

Until recently the predominant cause-related marketing perspective appeared to be sufficient for defining company strategic philanthropic performance (Vveinhardt & Zygmantaite, 2015a). Company philanthropy, as a tool for cause- related marketing is neither peccant, nor idle, because it's most sophisticated cases, as stated by Porter and Kramer (2002) can improve the reputation of a company by linking its identity with the admired qualities of a chosen non-profit partner or a popular cause. However, the confusion in terminology and the concept of strategic philanthropy has reached unimaginable heights of *omnium-gatherum* since Friedman's (1970) observation in New York that „few phrases are as overused and poorly defined as "strategic philanthropy." Thus it is necessary to specify the boundaries of the term and its application: if it is "strategic", it has to be identifiable and synergistic with the company's mission, goals and objectives, become a part of the company's code and culture (Post & Waddock, 1995; Fombrun et al., 2000; Vveinhardt & Andriukaitiene, 2014; etc.). However, to outreach cause-related marketing, it must embed strong philanthropic vector and transcend the boundaries of the sphere of company's activity. In other words, to be strategic, the philanthropy must possess transectorial dimension, because, according to Porter and Kramer (2002) "true strategic giving, addresses important social and economic goals simultaneously, targeting areas of competitive context where the company and society both benefit".

The importance of socio-cultural context in strategic philanthropy

The construct of corporate social responsibility stems from company's relations with society's institutions and nature's ecosystems (Frederick, 1997) thus the role of management studies is to describe, analyse and evaluate these complex societal and ecological linkages (p. 48). In his earlier studies he defined two perspectives in which businesses tackle their societal obligations, i.e. CSR as a philosophic-ethical dimension, arguing that "business corporations have an obligation to work for social betterment" (Frederick, 1994, p. 151), and its empirical side, as a summation of tools and instruments, which companies should apply in trying to respond to the pressure, placed on them by the social environment. The main variables in the discourse of strategic philanthropy being of three-folded nature – socio-cultural, individual and that of the organization,- not only individual values of top managers and other decision makers, but factors of social context in particular (Wood, 1991; Athanasopoulou & Selsky, 2015; etc.) come into play. This perspective emphasizes the important role which social context plays in companies' choice for strategic philanthropy in communication with society as the most significant stakeholder. Though, as stated by Johnson (1987) until recently, social context was treated by most scholars "as a background noise" and not as a central constituent of the problem, nowadays many researchers admit the important role, which social context plays in companies' choice for strategic philanthropy in communication with society as the most significant stakeholder (Granovetter, 1985; Porter & Kramer, 2002; Streuter et al., 2005; Jamali et al., 2009; Hansen, 2010; Athanasopoulou & Selsky, 2015; etc.). However, the field for the studies of socio-cultural context is extremely broad and diverse, thus consequently it is essential to specify the boundaries and vectors for its classification.

Although the analysis of the scientific literature and empirical research data suggest a wide range of classifications of companies, in this study we focus on the typology, where socio-cultural context, as specific determinant criterion is distinguished. Thus the size and scope (multinational companies, giant firms with international branches, SME's functioning nationally, locally or regionally); location (country, region), political system and economic structure of the company's operation, the level of its economic

development, as investigated by scholars were in the focus of our investigation. Specific historical factors were taken into consideration as well.

2. Mapping the domain of cultural context

Determinant factors: political- economic structure of the country

One of the main variables for studies of companies' involvement in CSR, as stated above, being the socio-cultural context, more researchers engage in studies of specific socio-cultural environment of the organizations, which in one way or another determine their attitude towards corporate social responsibility. However, the researches focus exclusively on the construct of CSR or corporate citizenship without specific emphasis on strategic philanthropy, or in many cases treating the concepts synonymously.

Main differences can be traced in the scholarly works between companies, operating in Western type of democracies (Jenkins, 2004; Strand, 2012; Kania et al., 2014; etc.) and the context of the developing countries (Amaeshi et al., 2006; Jamali et al., 2009; etc.). Though the processes of globalization amalgamate company's performance in the broad sense, when registered in one continent, the company may operate in another, recruit employees from the third and have impact on the fourth, giant companies and their branches, operating in different countries, apply diverse methods and operating regulations. According to Langlois and Schlegelmilch (1990) even the codes of ethics of e.g. USA, European and Latin American (Grancay 2014) organizations differ strikingly, referring to the specific cultural context. According to Grancay (2014), even airlines, which operate globally, apply different customer- service rules and terminology, due to the different cultural context and corporate cultures of their home-country. From the perspective of the Western type democracies, organizational studies are unimaginable from the holistic sustainable development approach, which, according to Streuter and Martinuzzi (2005) is a well-known societal guiding model that asks for integration of economic, social and environmental issues in all societal spheres and levels in the short and long term. Western societies have sufficient instruments to control firms' performance, thus to ignore this social pressure, according to Granovetter (1985) would be simply a misunderstanding.

After 1990's transformational processes in Europe, new democracies appeared, thus entirely different and complicated socio-cultural context emerged on the spotlight of researchers, with its peculiarities, conditioned by many-folded economical heritage and experiences, which still lack in depth analysis. Although separate cases of CSR application are available in the academic domain (Mazurkiewicz & Crown, 2005; Elms, 2006; Kooskora, 2006; Apostol et al., 2008; Navickas & Kontautiene, 2011; etc.), the majority of them don't reflect the local perspective and are not an outcome of local societal expectations but, rather, are brought from abroad and introduced to the local community (Apostol et al., 2008). In addition, their perspectives reflect an overall situation of the existing domain of the CSR in transforming economies of Europe and its limitations. The content of CSR concept, as it is understood in industrial countries of Western democracies may sound as the celestial choir in countries with deep gaps between societal groups (Vveinhardt & Zygmantaite, 2015a). Prakash and Potoski (2011) maintain that firms' CR portfolio and its beneficiaries' is likely to vary across industries, time, and institutional and cultural contexts.

Promoting strategic philanthropy in the strong economies as the best model for company-society relations, where the benefit for both sides is guaranteed, Porter and Kramer (2002) concentrate on the competitive social context, where they distinguish four elements: factor conditions, demand conditions, context for the strategy and rivalry, related and supporting industries. Some of these elements may be directly associated with strategic philanthropy, as, for example, supporting education in the field of their business, companies invest in long-term targets, related to the benefit not only for company, but for society as well.

Determining factors: different socio-cultural context for global companies and international firms.

Differences in the size and scope of companies is one of the determining factors for company's resolution to engage in strategic philanthropy. Most giant companies and international corporations have specific positions for CSR in place in their administration and governing structures, usually with strong mandate for decision making (Strand, 2012). Apart from accounting for abiding to the legal and environmental laws and regulations of the country of operation, they focus on transmitting the positive message about the organization and its performance to the external and internal stakeholder community (Porter & Karmer, 2002; Strand, 2012; Kani et al., 2014; etc.). Companies, like Cisco Systems, Apple, Safeco, Rockfeller, Carlsberg, ABB, Alstom Power Service, Lufthansa, Hilti, RWE, Tata Steel and Unaxis and many others are directly involved in community programmes in their own countries, aimed at transectorial collaboration and development of societies (Porter & Kramer, 2002; Sandfort, 2008; Porter & Kramer, 2011; Strand, 2012; Kani et al., 2014; Liket & Maas, 2015; etc.). However, according to Bruch and Walter (2005), "although the relevance of corporate philanthropy is widely accepted, few companies achieve significant, lasting societal impact because most lack a cohesive strategy. Effective philanthropy must be run no less professionally than the core business (Bruch & Walter, 2005). On the other hand, although the sores of society were in focus of companies in the last century, and many of them have played essential roles in identifying social problems, such as poor education and limited public communication, and developing viable solutions for them, supporting larger social movements in civil rights, children's rights, and environmentalism (Sandfort, 2008; Foster et al., 2008; etc.), the peculiarity of the present day businesses' investments in strategic philanthropy is the focus being shifted towards the sphere of the "opulence", i.e. support for art, culture, historical heritage, sports, ecology of the body, NGO's etc., as opposed to the still existing needs in developing countries (Ameshi et al., 2006; Prakash & Potoski, 2011; etc).

While operating in underdeveloped countries, many giant companies invest in community programmes, such as education, self-governing structures, creating networks of local NGO's (Ameshi et al., 2006; Visser, 2008; Jamali et al., 2009; Prakash & Potoski, 2011; etc.), and thus social context of underdeveloped countries is the determining factor of such company's "overseas" philanthropic activities, which can be classified as strategic, i.e. aimed at long-term targets, related to development of societies, and not usual cause-related marketing (Vveinhardt & Zygmantaite, 2015a). Namely in such countries global companies' investments don't conclude with image and sales related donations, they transcend the boundaries of the company's sphere of activity and are the outcome of transectorial decisions of the company's management. However, such type of strategic philanthropic initiatives, when oriented not to local societal needs, but to the benefits of other countries, even though important in company's economic goals, contribute to the target country's strategic development, not those of the company itself and of its home country (Ameshi et al., 2006; Jamali et al., 2009; Prakash & Potoski, 2011; Vveinhardt & Zygmantaite, 2015a; etc.).

Determining factors: the size of a company.

Global business statistics shows, that 99 % of worlds business is small and medium enterprises; respectively EU Annual Report on European SMEs 2013/2014 states, that more than 20 million SMEs in the EU represent 99% of businesses, and are a key driver for economic growth, innovation, employment and social integration (European Commission, 2015a, 2015b). However their perspective on strategic philanthropy scarcely investigated, as philanthropy is traditionally attributed to the sphere of the rich, the big and the famous, hence the exceptional focus of most researchers on giant companies or brand names (Bruch & Walter, 2005; MacKenzie et al., 2011; Liket & Maas, 2015; etc.). Strategic philanthropy of SME's, operating nationally, regionally or locally, though can make biggest impact on communities and on the betterment of society, are excluded of scholarly research focus, otherwise the concept of CSR is used synonymously with any "doing good". On the other hand, smaller companies argue, that due to their size and insufficient recourses, they can't afford investing in social projects, however, many of them

benefit from social funds, while participating in social programmes for creating new jobs or employing people with different kinds of physical or social disadvantage, they benefit from tax reduction, different grants etc.

Most researches of CSR in the sector of SMEs agree that that the nature of doing business in SMEs is largely personal and argue that the embeddedness of the business within its stakeholder community plays a large part in shaping socially responsible behaviour (Granovetter, 1985; Fuller & Tian, 2006; Jamali et al., 2009; etc.). This perspective is peculiarly relevant to enterprises, operating on the regional or local level, because, according to Fuller and Tian (2006) their legitimacy with immediate stakeholders, employees, customers, suppliers, and their local community is at stake in a far more direct and personal way than it is with major corporations.

Due to their often very personal relations with local community members through family or school relations, not only negative managerial situations, such as nepotism, cronyism, and favouritism in organizations are evident (Vveinhardt & Zygmantaite, 2015b). This also relates to the sphere of positive acts of direct responsibility to the local communities, as, according to Murillo and Lozano (2006) interpersonal and personal relationships are very important in the context of SMEs.

However, the imperative of local communities doesn't always affect philanthropic deeds of companies, as they uphold the view of contributing to social development through the system of taxation. Thus, their philanthropic engagement is usually unrelated to their core activities, is mainly oriented to gaining a better position within their competitive environment, and they are merely attempting to translate positive reputation effects into concrete bottom-line impacts (Bruch & Walter, 2005).

Determining factors: religious orientation and traditional socio-cultural heritage

A strong determining socio-cultural factor for a company's involvement in CSR in the developing countries is their size and regional political and religious orientation. In such countries, peculiar relational attributes of SME's owners and managers to the local communities is dominant (Vives, 2005; Amaeshi et al., 2006; Jamali et al., 2009; Prakach & Potoski, 2011; etc.). In countries with Islamic roots local SME's owners and managers tend to identify themselves and their core business as an integral part of the local community, thus the obligations towards the community prevail over economic goals (Jamali et al., 2009). Communal obligations are treated as part of their religious duties, while any CSR related activity in their understanding is purely philanthropic. According to Griffin and Prakash (2013), if firms' philanthropic activities in such countries are determined by the institutional and cultural context, tithing and charitable activities aligned with religious beliefs are often considered expressions of corporate obligations and duties to others. Contrary to Western type structured and assessed (strategic) philanthropy, in countries, where religious obligations as part of the traditional socio-cultural heritage dominate, they are the driving factor for any philanthropy deed. At the same time these activities are usually not advertised, not structured; they are rather hidden, and the companies often unknowingly act in a socially responsible way (Amaeshi et al., 2006; Jamali et al., 2009) Philanthropy is therefore conceived "within the moral economy of kin-based solidarity and reciprocity" (Amaeshi et al., 2006). However, the predominant feature of such economies is high level of corruption and on the whole insufficiently developed regulating tools and control mechanisms to evaluate company's performance in regards to its congruity with legal, environmental and ethical the CSR principles.

Determining factors: specific context of post-soviet economies.

The overview of socio-cultural context as a determining contributor to the managerial decisions, related to strategic philanthropy or the absence of this type of activities in company's agenda in post-soviet economies is based on the recent researches (Elms, 2006; Kooskora, 2006; Apostol et al., 2008; etc.) as well as data analysis available on the website of unglobalcompact.org and the Lithuanian Association of

Socially Responsible Business (2015). The researches of the CSR domain with specific focus on the transforming economies of the Eastern Europe, though increasing in scope and thematises, hardly make up the leeway, deepening with each year due to the speed, with which they are catching up with the rest economies of the wealthier EU old-timers. However, regardless the rapid changes in the GNP and living standards of these countries, the specific socio-cultural context, in which businesses operate in this EU region, is at large determined by the heritage of more than 50 years of the so called "planned economy". The connotation of this construct, while arising certain economic allusions to Western scholars in the field, differs enormously from the real socio-cultural content it evokes for any citizen of such societies, hence the businesses in particular. Taken by countries and geographical regions, the socio-economic factors reveal rather striking differences of development in such fields as fighting corruption, unemployment, emigration, demographical figures etc. However, there are numerous factors, terms and conditions for businesses to operate, which draw these economies into one line. What is peculiar to the context of the post-communist countries in general, is that corporate social responsibility is rather new and emerging idea, which is not clearly defined or understood (Mazurkiewicz & Crown, 2005; Elms, 2006; Apostol et al., 2008; etc.).

According to the data of unglobalcompact.org, in 2015 only 71 companies, registered in Lithuania, are members of UN Global Compact. 10 of them hold membership since 2005, with 6 -8 new members on the average joining the organization each year. The composition of this small group of global and national actors from perspective of size and the sphere of activity is rather diverse, ranging from universities and branches of global companies, to SMEs and micro firms (EU SME and micro firm definition, March 2015). Lithuanian Association of Socially Responsible Business (LAVA), established in 2013, has only 34 members, with just half of which being private equity companies, and most having joined the organization not earlier than 2011-2012. The discourse on CSR and strategic philanthropy in Lithuania is still rather virgin land in organization and management researchers. Strategic philanthropy lacks relevant respect from the businesses, hence it is not in the spotlight of scholarly and empirical researchers either. After 25 years of functioning as an independent country and a member of the EU since 2004, Lithuania has all respective laws and regulations in place, thus the first three constituents of the CSR concept, which fall into the field of governmental regulations, are more or less in compliance with societal issues. Moreover, present day companies tend to redound to society and its needs, however, in the sphere of any companies' giving, traditional cause-related marketing cases prevail This evidence is supported by the yet thin theoretical reasoning and empirical research data available (Navickas & Kontautiene, 2011; Diskiene & Seiliute, 2014; etc.) A research on the Lithuanian enterprises performance in connection to their application of CSR reveals, that philanthropic activities of most Lithuanian enterprises are determined by corporate policies, culture and other factors, and not by increase in revenue, (Navickas & Kontautiene, 2011). Hence, the set of determining factors of socio-cultural context in which businesses operate in Lithuania still needs to be identified and is a matter of further investigation. The main emphasis lays on the socio-cultural factors' in correlation with the individual and organizational values and their embeddedness in managerial decisions on macro-societal level, "for companies do not function in isolation from society around them" (Porter & Kramer, 2002). Up to date, the investigations in modern socio- cultural context don't provide vectors, suitable for investigations in business society relations. According to Granovetter (1985), most behavior is closely embedded in networks of interpersonal relation, thus in local communities, where smaller companies operate, the network of natural societal structures, such as charity, volunteers' and local communities, local clubs and circles, etc., usually act as strong moral watch-dogs. However, this network being demolished during the soviet occupation and fighting its way back to the social life in the broad sense, Lithuania though a small country, has no community traditions, peculiar to either Scandinavian type of communities, no community kinship, which determines CSR activities in countries with strong religious influence. Although the principles of citizenship are strong within Lithuanian society, and donating and charity activities are speeding in application among citizens and firms, these are not systematic, planned or structured activities, aimed at long-term strategic synergistic targets of companies. Investigation of the construct of strategic philanthropy, its tendencies and correlation with socio-cultural context in Lithuania should focus on

SMEs, as the structure of business in this country shows, that 99.8% of enterprises are SMEs and micro firms.

Nowadays nobody would deny the importance of top managers' and owners'/shareholders' position in decision making and their influence on macro-organizational processes (Vveinhardt & Zygmantaite, 2015a), in particular those related to transforming the company into a socially responsible one *de facto*. According to Bruch and Walter (2005), most managers and executives in favour of philanthropy maintain, that a company's level of giving is all that matters, rather than its level of strategic engagement with philanthropic activities. Thus, even though the empirical evidence shows, that top managers lack systematic approach to strategic philanthropy, there are no relevant researches in this area. In other words, the area of cognitive managerial perspective on CSR and strategic philanthropy, and their response to social pressures (positive and negative), still needs to be explored.

3. Designing a theoretical frame for managerial decisions in favour of transectorial strategic philanthropy

Since the concept of "society" is embedded in the roots of CSR construct, there are no stages of the CSR "pyramid" in which society has no interest in the broad perspective, as society is the most important stakeholder of every business. Sandfort (2008) maintains, that although private, institutional philanthropy can be an engine of significant social change, however, due to the low level of SME involvement, this potential is not brought into play as it should. To be socially responsible *de facto*, organizations have to undergo the process of organizational learning, which according to Zadek (2004) consists of several stages. Zadek's perspective on corporate social responsibility initiatives relates to larger changes in organizational learning, in other words, with strategic changes in the organization itself. He distinguishes five transformational stages, related to implementation CSR strategies in organization, transmuting its performance from defensive reaction to a responsible citizen: (1) defensive; the organization denies its responsibility for societal shortcomings and only acts to defend reputational attacks; (2) compliance; the company sees CSR activities only in the context of protecting its reputation, reducing the risk of litigation and the cost of doing business; (3) managerial, responsible business practices become embedded into core management processes; (4) strategic; being socially responsible is viewed as a competitive advantage and is integrated into core business strategies; and (5) civil; the organization becomes an advocate for CSR in the broader marketplace. Bruch and Walter (2005) produced a classification of companies' approaches to corporate philanthropic activities, consisting of four types: peripheral philanthropy, constricted philanthropy, dispersed philanthropy and strategic philanthropy. They stress the importance of strategic philanthropy as the most efficient type, pointing substantial benefits from such activities to both, company, stakeholders and society on the whole. Foster et al. (2009) maintain, that depending on motivation, response to social context and with regard to community goals of philanthropic initiatives, companies can be classified into donors, sponsors, and partners, the latter being closest to strategic philanthropy and transectorial decisions, as "partner companies accept a collective responsibility to improve society by leveraging their organization's key competencies and resources to develop a philanthropic agenda that contributes to broad, positive social outcomes".

Several frameworks to promote implementation of CSR are on offer in the scientific literature, most of them oriented towards the SME sector. Grayson (2006) acknowledged the importance of small companies' role for CSR and created a "Seven Step Model for Corporate Social Opportunity". He stresses the important role top managers/owners play in taking decision in favour of CSR. His model suggests a seven-stage process to implement and evaluate engagement in CSR and its measuring its performance: business case; evaluation of the company's resources; investigation and identification of motives for social responsibility commitment; committing to social responsibility; strategizing CSR; recognition and engagement of stakeholders; measurement and reporting (Grayson, 2006). We suggest the model can be adapted to put forward managerial consideration for strategic philanthropy and transectorial philanthropic decisions. It is essential to keystone the society, as the most important stakeholder and to synergize the

strategic goals of the organization with those of the society. Most researchers acknowledge that financial resources are the determining agent in decisions for or against the managerial decisions in favour or against strategic philanthropy. In the majority of cases the choice is related to the individual context, no less than the shareholders'. In this context Kurucz et al. (2008) concentrate their focus on company's choices for CSR as a means to reduce costs and risks to the firm. They present a business case for CSR, putting forward four hypotheses, each of which can be translated into social, environmental and economic values: including: the trade-off hypothesis, the available funds hypothesis or slack resources theory, and enlightened value maximization.

In 2009 Jenkins adapted Grayson and Hodges (2004) big company CSR opportunity model and created "A 'business opportunity' model of corporate social responsibility for small and medium-sized enterprises", where he described steps, an organisation should take for embracing the opportunities, CSR offers for an SME. A strong potential in store of the SMEs towards transectorial managerial decisions is manifested through the results of his research, because the managers "cited ethical or moral reasons as the key driver for undertaking environmental or social initiatives" (Jenkins, 2009). He lays strong emphasis on manager's role and strategic integration of the processes.

The studies of the theoretical and empirical researches on socio-cultural context and managers choices for strategic philanthropy, led us to pinpointing several ideas, which we translated into a theoretical framework for managerial decisions in favour of transectorial strategic philanthropy. The proposed frame (Fig. 1) is a four-stage pathway to facilitate the process of adjusting expectations of all internal and external stakeholder groups. The findings present a map of how these expectations correlate with the socio-cultural context (political, geographical, cultural, historical, religious) and other main factors, such as size and the scope of the company. It offers a set of solutions, capable to evaluate the strength of each factor and to mitigate the influence of the negative ones. The concept of the frame presents different socio-cultural operational contexts with specific stakeholder interests, which are either apparent (clearly expressed) or hidden (suppressed). Consequently, identification of socio-cultural values- external as well as internal, - and tuning them to the organizational values and societal expectations comes on the scene as the determining and essential condition for planning and implementing transectorial philanthropic activities.

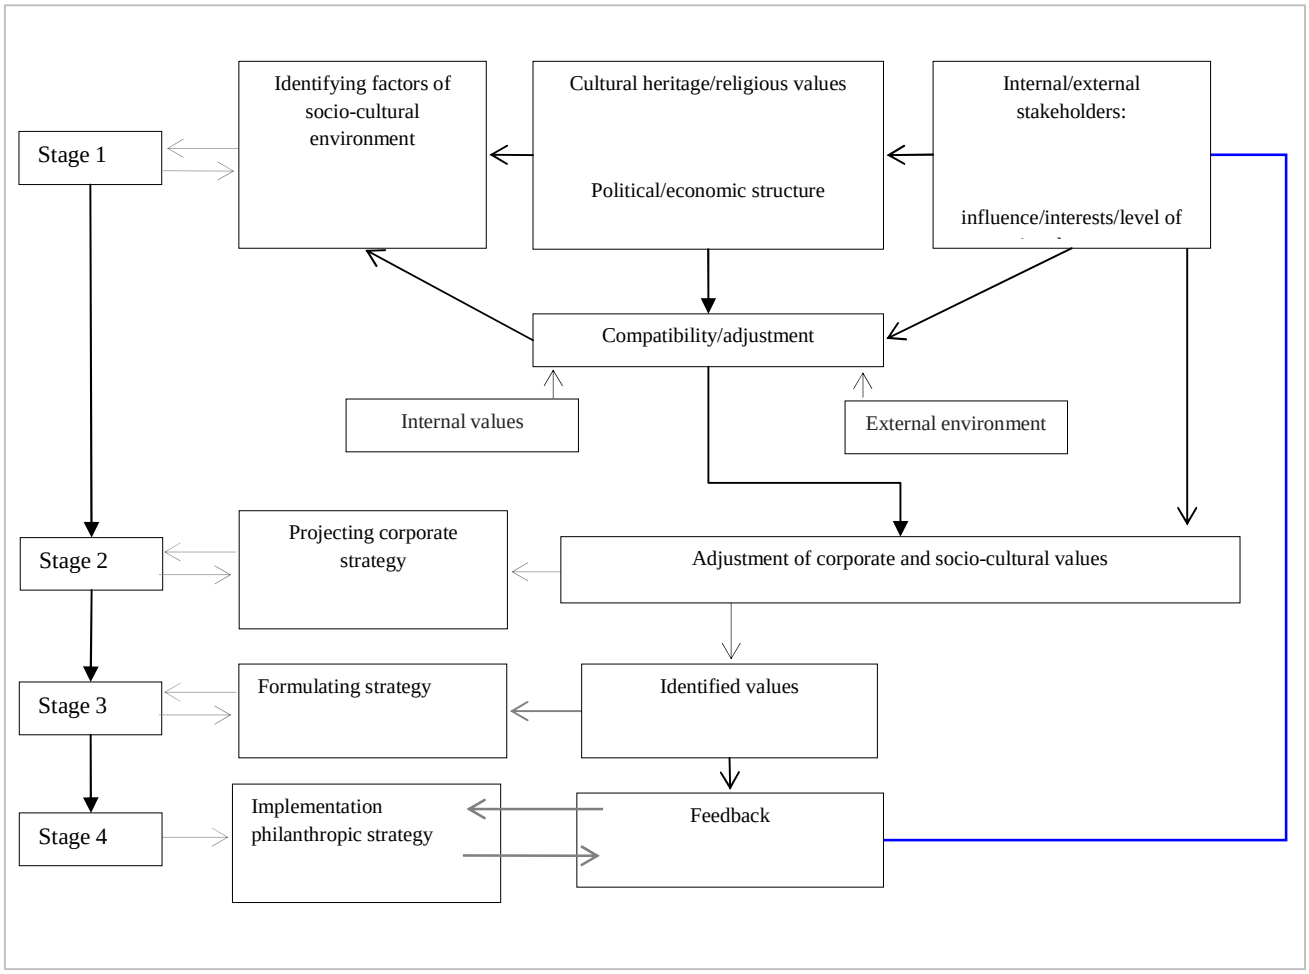

Fig.1 Incorporating factors of socio-cultural context into transectorial philanthropic activities

The studies of the theoretical and empirical researches on socio-cultural context and managers choices for strategic philanthropy, led us to pinpointing several ideas, which we consider appropriate for creating a theoretical frame. The above observations confirm the fact, that most academic work focuses at length on the CSR implementation of in SMEs or strategic philanthropy of big companies.

Conclusions and recommendations

Main findings of this research reveal a correlation between multiple factors of the social environment, stemming from its cultural context, and managers' philanthropic choices, related to strategic objectives of organizations and society. However, these multiple factors as determining variables for philanthropic initiatives of companies, fostering transectorial managerial decisions should be investigated transversely, in correlation with individual values of top managers/decision makers as well as organizational settlement.

A theoretical framework/model for managerial decisions in favour of transectorial strategic philanthropy, developed through this research suggests a set of solutions, capable to evaluate the strength of each factor

and to mitigate the influence of the negative ones. This framework proposes new possible avenues for research of relationships between business and society, moving managers and decision makers beyond the intrinsic assessment of cost benefit ratio of the overall company revenue and encourages scholars to further investigate how transectorial managerial decisions- which can be justly taken for strategic philanthropy- contribute to the betterment of society and at the same time ensure sustainable development of the company itself.

Rethinking the Nature of Firm: New Paradigms

Aurel Burciu, "Ștefan cel Mare" University of Suceava, Romania, aurelb@usv.ro
Rozalia Kicsi, "Ștefan cel Mare" University of Suceava, Romania, rozaliak@seap.usv.ro

Abstract

The theory of the firm should take into account certain specific realities of post-capitalist economies (state regulations, the importance of knowledge as a distinct resource, the implications of technological factors, such as computer networks, and so on). Some theoretical studies on the emergence of a firm in a market focus on the transaction costs (macroeconomic perspective); other studies suggest the type of rules/principles whose application could become a model for the organization of a business (microeconomic perspective). Our study suggests some connections between the two different approaches in the theory of the firm.

Keywords: firm theory, transaction cost, business excellence, reengineering, knowledge-based firm

1. Introduction

The global economic crisis (of the end of 2000s) surprised the entire world by its intensity, contagion, and economic and social consequences. For the first time, economists have begun to compare the current period of crisis with the Great Depression of the '30s (Roubini, 2011; Krugman, 2009). Study of business cycles, the relationship between the capitalist state and business world, monetary policies of central banks and other similar topics suddenly became much debated. In fact, we can say that the old dispute between Keynes's view (who claimed direct state intervention in the economy through investment, monetary policies and other instruments) and Hayek's view (who believed that government intervention is an error and that only the market can restore the economic balance) returns in economic theory; it is difficult to say which of the two views are more suitable to be considered by policymakers today (Hayek, 1933; Keynes, 1973; Keynes, 2009). In an attempt to diminish the effects of the global crisis and mitigate its social consequences (bankruptcies, unemployment, panic spread over large social groups, loss of income, etc.), states have adopted different measures from one case to another. Most economists agree that during a moderate recession or even a severe economic crisis the capitalist state must react adopting appropriate macroeconomic strategies to limit social effects of such economic phenomena. But there is no theoretical model to be followed by the state and by companies to get out of a deep recession. In other words, the behaviour of large social groups and the reaction of firms during a recession or a crisis requires new theoretical analysis. This is because the realities of the world in which we live (with its main characteristics: technical/technological factors, computer networks, EU integration processes, interdependence between individuals and organization, education, scientific research, knowledge as a distinct resource, etc.) differ fundamentally from the realities over seven or eight decades ago. Furthermore, economists have been forced to accept the idea that the current economic crisis reveals the need for reconsideration/redefinition of classical views in economic theory. Among such issues, we believe, the theory of the firm gains more importance in scientific and empirical research; however, the classical economic theory provides only a few answers on this subject.

In our point of view, approaches of the theory of the firm can be differentiated to some extent, depending on the perspective in which it was located by authors:

- Studies on the nature of the firm from a macroeconomic perspective (emphasizing market and resource allocation mechanism to outline a theoretical model of the firm);
- Opinions and studies on the theory of organization predominantly from a microeconomic perspective (the emphasis is on rules/management principles applied by firms that tend to excellence

or peak performance; we understand that the description of such rules may provide an answer to the theory of firm, meaning that other less efficient firms will be inspired by the model described).

2. Macroeconomic view on the nature of firm

During more than two centuries of economic theory, from *The Wealth of Nations* by Adam Smith (1776), economists have failed to fully and concisely answer the question "What is the optimal/ ideal model for organizing a business?". We understand a firm like any type of economic "actor" (enterprise, company, corporation, etc.) acting/performing in a competitive environment; this means that economic resources are allocated through the market mechanism, in terms of competition. In connection with the previous question, we could formulate another question: "What kind of management leads to performance?"; in other words, which are the principles/rules to be applied by the owners/managers to achieve success in business?

Given the very large diversity in which we can find companies in business environment (by sectors, by activity, by size, etc.) we believe it is extremely difficult to "cover" a diverse reality through a single abstract model of firm (Anderson et al., 2002). And if this diverse reality cannot be simplified enough to be included in a single theoretical model, then, as Lipsey stated, economists would require dozens of different theories or even "... a theory for each type of company ", in which, perhaps, it would reach some consensus on this topic (Lipsey, 1990, p. 177). In the capitalist economy, during a turbulent period a company can reach bankruptcy, which means negative consequences for the owners, employees, banks, and other *interest groups (stakeholders)* (Cooper, 2005).

Any company has two “dimensions” which are in a deep interdependence:

- The human dimension, namely managers, employees, including various types of knowledge like know-how;
- The material dimension, i.e. buildings, equipment and other tangible assets.

It is noticeable that the various approaches or studies focusing on macroeconomic perspective have attempted to explain how a company strengths its position in a given market. As mentioned before, certain elements of external environment of the company (such as market, competition, industry, government strategies, macroeconomic trends, etc.) are largely generated by the specific of capitalist economy. Therefore, the founders and/or managers of a company cannot manage (possibly only to a minor extent) the external factors of a company that could affect the flow of business. The current global crisis shows that even corporations with a history of a century or more may go bankrupt (e.g. Lehman Brothers, Freddie Mac in the USA, etc.), due to an increased competition and instability in the business environment; the lifespan and average longevity of global corporations tends to decline in the last three or four decades (de Geus, 1999). Also, due to a deeper interdependence between countries, companies and economic sectors, some technological, social or market trends amplify uncertainty and volatility/chaos of the environment in which companies emerge and develop (Kotler and Caslione, 2009). However, many large companies, but also some of those in the small business sector, managed to overcome the crisis from 2008 to the present and even to identify opportunities in a chaotic environment of business (Kotler and Caslione, 2009). How is this situation, statistically confirmed in the US, but also in some European countries, explained? Which one would be the optimal corporate model today?

During the past decades the literature on the types of companies and the role of entrepreneurs in the capitalist economy shows a variety of approaches. Some authors discuss about industrial enterprise, and mainly about the relationship between costs of such an organization, the importance of entrepreneurs and performance obtained (Hay & Morris, 1986). Like these authors, we agree on the fact that only individuals can propose goals and achieve them. Other authors highlight the importance of the human factor in any type of organization. As Galbraith states, "in any large organization, above all else, there must be a highly developed sense of common purpose” (Galbraith, 1921, p. 67).

After the Great Depression of '29 -'33, a growing body of literature have focused on the theory of the firm from various points of view. (Anderson et al., 2002). Some "atypical" views were initially ignored, as was the Coase's ideas about the nature of the firm. He proposes – as expressed - *a realistic and innovative theory* to tackle the apparent contradiction between resource allocation through price mechanism and the role of the entrepreneur in a competitive economy (Coase, 1937). In his most notable and ground-breaking work, *The Nature of the Firm*, Coase developed the concept of *transaction costs*; the costs of organizing a specific activity vary from one company to another, so a firm enters and remains in business as long as its operational costs to achieve its goals are lower than the similar costs of other firms and those related to market transactions (Coase, 1937). We believe that in order to achieve lower transaction costs, certain rules/principles of management have to be applied within the company. So, the focus on microeconomic perspective could explain the way any business organization can gain and strength its position in certain market (Coase, 1937).

Another noticeable point of view is developed by Williamson; based on Coase's concept of transaction costs, he focuses on the organization of production, transaction costs, vertical integration of production in certain sectors, the behaviour of "actors" in business environment, i.e. entrepreneurs and employees, etc. (Williamson, 2010). We believe that the main Williamson's contribution to the theory of the firm lies in the fact that it raises new questions (Williamson, 2010): "What is the size to which a firm can increase in a certain market?"; ""How do operating costs evolve with the increasing of specific hierarchical bureaucracy in any company?". Yet, we don't have coherent answers to such questions, so that further research/approach in theory of the firm is desirable.

3. Developments in organization theory: microeconomic view

We want to emphasize that emerging of an enterprise and strengthening its position in a certain market cannot be fully explained without taking into account the company principles of management. This is because any type of firm must manage a certain amount of "operating" costs to achieve its long-term goals. Today, it is quite widely accepted the idea that investors, founders or managers of any company should have a moral behaviour when allocating resources to establish a new company; the achievement of company goals should sustain the achievement of the common interest, so it goes beyond managing costs and gaining profit.

In order to open some new areas in the theoryof the firm we can follow a parallel view to those of Coase (1937), Williamson (2010) and other authors on this topic. In other words, it would be desirable to be able to state a core set of rules/principles for an ethical management, which could be a "model" of gaining performance for any company.

We will briefly bring to the fore some views enshrined in practice of business economics which may provide some answers in the theory of the firm.

In the theory and practice of business organizations a distinct, coherent, and very pertinent point of view belongs to Peter Drucker and it has been developed about six decades ago, starting with his works *Concept of the Corporation* (1946), *The Practice of Management* (1954), etc. After a comprehensive study on General Motors Corporation (on the constitution, internal organization, structure, key principles applied in daily practice, divisional organization and decentralization of power, the adaptability of the company in an unstable business environment etc.) Drucker lays down certain rules/principles of management that became later an "organizational model" for other companies, government agencies, universities and other organizations (Drucker, 1946). Later, the author proposed the concept of *management by objectives and self-control (MBO)* as a principle that should underpin the internal organization of any company. Essentially, an MBO program starts by negotiating objectives from the CEO to the bottom, at all levels, reaching, if possible, to every employee (Drucker, 1954). Therefore, we conclude that any employee who voluntarily accepts certain annual targets will be by default self-motivated to achieve maximum performance in their daily work (i.e. company's operating costs lower than other competitors, etc.). Finally, Drucker made over time other valuable opinions about the mission of the company, the market in which it operates,

the knowledge economy, etc.; between such views we mention (Drucker, 2001; Drucker, 2002; Drucker, 2008):

- The purpose of a company should be sought in society and refers to the common interest, in the sense that the company should add social value by products/services performed;
- Gaining profit is just a condition for the lucrative company and not an end in itself (companies must comply ethics / moral rules imposed by society);
- Performing firms tend to control the entire value chain of a product/service, so to cooperate in the context of competition for customers (organizing alliances/partnerships strategic alliances after the keiretsu model of Japanese firms practice);
- Knowledge has now become essential resources for any business, and computer networks have become a major asset to jointly acquire and share this resource;
- Employees in a modern company must accept the idea of lifelong learning individuals and as members of a management team (lifelong learning).

Drucker's perspectives on the context in which a firm appears within a capitalist economy, as well as the ways in which it gets time performance, are quite broad. We conclude that the rules/principles of management underlying the capitalist company have a dynamic character and therefore change according to evolutions of the capitalist society. Secondly, it follows that any model in the theory of the firm must take into account the current realities of capitalist society; since the early 1980s to the present, computer networks have become a vector of social progress and, consequently, should be included as a constituent in the theory of the firm. Thirdly, we conclude that the capitalist state must "reinvent" itself to manage failures that occur in the market mechanism.

The concept of *business excellence*, proposed by Peters and Waterman (1982) is based on a survey of a sample of 43 high-performance companies, a study through which it was attempted to answer the question "What rules/principles of management apply in practice performing companies?" In fact, the authors develop a model of the ideal firm; moreover, if we can answer pertinently the question raised, we can then generalize those rules/principles. Following the study, Peters and Waterman concluded that there are eight management principles that lead to business performance in the capitalist economy (creating a favourable climate for quick action, the company is targeting customers and their needs, new ideas from employees are encouraged, business innovation is used simultaneously with decentralization of powers, members of the organization share common values and are self-motivated in the daily work etc.) (Peters & Waterman, 1982). If we generalize the conclusions of the two authors, we can say that there are eight rules, which we can note R1, R2, ..., R8, which can be implemented by companies outside the reference sample; these rules can become a guide and/or a "model" for other firms in any capitalist economy (Burciu, 1999). Among other findings, we conclude that firms that tend to excel in their field get lower operating costs compared to other competitors (in time was found, however, that such firms can withstand only a limited time as part of the performance sample; therefore, any model in the theory of the firm has a dynamic character).

Another concept, namely the *reengineering* of the company, argued by Hammer and Champy (1993) proposes certain criteria for establishing / redesigning of a business, starting from the "white sheet"; businesses, say the two authors, should be designed based on processes and not on the basis of separate operations, which would increase the company's performance by 100% (Tacu, 1998; Hammer, and Champy, 1993). More specific, the concept of reengineering of a firm places knowledge and computer networks at the centre of the proposed criteria for setting/redesigning a company (when the company is already in a market, decision makers can redesign the entire organizational structure based on processes by leveraging advantages brought by IT and knowledge revolution) (Tacu, 1998; Hammer, and Champy, 1993). Theoretically, if a newly established company and/or an existing one on the market increases its performance by 100% compared to the average of its domain, it would, consequently, lead to a major reduction in operating costs. Among the various advantages that the computer brings is the exploitation of knowledge as a distinct resource for any business (applying one Business Process Reengineering -BPR), we mention the following (Hammer & Champy, 1993):

- Information/knowledge occurs simultaneously in as many places as needed in the structure of the company;

- A general employee can perform the work of an expert (to some extent);
- Can be simultaneously harness the advantages of centralization and decentralization of competencies?
- Decision-making is part of the duties of each employee;
- Staff in the field can transmit and receive information/knowledge wherever they are.

So, this concept of BPR suggests some principles of management applied on the basis of which a company can significantly reduce operating costs through process-based organization of all activities within its structure (about the product/service, technology used, market and management structures).

Finally, the so-called "holonic firm/network" can be, in our opinion, another contribution to the foundation of the theory of the firm. This concept of *holonic company* was proposed by Mc.Hugh and other authors (1995) in the field of theory of organizations; it constitutes a kind of extension of the concept of our previously mentioned BPR. When a firm achieves the status of "excellence" in its activity (whether or not it applies a BPR program), it can opt for the establishment of strategic alliances with other firms in the industry; all *n* companies must take into account the wishes of their common customers and can propose adding social value to products/services developed. In other words, holonic networking must not be motivated by getting extra profit; on the contrary, such networks should target the common good and the fulfilment of social responsibility (*Corporate Social Responsibility*) (Drucker, 2008). However, through the joint exploitation of new knowledge, extensive use of computer networks and by creating strategic partnerships of "holonic network", companies can reduce their operating costs. (McHugh et.al, 1995). In fact, we believe that the concept of holonic firm/network approaches clearly the Drucker's idea about controlling the entire value chain of a product/service for businesses and consumers to obtain mutual benefits (Drucker, 2001). In other words, different theoretical developments often reach a common point in trying to propose / suggest some management rules/principles that can be applied by a company to strive for optimal model of organization of a business.

Among other findings, we conclude that there are multiple approaches to microeconomic theory of the emergence and consolidation of modern organizations from different markets; we believe that only a synthesis of different opinions mentioned can support us in trying to build a model of optimal firm. However, we believe that modern capitalist state today should be included in any theoretical construction regarding the optimal model of the firm; companies are required to accept the idea of building *a moral capitalism* (Young, 2003), and this goal cannot be conceived without the active role of the state/government.

4. The need for a new approach: knowledge-based model of the firm

One of the recent developments in the theory of the firm is called *knowledge-based firm*, in which case theorists believe that what we call knowledge plays a major role in explaining how a company appears on the market and how it strengthens its position in time. In other words, this theoretical concept considers that various questions in the theory of the firm (its existence, transaction costs, organization and management applied, the performance obtained, etc.) can be adequately explained on account of knowledge as a resource exploited by business organizations. The concept of *knowledge-based firm* has occurred in economic theory recently, with the establishment of what we call the knowledge economy /society; more precisely, since the 80s, several areas were highlighted in theory, such as KM (*knowledge management*), LO (*learning organization*), etc. The concept of the LO is argued mainly by Peter Senge (2006) and is based on certain courses of action for decision makers in any firm to establish lifelong learning for individuals and per organization (mental models applied, common vision of the company, team learning, etc.). In the KM, a distinction is made between *explicit knowledge* (those found in textbooks, books, etc.) and *tacit knowledge* (those obtained through direct experience and practical skills). An extremely popular topic in KM is the SECI model (Socialization, Externalization, Combination and Internalization) which explains the mechanism of conversion of tacit knowledge into explicit and vice versa. From this perspective, we understand that explicit knowledge is available to all employees and/or companies, while tacit

knowledge is highly personal in nature; the latter depends on the ability and effort of each employee to learn, on KM and HRM strategies of the company, and also on the relationship between groups and teams of employees and other similar factors. In other words, we believe that any attempt to explain the emergence and consolidation of a company in a particular market should refer especially to tacit knowledge; particularly the quantity and quality of this kind of knowledge could explain different actions and performance of firms in the same sector and/or in different ones.

In the most general sense, one can say that any firm performs a particular product or service that should have value for customers, resorts to some technical process /technology, relates to a real market where there are other competitors and applies certain rules/principles of management. Ideally, the founders and/or managers of any company should aim at a long-term mission of the organization, identifying core competencies of the company and keeping in mind that any business organization must add value in the social sense (it is not sufficient managing operating/trading costs). An indirect argument about knowledge-based firm is the fact that in the OECD countries, since 2008, most new entrants have targeted knowledge-based industries and services (OECD, 2014). Therefore, we believe that various studies and developments in firm's theory will relate in the future directly or indirectly to the qualification of employees in companies and highly specialized knowledge that every business organization must have.

In our opinion, describing an *optimal knowledge-based model of the firm should follow two tracks of study*. Firstly, it can be said that any firm appears and consolidates in a given market when its founders or managers manage to identify a set of *new tacit knowledge* and also when it has qualified employees to exploit this set of knowledge into products/services required by customers. Theoretically, if such knowledge is identified, we can hope that the company will be able to have lower costs than other competitors in the development of a product/service desired by customers. Secondly, it can be said that the company appears on the market when the decision maker manages to identify new ways of combining *explicit knowledge* that exist and are known in society at a time. Intuitively, we understand that the distinction between the two lines of analysis in theory can be only methodological, whereas the separation of the two classes of knowledge is purely theoretical. In other words, also for identifying new ways of combining explicit knowledge, there is a need for skilled employees and their tacit knowledge available to them as individuals and management teams.

On the other hand, identifying a set of new tacit knowledge and/or new combinations of explicit knowledge may relate to product/service developed by the company, the technology used, market analysis or management structures applied (in Figure bellow we separate the four issues of interest for any business organization).

Various studies on the *knowledge-based firm theory* relate directly to Coase and Williamson, who wrote on transaction costs and internal organization of a company; we conclude that this approach attempts to take into account both macroeconomic perspective and microeconomic theory of the firm (such studies emphasize the role of knowledge to improve the company's organizational structure, operation of hierarchy in the flowchart, relations between departments or groups of employees etc.) (Grant, 1996; Kirsimarja, and Aino, 2009). In our opinion, the model proposed by Nonaka and some authors analysing how to create knowledge remains of reference on this topic (they discuss several components of the model, namely: application of SECI process through dialogue and practice in the firm, senior management vision regarding the exploitation of knowledge; inter-organizational context in which employees and corporate groups relate; assets of knowledge type; business relationship with the environment to create knowledge, etc.) (Nonaka, Toyama, and Nagata, 2000; Nonaka, and Toyama, 2002; Nonaka, and Toyama, 2005). It can be said that this last concept in the theory of the firm emphasizes very fair the subjectivity of decision makers of organizations on the creation of new knowledge, the relatively high cost of this process, the difficulties of transforming tacit knowledge in explicit and vice versa etc. However, we understand that any model in the theory of knowledge-based company has inevitably a dynamic character; from this point of view, we can suggest a framework to underpin knowledge-based companies (Figure 1).

From our research perspective, this general framework of the theory of the firm can contribute to joining the firm's two perspectives of analysis and some future developments on this topic.

As noted in Figure bellow, the general framework proposed by us includes several elements (the values the managers believe in, the relationship between explicit-tacit knowledge, social capital, core competences, etc.) but we believe that certain relationships that occur between such elements are significant.

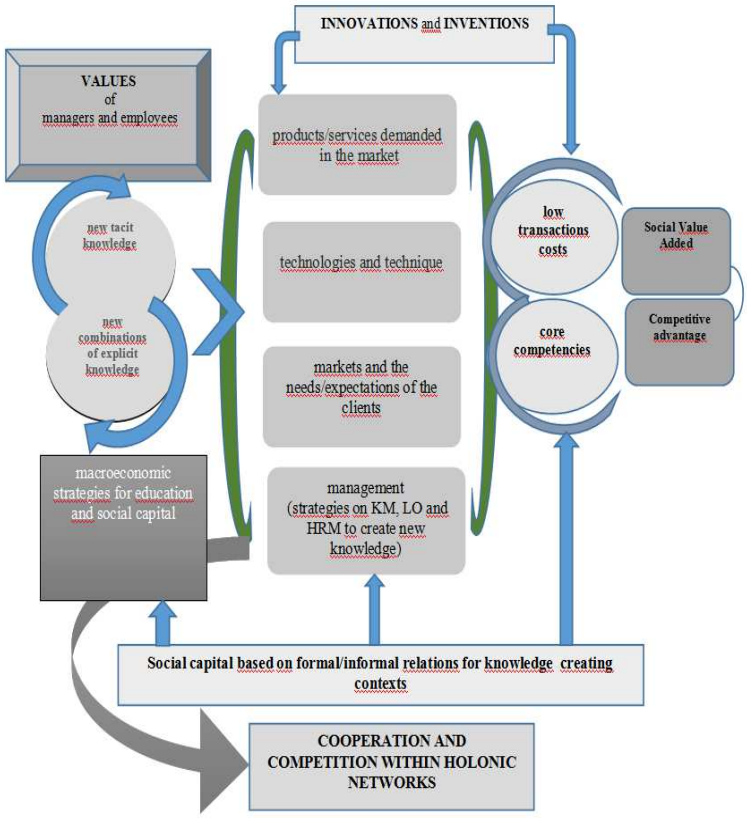

Fig 1. Knowledge-based model of the firm

Source: Created by authors

Every company should focus on identifying the new tacit knowledge and / or new combinations of explicit knowledge to impose on the market and meet the *client needs/expectations*. The premise from which founders/managers of a company start remains essential, we believe, in all economic theory; we believe that the value managers and employees of emerging market companies believe in will finally make the added value of the firm, i.e. fulfilling the mission proposed (the mission of any business organizations should aim at the common good and not just getting profit).

Theoretically, it is sufficient for the firm to identify new knowledge and, respectively, innovations/inventions in any of the four specific aspects of an entity of such type (product/service, applied technologies, market and customers; rules/principles of management). We understand that it is ideal when the founders and/or managers are able to identify new knowledge and/or new ways of combining them on all four specific aspects of this type of organized structure. To remain on the market, the company must achieve permanent inventions/innovations meaning lifelong learning (LO) and distinct strategies in KM, HRM to create new knowledge continuously.

To be successful in a market, every company should have a long-term mission, which should aim at adding social value, that is, to make a small contribution to the social good. Since the modern capitalist economy now includes three major distinct sectors (corporate, social and the state's economy) the theory of the knowledge-based firm will develop in the future, we believe, with certain characteristics from one sector to another. In other words, accomplishing the firm's task on a long term remains conditioned by certain costs of operations (but the purpose of the company is to add value and cannot be reduced to management of costs).

Acquisition and processing of knowledge by a firm require relatively high costs, as well as qualified, motivated employees, willing to participate voluntarily in the permanent creation of new knowledge. Consequently, we need appropriate strategies in KM, HRM to minimize the cost per "unit" of newly created knowledge (piece of new knowledge or information) and, thus, to build "key skills" by any business organization.

The firm will minimize the annual operating costs to the extent that has appropriate strategies in KM, LO and HRM and manages to become a permanent entity that creates new knowledge. Fulfilling this conditionality should confer the firm a long-term competitive advantage. It is understood that the acquisition and permanent creation of new knowledge turns simultaneously into inventions/new innovations that enable decision makers to improve their key skills and, on this basis, to better respond to its customers' requirements.

It is the obligation of the capitalist state, we believe, to build appropriate macroeconomic strategies to support individual education, lifelong learning and social capital to support the production of new knowledge in all social groups. Perhaps the most important contribution of government to new firms in the corporate sector lies in the social climate networks based on trust and formal/informal intensively exploitation of existing knowledge in society (by default, it supports the conversion of tacit and explicit knowledge and the SECI model).

A key element that would play an important role in the theory of the firm is given by the values in which founders, managers and employees of any business organization believe. Such values are important in the very first attempt to identify new knowledge (tacit-explicit) and are associated with subjectivity in the process of creation/operation of knowledge; including the context in which employees interrelate to share knowledge. SECI model of operation and other issues in KM can be explained on account of values in which members of the organization believe (Nonaka et. al, 2000, 2002, 2005). Moreover, the values remain essential in capitalist society to build formal/informal networks and a social capital to foster economic performance (the distinction between good and evil, right and wrong, the redistribution of income, by the state, between social groups, social protection for certain people or families etc.).

In our opinion, a distinct element of the overall framework in knowledge-based firm theory is given by the relationship between any company and state/government since the modern capitalist state influences the market through many direct/indirect instruments. Therefore, macroeconomic strategies for education and social capital may promote or restrict, as appropriate, the emergence and/or strengthening the position of any company in a market. The ideal situation which may tend to be, we believe, is that the state gradually builds social capital consisting of formal/informal relations between groups and organizations that support the creation of new knowledge. So, theoretically efficient firms should constitute alliances/strategic partnerships ("holonic network" type) to share common knowledge in a particular field and be of benefit to joint customers (ideal is when companies cooperate in a competitive context and aim to build a moral capitalism).

5. Concluding remarks

There are many studies on the importance and/or role of knowledge in the functioning and progress of the modern capitalist state and on the performance that business organizations can obtain in different markets. Also, in the sense relied on, the term knowledge is used by some theorists to

explain the mechanism by which countries/companies manage to achieve competitive advantage globally. On the other hand, the acquisition and exploitation of knowledge as a resource by separate firms will always be dependent, we believe, on the mechanism of thought and values of employees in which they believe. In other words, the notion of knowledge remains quite fluid, unclear and, consequently, difficult to define and include in the structure of a theoretical model.

Various theoretical studies on the firm argues quite pertinently, we believe, the idea that a modern company remains directly/indirectly subject to exploitation of this resource called knowledge, so as to satisfy a number of customers and obtain a profit. From this perspective, our study suggests only a general framework to link the known issues from the theory of the firm from a macroeconomic and microeconomic perspective. But this study goes beyond the theoretical corpus because it could have important implications for future practice. Today, in this more and more dynamic and competitive business environment, knowledge has become a vital strategic asset for both individuals and organizations. Companies are more aware of the great importance of knowledge acquisition and knowledge sharing; we believe that these goals are better served by a closer cooperation through business networks, strategic alliances and other types of holonic structures/networks. In the other words, during the next decades, such structures will be models of knowledge-based business entities, boosting their competitive advantage by exploiting the knowledge.

Meditating to Andre Malraux`s well-known quote, we could say that *the 21st century will be a century of knowledge or will not be at all.*

Abstract

F. Black and M. Scholes model comprise the adequate approach to the European options assessment in case when the process of risk asset price change is described by Samuelson model. The paper reports, that in case of the volatility dependence on the price increments, the results differ from the Black-Scholes model, which assumes that the stock price in a short period has a normal distribution. In this case authors recommend applying the imperfect hedge methods.

Keywords: option cost, hedging, financial market, price change, volatility

Introduction

The interest towards the stock market generally and the futures market particularly has grown up recently in the Russian Federation. The financial risk protection and management have also growing importance especially after the world finance crisis that dented the economics of many countries. One of the risk management tools is hedging. Derivative products, such as options and futures, are more frequently used by the economic entities as risk management tools as means of protection against potential financial losses. Competition, formed among the futures trade organizers, contributes to the technically efficient trading mechanism creation and the variety of financial tools expansion.

The goal

To prove that the Black-Scholes model cannot be applied in case when volatility depends on the price increment and to suggest methods that can be applicable for the case, such as imperfect hedge methods.

Perfect hedge methods

Unlike the futures market, the market of financial options, that provide more opportunities for financial risk management, has recently began its formation in our country. There is a necessity to broaden the choice of instruments of risk management and market introduction of new methods, which are based on a rigorous formalization of the decisions of the investor. Currently, perfect hedge methods are used as the main financial risk management tool. Its most important valuable feature is that the value of the option is calculated regardless hedger's preferences (Hull J., 2001). The imperfect hedge methods comprise the new risk management approach. The most distinctive feature of the imperfect hedge method is the generation of the hedging strategy, which deliberately assumes the possibility of loss occurrence (Merton R.C. 1992). Through this process a capital under the controlled level of risk is being released and enables new financial operations. The traditional solution to the problem of financial options hedging is described in the perfect hedging theory (Bachelier L., 1964). The foundations of this theory are laid down in the famous research papers of Black and Scholes, Merton, Cox, Ross and Rubinstein. The theory of a perfect hedging is applicable to the market assets portfolio creation, which generates payments that correspond to derivative ones. The idea of an efficient market is the basis of mathematical models for calculating the option rate.

Equitable option rate is the situation when neither the buyer nor the seller, on average, do net get profit. Equilibrium process functions are used to calculate the option rate. They model the change of price of the risk assets, which are in the option basis. One of the most important statistic variables influencing the option rate is the price volatility of assets that form the basis of the option. The higher it is, the higher risk of incorrect predictions of asset prices in future periods and, therefore, the premium rate increases and the option seller earns more money. The second important parameter is the option expired date. The further this date, the higher the premium rate (at the same price of the asset delivery, specified in advance in an option contract). The parameters of such an option-pricing model are calculated on the basis of historical dynamics. Wildly spread Black–Scholes Option Pricing Model (OPM) defines a theoretical price of a European option, by implying an implicit market option rate adjusting, if the assert underlying the option is traded on the market. This model is widespread in practice and, moreover, can be used to estimate all derivatives such as warrants, convertible securities, and even for own capital estimate of financial affiliates. According to this model, a key element in determining the option price is the volatility of the asset underlying the derivative instruments (Neil A.C., 1997). The asset price increases or decreases depending on the volatility rate, and it is in direct ratio to the option rate. Thus, it is possible to calculate the market volatility with the given option rate. There are several assumptions underlying the Black-Sholes model:

- The underlying stock does not pay dividends during the option's life.
- The Black-Scholes model assumes that there are no fees for buying and selling options and stocks and no barriers to trading.
- Interest rates are also assumed to be constant in the Black-Scholes model. The risk-free rate is used to represent this constant and known rate.
- It is possible to borrow and lend any amount, even fractional, of cash at the riskless rate.
- The Black-Scholes model assumes that markets are liquid and there is possibility to purchase or sell any amount of stock or options or their fractions at any given time (Black F., Scholes M., 1973).

The instantaneous log returns of the stock price are an infinitesimal random walk with drift; more precisely, it is a geometric Brownian motion, where its drift and volatility are constant. The Black-Scholes model is based on the riskless hedging model. The model implies that we hedge the option by buying and selling the underlying asset in just the right way when the profit covers the losses and conversely. Riskless hedged position should bring a return that equate to riskless interest rate, otherwise there would be an opportunity to extract arbitrage profits. Investors would lead the option price to the equilibrium level, which is determined by the model, in order to take advantage of this opportunity.

The case of volatility dependence on price increment

It is worth to mention that the results differ from the Black-Scholes formula, which is based on the assumption that changes in stock prices over a short period have a normal distribution, when the volatility depends on the prices increment (Shiryaev A. H., 1998).

Let S_t – the price of a stock at time t. Let's turn from the process S_t to the process

$$h_t = \ln\left(S_t / S_0\right)$$

The Sumuelson model assumes that the process h_t is described by the stochastic differential equation

$$dh_t = \left(\mu - \frac{\sigma^2}{2}\right)dt + \sigma dw_t$$

Where μ – coefficient trend, σ – volatility coefficient, w_t – wiener process. Assuming that volatility coefficients depend on h_t , the equation changes to: $dh_t = a(h_t,t)\,dt + \sigma(h_t,t)\,dw_t$. The Black and Scholes formula is the following (Karatzas I., Schreve S.E. 1998):

$$\frac{\partial V}{\partial t} + \left(r - \frac{\sigma^2}{2}\right)\frac{\partial V}{\partial h_t} + \frac{\sigma^2}{2}\frac{\partial V}{\partial h_t} - rV(h_t,t) = 0$$

The solution to $\frac{\sigma^2}{2} = Ah_t + B$ the equation assuming that the volatility is a linear function of the increment of prices, is the following:. After Laplass conversion the equation changes to:

$$\frac{\sigma^2}{2}\frac{\partial^2 V}{\partial h_t^2} + \left(r - \frac{\sigma^2}{2}\right)\frac{\partial V}{\partial h_t} - (r+s)V(h_t,t) = -V(h_t,0)$$

$V(h_t,0)$ – the initial condition which is assumed to be given. This is the second order inhomogeneous linear differential equation. Its corresponding homogeneous equation can be integrated via the confluent hypergeometric function:

$$V_1 = \Phi\left(-\frac{r+s}{A}, \frac{r}{A}, h_t + \frac{B}{A}\right)$$

To write the solution down to the inhomogeneous equation, another linearly-independent solution is taken:

$$V_2 = \Phi\left(1 - \frac{2r+s}{A}, 2 - \frac{r}{A}, h_t + \frac{B}{A}\right) \cdot h_t^{1-r/A}$$

Wronskian determinant for the solutions:

$$W = \left(1 - \frac{r}{A}\right) \cdot h_t^{1-r/A} \cdot e^{h_t}$$

Consequently, the solution to the original equation would be:

$$V(h_t,t) = -V_2(h_t,t) \cdot \int \frac{V_1(h_t,t) \cdot V(h_t,0)}{(1-r/A) \cdot h_t^{1-r/A} \cdot e^{h_t}} dh_t +$$

$$+V_1(h_t,t) \cdot \int \frac{V_2(h_t,t) \cdot V(h_t,0)}{(1-r/A) \cdot h_t^{1-r/A} \cdot e^{h_t}} dh_t + C_1V_1 + C_2V_2$$

This means that the Black-Scholes model cannot be applied in the case when the volatility depends on the price increments. Although it is often the case in the real life.

Imperfect hedge

Identified problem can propose to be solved by applying the imperfect hedge method. Imperfect hedge method is the newest tool of risk management (Hull J., 2003). The theoretical comprehension of the method was initiated only in the 1990s, by Richardson and Duffi (1991), Nechaeva and Melnikova (1998), Fellmer and Leickert (1999, 2000) (Hull J., 2008). Moreover, the studies are focused on the search for the mathematical solution to the problem of an imperfect hedge strategy construction. The issues of economic efficiency justification and practical applicability of the methods are not considered in the researches. Imperfect hedge methods allow reducing the cost of

risk protection by adopting a controlled risk of losses. The traditional model of decision-making suggests that, rational economic actor will always prefer greater profits smaller. Rational market actors also avoid excessive risk and ready to take it just in case of remuneration or high rate-of-return compensation. That is why option contract risk management comprises expected return maximization at a controlled risk level, or risk minimization of the desired level of profitability. That is the key idea and main feature of the methods of option imperfect hedging. The source of the risk is the open option position structure. Risk manager is able to control the ambiguity level by changing the structure. Assuming option payments sometimes being not fully paid or not paid at all means that replication strategy implementation expenses in such cases are reducing due to the default risks. The most important issue in such cases is to define such situations when the replication failure will cause inconsiderable risk increase and considerable increase in the desirable returns on investments. The use of a number of different type option combination and different strike prices is a significant practical difference of the imperfect hedge Black-Scholes model (Bouchaud J.-Ph., Potters M., 2003). It should be noted that the combination depends on such model parameters as the volatility, the average growth and the bank interest rate. Hedge strategy might be optimal on the following criteria: success probability maximization and expected losses minimization with regard to volatility, average growth and bank interest rate. The exact relationship form varies and depends on the option type and parameters.

Conclusion

The article illustrates that in case when volatility depends on the price increment, the Black-Scholes model shows different result. The model is based on the assumption that changes in stock prices in a short period has a normal distribution. This model is practically widespread and can be used for derivatives evaluation and even the evaluation of the stakeholders' equity financial affiliates. The imperfect hedge method application is suggested in case of the volatility dependency on the price increment. The current Russian derivatives market development allows using the new imperfect hedge methods effectively.

The Demographic Pressures on Public Pension Systems

Tudor Colomeischi PhD, Stefan cel Mare University Suceava, Faculty of Economics and Public Administration, Romania, tudorcolomeischi@yahoo.ro, tudorc@seap.usv.ro

Eugenia Iancu PhD, Stefan cel Mare University Suceava, Faculty of Economics and Public Administration, Romania, eiancu@seap.usv.ro

Abstract

One of the basic components of social security of a state is the national pension system, it providing virtually the true image of the political, economic, demographic and cultural evolution of a state. The importance of the pension system is enhanced by its direct link with both labor cost developments and the stock market or individual savings. The paper tries to capture the pressure on pension systems in the medium and long term, the future of pension policy in the context of social protection policies in Romania, also making a series of projections on the future evolution in different assumptions of economic and social context.

Keywords: standard age, massive aging, life expectancy, conditions of probation, seniority, fertility rates, social protection system

Introduction

Pension systems in all countries have been affected by the economic and financial crisis broken out globally, especially in 2008-2010. Its effects were felt mainly in Defined Contribution (DC) pension schemes, participants in these plans being increasingly skeptical about their ability to ensure decent pensions. The plans of contributions type defined require, on the one hand, periods and greater odds of contributions, and secondly investment plans and strategies for managing longevity risk appropriate to the market in which it operates and the characteristics of the participants in this market.

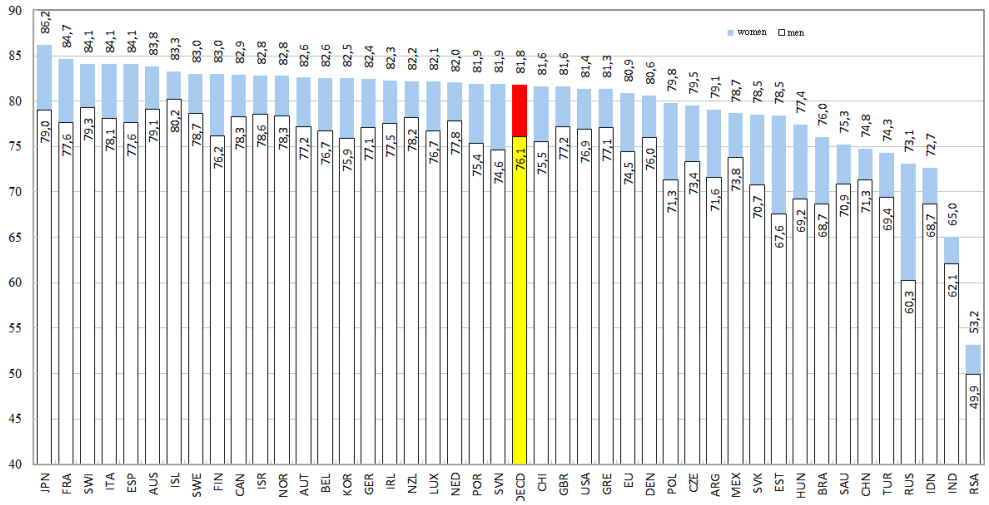
The most visible parameter of the pension system is standard retirement age. Increasing the retirement age in activity proved to be among the most controversial measures of the pension reform. As the main trend in the evolution of the average retirement age is observed a decrease in the second half of last century, reaching an average of 62.5 years for men and 61.1 years for women in all OECD countries. As a result, existing laws provide for its growth to at least 65 for both sexes by 2050.

Data analysis

Economic and fiscal pressures on public pension systems will become even more severe in the future because of demographic trends that will lead to a massive aging of the population from 2020. British organization "Help the Aged" announced that "worldwide in 2011 about 1 in 10 people has more than 60 years. In 2025 this ratio will be 1 in 5". (www.ageuk.org)

Population aging is a global phenomenon, manifested by two demographic trends particularly important: increasing life expectancy and decreasing fertility rates.

In Figure no. 1 we have represented *life expectancy at birth* for both men and women in some countries of the OECD (Organization for Economic Cooperation and Development) and others. It is noted that the average life expectancy worldwide was 76.1 years for men and 81.8 years for women. The highest life expectancy was 86.2 years for women in *Japan* and 80.2 years for men in *Iceland.* The opposite situation was for *South Africa*, with a life expectancy of 49.9 years for men and 53.2 years for women.



Source: www.oecd.org

Figure no. 1 The average life expectancy at birth (years)

In Europe in 1990 were 500 million people over 65, while the number will reach 1.4 billion by 2030. Life expectancy will also increase by nearly five years in 2050, compared to 2000. Thus, starting from the current life expectancy of persons aged 65 years of 15.5 years for men and 19.5 years for women, the mentioned 5-year growth will push up costs by 25- 30%. Considering that it would retire generations born after the Second World War, an aging population causes increasing concerns among European states.

Increasing life expectancy was driven by improved living standards and education, and medical science breakthroughs (Antolin, 2011). They are obviously a social benefit, but at the same time require extra effort from governments and active individuals in order to support pensions for a longer period. Reduce fatalities phenomenon which can not be predicted is called longevity risk. Longevity risk has a major influence on the state, employers, employees and the businesses of life insurance, which "must ensure that longer life is a benefit to society and does not turn into a financial burden," said Christian Mumenthaler expert of the reinsurance company, SwissRe.

In addition to increasing life expectancy, another cause of aging was the downward trend in recent years of fertility rates. According to UN projections currently available in all countries in the world, age structure of the population will age over the next fifty years. This can be seen very well in Table no. 1, which presents projections for the share of population over 65 in total, during 2008 and 2060 in EU countries. The process takes place at different speeds in the various regions of the world and starts at different levels, but affects every country. The potential impact of demographic changes in age and size structure of populations is dramatic. According to UNO (United Nations Organisation) projections, the average age of the population of *Japan* is expected to grow by eight years between 2000 and 2050, from 41 to 49 years. In *Italy*, the average age is expected to reach 53 years by 2050, the proportion of those aged over 65 will exceed 35%.

Table no. 1. Share of population aged over 65 in the total population during 2008-2060 (%)

	2008	**2035**	**2060**
Belgium	17	24,3	26,5

Switzerland	16,4	25,2	28

Source: United Nations (2008). *World Population Prospects* – The 2008 Revision

A similar evolution is assessed that will have an indicator called the age dependency ratio (ADR - Age Dependence Ratio), which is the number of people over 65 reported 10 active people (aged 15 to 64 years). While currently this rate is set around a 4 average for EU countries (ie 24%), it is expected to reach 8 people over 65 every 10 active persons by 2045 (or percentage 49%), an increase far greater than foreseen, for example, US. Consequently, the financial transfers channeled from the active to the retired population will have to double in the coming decades, so that future retirees to maintain their current standard of living. However, for the reasons given above, it is very unlikely that this increase in transfers between generations can be achieved by doubling contributions. It will consider other measures that limit the consequences of aging on pensions (Arza, 2011).

In addition to aging, many countries will be faced with the phenomenon of decreasing population number. *European Union* as a whole is expected between 2000 and 2050, to lose 10% of its population. For example *Italy*, a country of currently 57 million inhabitants, will have a population of only 41 million by 2050. The population of *Germany*, currently 82 million, is projected to decline to 70 million by 2050.

The paces of demographic change, together with the current and projected size of the older population, presented below, are important variables in terms of financial sustainability of pension systems (Colomeischi, 2014).

The data presented in Table no. 2 show that it is possible to identify three *types of demographic transitions*, each of them corresponding to one of the three major regions of the world. In *Western Europe*, aging occurs at relatively moderate pace, but by 2040 the population over 65 is expected to exceed 25% of the population in all countries. In *North America*, aging also occurs in relatively moderate pace, and the US is unlikely to reach such extreme levels.

Table no. 2 Proportion of people over 65 in total population during the period 1980-2040 (%)

	1980	2000	2020	2040
France	14,0	16,2	20,1	25,1
Germany	15,5	16,0	21,6	30,7
Italy	13,4	18,2	23,7	33,1
Sweden	16,3	17,4	23,0	26,8
Switzerland	12,7	15,2	23,3	31,4
UK	14,9	16,0	20,0	25,6
Canada	9,8	12,5	18,7	26,8
US	11,2	12,7	17,0	22,4
Japan	9,1	17,2	27,2	31,5
South Korea	3,8	6,7	13,0	24,6
Taiwan	4,4	8,6	13,2	19,9

Source: www.oecd.org

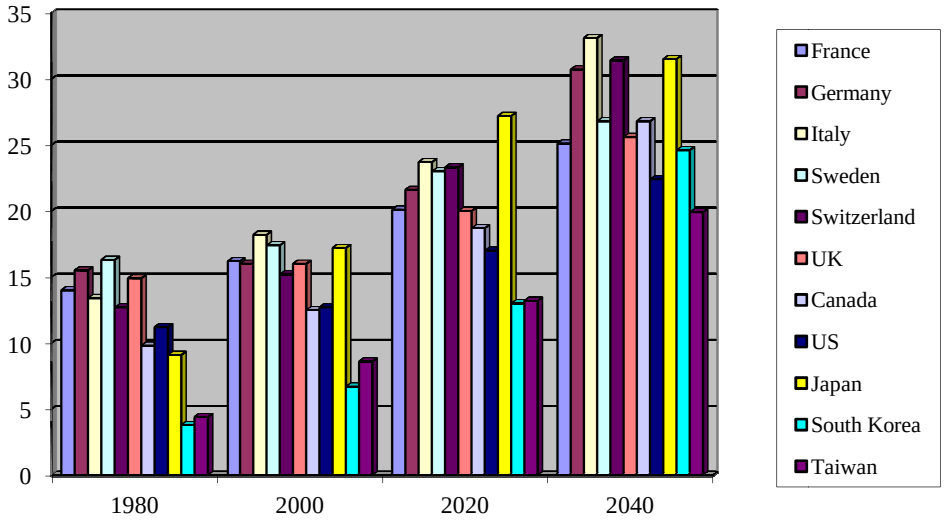

Figure no. 2. The share of population over 65 in total population

Finally, countries in *East Asia* are facing a much faster population aging. While in France, for example, it took 117 years for the population over 65 years to increase its share from 7% to 14% of the total population, in Japan, the same development lasted only 24 years. Japan is also expected to face one of the most serious problems of population aging over the next four decades, when about a third of its population is projected to be over 65 in 2040. Other countries from East Asia are experiencing extremely rapid process of demographic aging, but with a lower starting level, the overall proportion of older people will not reach worrisome levels, at least for a while.

The various models of aging will have a different impact on pension reform policy in Western Europe, East Asia and North America. In Western Europe, pressure is key to long-term financial sustainability. To this end, several reforms have been adopted in each of the countries concerned, in order to gradually reduce the size of state commitment to retirement provision. North America, however, due to a milder aging did not foresee a major reform of public pension systems (Colomeischi s.a, 2015). There are, however, ongoing debate in the US regarding an alleged non-sustainability of social security, but which, to date, not resulted in a major policy shift (Popa, 2011).

The situation is much more varied in East Asia. In this sense, Japan is not much different than in Western countries, with the difference that aging is faster and the step that European countries seem to have taken may prove to be insufficient. In contrast, Taiwan and South Korea has not yet reached alarming proportions regarding the impact of aging on the financial sustainability of pensions. In 2000, these two countries had similar demographic structures that were comparable to those in Western Europe in 1950. The elderly are a rapidly growing group in society, but they are not numerous enough to be a problem for the pension policy. This demographic situation is one that encourages the expansion of the insurance system for the elderly (Frunzaru, 2007).

The above figures are impressive, and their developments will certainly influence many areas of social, political and economic life. They will also influence, public policy, especially in those areas that are related to the age structure of the population of a country, such as old age pensions (Popa, 2011). Increasing the proportion of older people means that younger generations will need to support a larger group of retirees. The financial effort called for active population will increase accordingly. These are just some of the consequences of demographic aging, which helps shape the pension strategies.

Conclusions

Currently, the number of contributors and beneficiaries of the pension depends on the demographic and economic growth, representing basic components which may influence financial projections and the future of public pension system.

According to the scenarios launched following certain studies, the current ratio between the number of retirees and the employees will maintain on the long-term and demographic change will be marked by a decrease of approximately 0.3% per year (amid rate analysis mortality, birth rate, fertility and migration). Population aging, due to the high longevity is enhanced by a fertility rate with declining trends. Meanwhile, the rate of participation in labor of active population, so, of the ones that contribute to the system, is among the lowest in Europe, either due to unemployment or undeclared work or other reasons, which further affects the public pension increase dependency ratio (number of pensioners supported by a small number of taxpayers).

Reducing and an aging population means increasing pressure on the shoulders of the public pension budget, which must support, with fewer contributors (employed and paying social security contributions), a growing number of beneficiaries (pensioners in the public system). Romania's demographic problems show that public pension system is no longer sustainable in this form and requires a deep reform in order not to collapse in the coming decades.

The Strategic Collaboration between European Countries - Solution for Regional Development and Convergence

Petre Adrian
The Bucharest University of Economic Studies
Bucharest, Romania
adrian.petre21@gmail.com

Florea Cristina Andreea
The Bucharest University of Economic Studies
Bucharest, Romania
cristina.andreeaf@gmail.com

Abstract

The world is becoming even more concentrated, interconnected and clustered. In this respect it is important to analyse the perspective for regional development of European countries. The paper is focusing on strategic collaborations between clusters. In this regard, we intend to explain the impact of transnational clusters on regional development and also on achieving the convergence. In the first part of this paper, it is made a research on the scientific literature, in order to emphasize the relevance of clusters for regional development strategy and economic convergence. In the second part, the study focuses on the Romanian clusters implicated in cross-border and transnational cooperation programs, with the purpose to discover patterns in the clusters activity. According to these findings, clusters tend to collaborate with other international companies and networks, developing projects and partnerships, determining thus the increase of competitiveness and sustainability. In the last part of this paper we underline the results of this study and make recommendation on how to improve the regional convergence between European countries. It is important to understand and support the projects on territorial cooperation, mostly because they sustain economic growth, improve the quality of life, diminish the unemployment rate, and intensify investments and technologies transfer.

Keywords: regional convergence, economic growth, sustainable development, clusters, cooperation.

Introduction

The present article represents a theoretical approach regarding convergence process and includes an empirical study on regional discrepancies between European countries. Starting from this point of view we focus on strategic partnerships among clusters.

European Commission supports cluster development and considers cluster as an effective instrument for European Industrial Policy and for Smart Specialization Strategy. Good practices demonstrate that clusters are a model for regional development, which could be applied as a part of regional development strategies.

Clusters ensure the cooperation framework between companies, public authorities, universities, research institutes and catalysts. In order to benefit of European funds, companies and public institutions should become members of clusters. Clusters sustain partnerships from regional level to national and international level, improving the competitiveness of production and sustaining the cooperation.

Transnational European cooperation within clusters creates a balance between Western Europe and Central and South-Eastern Europe. This program aims to correlate the legislation from countries, to establish a base of projects, to promote best practices and harmonized the interests.

Theoretical aspects of regional convergence

The latest theories regarding regional development (such as endogenous growth theory, institutional theory and the new geography), are analysing the dispersion, agglomeration, and the main tendencies of convergence process. According to the endogenous growth theory, the revenues of scale obtained from investments in research-development and human capital, are determining the level of concentration of specific economic activities. The concentration of these factors in the central areas, could be explained as a result of an integration economic process.

On the other side, with respect to Scott, Dimaggio and Powell theory, institutions represent the most important factor of regional development, due to the fact that they are influencing the economics capacity to develop new resources. If the institutional capacity is not equally distributed in the territory, the institutional input strengthens the advanced activities, in the most developed regions.

The third approach of regional theory, is the new economic geography. In this respect, regional clusters are the effect of agglomeration phenomenon of interdependent entities. In the previous theories, the concentration of economic activities is defined as a slow and convergent process, in terms of GDP per capita.

Going further, we will focus on the cluster theory as a factor of regional development and economic convergence. The partnerships between clusters are diminishing the discrepancies between the levels of development of countries, influencing thus the sustainable growth.

Regional disparities are characterizing the countries from South East Europe. Unfortunately these regions have a low capacity of innovation, a weak institutional system, and inefficient laws and regulations. The innovation strategies are not performing to sustain the research-development activity. Few regions could be comparable to European standards, in terms of innovation activity and competitiveness.

According to McKinsey Global Competition Report (Dobbs et.al, 2015: pp.35-84), innovative clusters are based on technical abilities, entrepreneurial talent, research capacities and investments flux. At the same time, public and private approaches regarding investments and research capacity, sustain the initiative of emerging technologies. Consequently, clusters are attracting additional companies and thus, they are creating agglomeration near to research hubs.

Sarach (Sarach, 2014: pp. 250-254) explains how clusters sustain innovation activity, technology transfer and knowledge exchange. According to author, any cooperative relationship between clusters or inside clusters is one of the most important method to stimulate creativity, innovation, knowledge transfer and also provide high-tech technologies. The author used the methodology of proactive management theory and game theory in order to demonstrate the importance of interdependency of cluster members.

For this study, the author analysis one cluster in three steps: the first step is referring to the structure of cluster; the second step is focused on dynamic innovation and also on knowledge exchange within cluster; while the third step is considering a payment matrix using the game theory, in order to observe the strategy of cluster member, regarding the cooperation and non-cooperation. Starting from this point, the author made an analysis on automotive cluster by applying the mentioned strategy. The conclusion was that the cooperation between two or more clusters improves the efficiency and gives value added and benefits to each of them.

According to Lämmer-Gamp (Lämmer-Gamp et.al, 2014: 10:25), market intelligence is the key for new opportunities in business sector, referring to the capacity of collect information about emerging industry in order to explore the benefits. Clusters have the possibility to sustain its companies to access these information and penetrate new markets and future innovation. The authors explained how territorial cooperation and cross-sectoral cooperation between clusters improve the competitiveness and sustain tangible innovations.

Păuna (Păuna, 2014: pp. 175 – 183) explained the importance of cluster policies on improving economic growth, by analysing the policies which sustain cluster development and policies that benefit of information about industrial development in clusters, aiming to develop new policies in industrial domains.

According to the author, a good governance strategy is very important for cluster development and spatial dispersion of economic activities. On the other side, the territorial cooperation between clusters influences the decision-makers and their governance strategy. The author suggest a territorial analysis on clusters, before elaborating the governance strategies or other policies.

Romanian clusters have the same characteristics as other international clusters: companies agglomeration, research centres and education institutions, pool of skilled labour force, consultancy institution or firms, and cooperation projects with purpose to sustain and develop the activity at regional level. Consequently, we will analyse the collaboration between European countries under the auspices of clusters partnerships.

The new geography - transnational cooperation

At this moment, a big amount of clusters initiatives and strategies lie under the auspices of the European 2020 objectives. In order to become effective and competitiveness, the authorities should promote and coordinate the clusters activity on innovation and sustain the cooperation between regions as innovation hubs.

The projects on territorial cooperation sustain economic growth, improve the quality of life, diminish the unemployment rate, and intensify investments and technologies transfer. European Union has three directions regarding territorial cooperation: cross-border cooperation, transnational cooperation and interregional cooperation.

The best examples for territorial cooperation are northern and central European countries. Moreover, in these regions are encountering all types of cooperation. There are countries as Germany, Portugal, Greece and Spain, which manifest a strong tendency for cooperation, even with countries from other continents, determining a transcontinental cooperation (EPSON, 2013:273-276). Conversely, in eastern European countries, prevail the cooperation between cities, an affordable and relatively low-cost method to cooperate with other countries.

Generally these projects of territorial cooperation cover the main themes for sustainable development, as environment, education, economy, industry, innovation and others. In depth, the interests for cooperation projects are various and differ for each type of territorial cooperation. For instance, in cross-border, transnational and interregional cooperation the predominant projects are in tourism, environment protection and culture. Transcontinental cooperation is focused especially on economy, education and tourism problems. Referring to cooperation projects at cities level, these tend to concentrate on tourism, culture and education issues.

Continuing the analysis over themes, the EU15 countries are more involved in environment and economic projects. On the other side, EU15-27 are investing in infrastructure projects, both physical

and social; then in tourism and education projects. There is a visible difference between the first fifteen EU countries and the last members belonging to EU.

All parties are agree that territorial cooperation improves the sustainability and create opportunities for socio-economic development. Collaborations between different countries create a flux of information, knowledge, innovations and technology, facilitating the experience exchange in many domains.

Furthermore, these territorial cooperation conduct to economies of scale and create premises for a long run and profitable relationship. Less developed countries have more advantages from cooperation projects because they do not have the resources, or because they are isolated and it is more difficult to be competitive.

Transnational cooperation within clusters implies collaboration between clusters from different countries. These networks of clusters facilitate the transfer of technologies and knowledge, improving the impact on regional development. A part of Romanian clusters are implicated into transnational cooperation, for example with Bulgaria, Serbia, Germany and Hungary. Below, there are analysed the most important transnational cooperation's within clusters.

The project *ID:Wood* financed through the South-East European Transnational Program for Cooperation, gathers 15 institutions and organization from nine countries inclusive Romania, with interests in wood industry. The strategy for this project is referring to knowledge sharing, innovation activity and also on design approach. The objective is to create and develop a transnational network of clusters in wood industry. Through this network is sustained the technological transfer, knowledge sharing, new abilities and competencies on design activity, bringing up innovation capabilities, solving environmental problems, improving companies competitiveness.

Another project *I4Food* was also established for interregional cooperation in agro-food industry, through the Interregional Program for Cooperation INTERTTEG IVC 2007-2013. This project gathers six institutions and organizations from Europe, inclusive Romania. The objective of this project is to stimulate the food industry, making it more competitive and innovative on international markets. In order to achieve this objective, the management team proposed a serial directions: observing the best practices and adapting to the region specifics, promoting the cooperation between clusters of food industry, exploiting new market opportunities, exchanging knowledge and competencies, improving the characteristics of goods and transferring the new technologies.

The international partnership for the *Project Adriatic Danubian Clustering*, gathers nine states from South-Eastern Europe. The priorities of this project, are straighten to tourism, sustainable energy, attractiveness, environment protection, biodiversity, competitiveness, the quality of work-force, research, development and innovation capacity.

Danube region has an important role as Pan-European transport corridor, but also has the advantage of protect the biodiversity and shelter ones of the rarest species of fish and plants. For these reasons, the cooperation dimension has significant impact on the whole region. Improving the competitiveness of the region while preserving the environment, could create many benefits for all involved actors.

Moreover, the European Commission financed another project in this region – *Green Intermodal Freight Transport* through South-East European Transnational Cooperation Programme. This project focuses on the capacity on transport of Danube, aiming to improve the infrastructure, harmonize the legislation and create a system for transport management. In this project are involved nine countries, including organizations, public institutions, companies, universities, commerce chambers and other catalysts. The strategy is centred on a mega- cluster that will manage and promote the green corridors, and micro-clusters that group the local actors and support investments at regional level.

Another transnational project is *Balkan-Mediterranean* Transnational Programme, financed through European Regional Development Fund on the period 2014-2020. This project gathers five countries (Romania, Bulgaria, Greece, Albania and Republic of Macedonia) under the same objectives: competitiveness increasing, sustaining the business sector, facilitating the innovation activity, knowledge exchange, biodiversity protection, technology transfer for waste recycling and developing the management for environment protection. The investment of European Regional Development Fund is around 28,3 million Euro, while the investment of Instrument for Pre-Accession Assistance Fund is around 5,1 million Euro.

The project *Cluster PoliSEE* aims to improve the clusters activity, by adopting strong policies, strengthening the effort of research and development domain, sustaining regional cohesion and cooperation between clusters. This project gathers 25 partners from 11 countries. According to Cluster PoliSEE strategy, partners are guided to adopt a similar vision, while improving the impact of innovation activities and create specialized and innovative hubs. Through this project, the involved countries should become more engaged on cluster policies and innovation strategies.

The programme of the *Local Economic Development in the Balkans (LEDIB)* was supporting the Cluster House project, which intended to create a transnational partnership for cluster promotion. At first, it gathers seven clusters from Serbia, then the programme evolved and it was extended to clusters from Balkan region.

According to its strategy, this project has two directions: one is referring to companies segment and another one is referring to cluster segment. The first trajectory is oriented to small and medium sized companies and it intend to provide consultancy to companies regarding the advantages of clusters membership, market research, business planning and management strategy. The second trajectory is oriented to clusters activity, and is focusing on promoting this concept, organizing events and conferences, preparing also magazines, and working on mapping, informing and advocating for clusters.

In present, this project gathers more than 2000 contacts as companies, clusters, institutes, catalysts, public authorities and universities. According to a study conducted by LEDIB Cluster House, from 2011 to 2014 the satisfaction within clusters increased from 56.22% to 79.38%, while the number of clusters grow from seven to 43 clusters. In the same direction, it increased the number of companies from 315 to 2.457 companies. The strategy for next period is focused on transnational cooperation, sustaining the collaboration between clusters (C2C) and developing joint cluster trainings.

Conclusions

Clusters play an important role on new industrial development. Their members have the ability to become competitive in emerging markets and industries, or to become successfully by escalading in new opportunities in global value chains. Territorial cooperation offer new possibilities for enhancing the sustainable development, competitiveness and convergence.

The decreasing of regional disparities is an essential factor for sustainable economic growth and for the convergence process of Romania with European Union.

Based on the research, we could conclude that in order to improve economic growth and diminish the regional discrepancies, Romania should sustain clusters in their activity and create an adequate economic framework, for encouraging their expansion.

In the next few years, transnational cooperation within clusters will expand more in environment protection, green industry and bio-physics directions. Regarding cities and transcontinental cooperation the challenges are on social infrastructure and education improving.

Transnational cooperation within clusters strength the economic development, stimulate the competitiveness, improve socio-economic conditions and quality of life, contribute to job creation and facilitate the flow of human capital. If these international partnerships could be extended, they could enhance the productivity, social inclusion and cultural interaction, regional prosperity and environmental sustainability.

Abstract

This paper analyses the tendencies of corporate social responsibility (CSR) in the world, EU and Baltic States and reveals the manifestation of CSR practices in foreign and domestic multinational companies operating in Lithuania. We argue that successful implementation and practice of CSR differs in multinational enterprises (MNEs) in Lithuania dependent on the country of origin and can be tested by identifying the relevant factors that explore these practices. The contribution of the paper is threefold. First, the research provides a better understanding and disclosure of the CSR practices and issues in MNEs operating in Lithuania. Second, the paper introduces a concise theoretical framework for comparison of social responsibility practices. Third, an improved understanding of the CSR issues is given and possible development areas are introduced based on identified failings of CSR application. The findings of the research may be useful from a managerial perspective in taking full advantage of the opportunities offered by CSR.

Keywords: Business and society; corporate social responsibility (CSR); comparative study; sustainable development

Introduction

Society is increasingly demanding socially responsible behaviour from the companies, but the companies not always render an adequate response to these needs. This poses a problem as companies while following requirements recommendatory in character do not assume all the importance of social responsibility and therefore rarely takes full advantage of the opportunities offered by CSR.

Whatever business content and format is, the basic idea for it remains unchangeable - to increase profit and ensure the prosperity in business. However, today's businesses can no longer ignore the environmental and social issues. The number of articles in academic and business journals increases where it is agreed that if companies cause (are a source of) problems to different stakeholders and environment, they must contribute to solving or offsetting them (Elkington 1997; Schwartz and Carroll 2003; Brammer et al. 2007; Windsor 2006; Aguilera et al. 2007; Baron 2009; Groves et al. 2011; Remišová and Búciová 2012). Since the business is part of the problem, it must become part of the solution. Globally environmental, social and ethical issues require a new worldview alongside with innovative solutions. Therefore, businesses must include social responsibility in their agenda.

The special role in spreading social responsibility activities must be allotted to multinational enterprises (MNEs). Experienced MNEs often function as a medium for local firms to acquire foreign technology and offset uncertainty (Buckley 2014). To date, experienced MNEs operations have mostly spearheaded the adoption of CSR practices in the Baltic countries. In Lithuania, interest in corporate social responsibility has been growing significantly, but the empirical research in this field is insufficient especially taking into account the influence of multinational enterprises. From our continuous

observations of MNEs growth in Lithuania, we see quite a different picture of domestic and foreign origin MNEs activities considering the research focus, i.e. CSR and its practice. So far, there is limited number of studies that compare foreign MNEs (headquartered in EU and having operations in Lithuania) and domestic MNEs (headquartered in Lithuania and having operations in other countries) regarding differences in their CSR practices. This paper contributes to filling this research gap. Therefore the focus of this study is, while analysing the tendencies of CSR in the world, EU and the Baltic States, to reveal the manifestation of CSR practices in multinational enterprises operating in Lithuania by concentrating the research on the comparative analysis of foreign MNEs and domestic origin MNEs. The study aims to contribute to the knowledge on the spread of CSR ideas and practices in MNEs in Lithuania. First, we present theoretical framework for comparison of social responsibility practices and identify relevant factors that explore these practices. Second, we also disclose social responsibility practices in companies that are determined by different environment, economic development level and social policy by comparing data obtained from primary and secondary sources on domestic and foreign origin MNEs. Then we give some guidelines on CSR improvement areas. The paper also provides a more comprehensive overview of CSR aspects comparing three Baltic States and analysing some Lithuanian companies. This allows the research to identify failings of CSR application and areas Lithuanian companies can benefit more demonstrating broader understanding of CSR. Finally, the results of the empirical investigation may prove useful from a managerial perspective while implementing and improving CSR initiatives in the companies.

The study design is based on a qualitative content analysis of the CSR on the Web sites of 10 biggest Lithuanian companies, company documents, information in mass media, job openings, trade union information, discussions with employees and our own observations. The second part of the research included a series of questionnaires with company executives and managers responsible for CSR implementation in the company and employees.

Theoretical framework for comparison of social responsibility practices

When designing the conceptual framework for the research it is important to identify key concepts, factors and issues that are relevant to the topic and can disclose the phenomenon of interest. Sustainable development is multifaceted and influential concept for business, and deals with the diverse social, environment, and economic issues.

On corporate level, sustainability is implemented through CSR strategy which should define the organisation’s visions, governance, organisational structure and management systems and propose measureable organisational objectives and targets. Therefore, the role of corporate executives cannot be underestimated as decisions, based solely on short-term considerations of shareholder value ignoring the needs of all stakeholders, can lead to difficulties and problems in the long-run term (George 2003; Manning 2013; Remišová et al. 2013). Corporate governance is about mediating varied interests and organisations that focus on their customers and empower their employees to meet customer needs. This inevitably provides greater growth in shareholder value. Furthermore, Early (2002) suggested that the moral and ethical standing of an industry is a reflection of the moral and ethical values of the executives who lead the organisations that constitute the industry.

Stakeholders, especially internal stakeholders, experience the effect of corporate behaviour i.e. they are the recipients of corporate strategy, actions and output. Employees are their most valuable asset and that a firm's ability to retain employees is a hallmark and signal of organisational success (Aguilera et al. 2007; PricewaterhouseCoopers 2007, Wildes 2008). Numerous academic researchers (e.g., Humière and Chauveau 2001; Morsing 2006; Quiroz-Onate and Aitken 2007; Wildes 2008; Preuss et al. 2009; Bhattacharyya 2010; Habisch et al. 2011; Hingley 2010) have suggested the critical success factors for implementation of CSR practices among which include not only a predominant vision comprising CSR,

senior management and board level commitment but an engaged staff too. Clearly, staff participation on the company's CSR aspirations is central to success in this area. The new understanding covers the following key aspects: work life is no longer limited to working hours and the physical presence within the organizational setting but is a critical resource for the creation of the individual identity (Baldry et al. 2007; Bourne et al. 2009).

However, the researches evidence that organizations do not yet approach the issue strategically, and that sustainability or social responsibility in human resource management is ignored (Preuss et al., 2009). This opens a new perspective for research and managerial actions with emphasises on social and psychological aspects such as attitudes, relation to diverse groups of stakeholders, creating secure and healthful workplaces, life-learning opportunities for employees, special motivation programs, inclusion of personnel into decision process, encouraging cooperation, etc. Finally, international law, and in particular human rights, provides a strong basis to develop the required single, standard mechanism for measuring CSR performance (Quiroz-Onate and Aitken 2007; Wood 2010).

Assessing identified CSR development trends in Lithuania and other Baltic States, academic insights on key social responsibility implementation issues and a wide variety of measuring CSR practices, we designed a concise theoretical framework for comparison of social responsibility practices in business. It encompass series of linked relevant factors derived from the academic literature such as: care for environmental issues, human rights, relationships with stakeholders and especially the importance of executives and employees in responsible and effective corporate governance. Accordingly, the survey assessed five important social responsibility clusters: understanding the importance of CSR, contribution to environmental activities, protection of human rights, relationships with employees, and responsible company management (stakeholder perspective). Categories that constitute these clusters we discuss in the methodology paragraph.

Methodology

Study design

The aim of the research was to determine the peculiarities of socially responsible performance in companies operating in Lithuania. We focus on the comparative analysis of foreign and domestic origin MNEs. We argue that successful implementation and practice of CSR differs in multinational enterprises (MNEs) in Lithuania dependent on the country of origin and can be tested by identifying the relevant factors that explore these practices. To achieve the aim, the research began by concentrating on the series of linked relevant factors derived from the academic literature discussed in the section above. Accordingly, the survey assessed five important social responsibility clusters by using a valid and reliable questionnaire. Three criteria were applied for the selection of the sample population. First, the organizations should be multinational with foreign or Lithuanian origin. Second, the company should be large, having over 250 employees. Third, the population was limited to executives and managers responsible for social responsibility and company employees. It can be noted that the governance of companies usually does not include specific CSR position; it is usually supplementary to positions such as marketing, PR, environmental management, personnel development. In order to get a broader understanding of CSR practices, apart from the executives, employees were involved in the survey. They were given an adapted questionnaire.

The first step included the identification of large MNEs based in Lithuania. According to the website of The United Nations Development Programme in Lithuania, the official number of Lithuanian companies in the National Network of responsible business is 67 where 45 of them can be considered as large MNEs. We contacted the country's largest MNEs, ten of which agreed to participate. They are active in different kind of business: insurance, banking, telecommunications, construction, retailing, road building,

and power distribution. Refusal of others to participate in the interviews had different excuses. A few companies claimed that the information requested was secret; in some cases, our questions were considered to be of political origin and companies did not want to take a stand. A half of refusals have been received with an excuse of the lack of time, tight work schedule or responsible employees being away. Such responses evidently demonstrate a lack of interest in CSR.

Apart from the questionnaire, firstly the research involved working with wide a range of different primary and secondary data sources such as: company documents, qualitative data analysis of previous researches (e.g., Astromskiene and Adamoniene 2009; Ruzevicius 2009; Zaharia and Grundey 2011; Dagiliene and Leitonienė 2012; Grundey 2012; Leitoniene and Sapkauskiene 2012), company web sites and other information in mass media, job openings, trade union information, discussions with employees, survey, and our own observations. Therefore, the research was divided into two parts: first part explored companies' websites, other information obtain from mass media and trade unions. Website analysis of the companies under research focused on the comparative study of MNEs headquartered in EU and having operations in Lithuania, and MNEs headquartered in Lithuania and having operations in other countries. The second part included the data obtained from the survey of top managers responsible for social responsibility and employees (questionnaire).

Sample and data collection of the survey

Focus group of the survey consisted of top managers, managers responsible for social responsibility and employees. Ten MNEs were selected for comparative study taking into account the domestic or foreign origin and the size (over 250 employees). We received completed, valid surveys from 20 managers and 152 employees (response rate 52.6%). During data gathering for the survey, the purpose and methodology of the study were clarified for each respondent in the chosen companies and the reason of invitation to participate in this study. The questionnaire consisted of few open demographic questions (company name and position in a company). Twenty-five question questionnaire was extracted from interviewing professionals and study of academic literature. The questionnaire included five clusters. First cluster covered issues related to the understanding of the CSR importance and was divided into three categories: understanding of the concept, CSR aims in the market, and reasons to undertake CSR in a company. Second cluster included issues related to environment and was divided into three categories: how company contributes to environmental activities, if the company has green products / services, what green products / services were introduced into the market. Third cluster reflected the assurance of the employee rights and was divided into four categories: the ways how it is assured, claims the company received concerning the breach of trade, professional, civil, political or other rights, implementation of human rights at the company, attitude towards employees in the company. Fourth cluster covered relationships with employees' issues (working conditions that assure efficient staff performance) and was divided into four categories: labour disputes, staff training, preferences in managing personnel, and employee awareness of implementation of CSR principles in the company. Fifth cluster was related to responsible management of the company and was divided into eight categories: influence on government or politicians for making beneficial decisions to the company, provision of stakeholders with the information on economic, social, and environmental activities, opinion on transparency in the company, allocation of the resources, benefit of CSR to society, benefit of CSR to the company, obstacles implementing CSR, ways of informing society about the company's social responsibility.

The survey was conducted in the beginning of 2014 (January, February). During the survey a total of 172 (20 executives+152 employees) questionnaires were obtained.

Reliability and validity measurement of the questionnaire

The questionnaire was based on an extensive literature review, and was developed through several rounds of iteration. At first, the questionnaire was sent to five experts in the field of the research. After calculating content validity ratio(CRV), CRV of 3 questions was lower than 73 % and content validity index (CVI) was equal to 0.86 that was higher than the standard rate (CVI>0.79). Then the improved questionnaire with 3 omitted questions was sent to the experts again. CVR and CVI were found 75% and 0.92 respectively. In the third phase, internal consistency was used to calculate reliability. Four copies of the questionnaire were distributed and revealed good internal consistency (Cronbach's alpha α=0.81).

Analysis and results of comparative study of companies' websites and documents

The empirical research started from comparative study of the companies' websites and documents in them related to sustainability and CRS activities. First, we compared the websites of foreign MNEs headquartered in EU with their subsidiaries having operations in Lithuania. All the original company websites included the information on company's sustainability or/and responsibility policy and activities, and had sustainability reports. As for their subsidiaries in Lithuania, the websites were similar to their parent companies and showed that they were involved in the parallel social responsibility activities. All the Lithuanian subsidiaries had different awards for fostering sustainability and responsibility ideas, though mass media, trade unions information, and discussion with employees revealed some drawbacks or limitations of this activity, namely reluctance to take on the obligations of the contracts, lack of respect for customers, limited staff empowerment and professional development opportunities. One subsidiary in its website had no link or information concerning social responsibility, only in the "History and awards" section had the notice about awards as the "Best employer of the year" in 2012 and 2013. This is quite a contradictory finding as the employee's responses about the company's human resource policies and practices manifest quite different situation (ignorance of personnel needs, non-transparent employee motivation system, high unreasonable work requirements and loads, etc.). This fact indirectly is also supported by a quite a high employee turnover.

Regarding domestic MNEs, the situation is a bit different. Only one website had information on sustainability (sustainability report). Some websites stated about care for environment, customers and employees, and focus on prevention social projects. The majority of the websites included the information about the integrated management systems that comply with the requirements of ISO 9001, ISO 14001, OHSAS 18001. No information was found about the awards on sustainability or social responsibility. We received quite eloquent information from company documents, SWOT analysis and the employee responses. It testified about different possible improvement areas in organizational structure and operations (rather great hierarchy of management, inflexible goods supply system, neglect of customer expectations) and attitude towards employees and their needs (lack of qualification development opportunities, inefficient work delegation, staff is not introduced to strategic goals, lack of know-how in new technologies, no motivation to be interested in innovations, great work overloads).

A deductive logic suggests a relationship between the lack of information about sustainability on company websites and in documents, and shortcomings indicated by the respondents regarding company operations and human resource policy. This implies quite a formal companies' attitude towards sustainability and social responsibility initiatives as well as towards implemented ISO 9001, ISO 14001, OHSAS 18001 standards because these standards should contribute to the better understanding and practices of CSR principles.

This comparative study revealed differences between foreign MNEs and domestic ones in their approach to sustainability and social responsibility issues. The analysis demonstrates that foreign MNEs have a

positive impact on their local subsidiaries, as they are more involved in sustainability practices (sustainability reports, awards, activities) than the domestic MNEs. Some similarities between the two company types were found as well – namely, possible improvement areas in organizational structure and operations, and attitude towards employees and their needs.

Analysis and results of the survey

The analysis of the survey started from using the data of the first cluster "understanding of the CSR importance" with three categories: 4. understanding of the concept, 5. CSR aims in the market, 6. reasons to undertake CSR in a company. This group had a total of 19 specific questions or select options. Positive responses were analysed, i.e. responses "I agree" or the appropriate choice of option.

In order to compare the EU and LT headquartered companies, percentage of positive choices was estimated for both company groups.

$$p_{EU,i} = \frac{m_{EU,i}}{n_{EU}} 100 \quad , \quad p_{LT,i} = \frac{m_{LT,i}}{n_{LT}} 100 \quad , \qquad (1)$$

where $m_{EU,i}$ and $m_{LT,i}$ denote a number of positive choices or responses to the question i, i=1, 2, .. 19, given by EU headquartered and LT headquartered companies respectively, n_{EU} and n_{LT} denote a number of EU headquartered and LT headquartered companies respectively.

Accordingly, two vectors consisting of nineteen coordinates were obtained

$p_{EU} = (p_{EU,i})$, $p_{LT} = (p_{LT,i})$,

which describe the responses from both groups to the above mentioned categories.

Thus, clusters similarity describes the vector similarity. In order to explore the similarities and differences, three approaches were employed as follows: geometrical, correlation and regression together with the analysis of differences $p_{EU,i} - p_{LT,i}$.

Geometrical approach. Vectors' similarity is defined by their parallelism, i.e. the angle φ between the vectors. This angle was found by the formula:

$$\varphi = \arccos \frac{\sum_{i=1}^{19} p_{EU,i} p_{LT,i}}{\sqrt{\sum_{i=1}^{19} p^2_{EU,i}} \sqrt{\sum_{i=1}^{19} p^2_{LT,i}}} = 20^o \quad . \qquad (2)$$

The found angle value of 20° has proved to be much closer to 0° (parallel vectors) than 90° (perpendicular vectors) degrees. Therefore, it shows that the vectors are quite similar in terms that their coordinates nearly proportionate. This indicates that in both types of groups, the number of positive responses to the questions is rather balanced, but not necessarily equal.

Correlation and regression approach. Among the response vectors p_{EU} and p_{LT} a correlation coefficient of r = 0.64 was obtained that suggests a strong relationship, and it coincides with the result of geometrical approach. The regression coefficient 0.38 of regression equation

$p_{LT} = 0.38\ p_{EU} + 0.43$

shows that Lithuanian-headquartered company executives gave 0.38 times less positive answers than EU-headquartered company executives. Hence, it shows that there is a statistical difference between the approaches of two company groups and this relationship of differences or, in other words, the statistical regularity, is revealed by geometrical approach and correlation coefficient.

Approach by analysing differences $p_{EU,i}$ - $p_{LT,i}$. Table 1 presents the minimum differences between the percentages of positive executive responses in both company groups.

Table 1. Minimum differences of positive executive responses in both company groups.

Question	p_{EU}	p_{LT}	Difference $\lvert p_{EU} - p_{LT} \rvert$
5.1. Make profits	50%	50%	0%
6.4. The need to apply the principles of social responsibility in collaboration with international partners who are implementing social responsibility policy	0%	0%	0%

Thus, only half of the firms in both groups do not consider that the company socially responsible goal in the market is gaining profit (question No 5.1). None of the companies in both groups considers that the reason of socially oriented behaviour is the need to follow the principles of social responsibility when collaborating with international partners that follow social responsibility policy (question no. 6.4).

Similarly, other four question clusters were tested using these approaches. Investigation of these clusters is summarized in Table 2. Here we can see that both the small angle between the vector values and significant values of the correlation coefficient disclose the relationship between the responses of EU and LT headquartered company executives. However, the disclosed relationship does not indicate identity of responses and attitudes, but rather the existence of relationship. The regression coefficients of less than one show that the LT headquartered companies in all clusters gave less positive responses as compared to the EU-headquartered companies.

Table 2. Relationship between answers of EU-headquartered and LT-headquartered company executives.

No. of the cluster	Angle between answer vectors	Correlation coefficient between answer vectors	Regression coefficient
1. Understanding of the CSR	20^{o}	0.64	0.38

importance			
2. Environment	24 ^{o}	0.53	0.65
3. Assurance of the employee rights	20^{o}	0.70	0.71
4. Working conditions assuring staff efficient performance	23 ^{o}	0.78	0.86
5. Responsible management of the company	27 ^{o}	0.74	0.83

It should be noted that the highest regression coefficient of 0.86 is in cluster No. 4 "Working conditions assuring staff efficient performance". Thus, the LT headquartered companies positive responses accounted for 0.86 = 86% of the EU headquartered companies, which is almost the same. It means that both groups of company executives have nearly the same opinion on cluster „Working conditions assuring efficient staff performance". Statistical reliability of this finding is quite strong (the correlation coefficient r = 0.78). The same similarities in the responses of both company groups can also be noted from small angle $\varphi=23^{o}$ between the responses' vectors. Similar conclusions can be drawn about cluster No 5 "Responsible management of the company" as well.

The responses of LT headquartered (HQ) and EU headquartered company executives were also compared to the responses of employees in all the clusters (see Table 3).

Table 3: Relationship between the responses of employees and company executives

No. of the cluster	Angle between answer vectors		Correlation coefficient between answer vectors		Regression coefficient between answer vectors	
	EU-HQ respondents	LT-HQ respondents	EU-HQ respondents	LT-HQ respondents	EU-HQ respondents	LT-HQ respondents
1. Understanding of the CSR importance	26^{o}	37^{o}	0.27	-0.50	0.11	-0.25
2. Environment	38^{o}	37^{o}	0.31	0.07	0.44	0.04
3. Assurance of the employee rights	34^{o}	37^{o}	0.15	0.20	0.09	0.07
4. Working conditions assuring staff efficient performance	31^{o}	16^{o}	0.13	0.81	0.11	0.61
5. Responsible management of the company	41 ^{o}	38^{o}	0.23	0.26	0.27	0.40

Here, a strong relationship exists only in the cluster No. 4 between the LT headquartered companies' employees and executives responses (the correlation coefficient r = 0.81 and the angle φ = 16°). In addition, the positive responses of employees consist of about 0.61 of positive responses from companies' executives.

Whereas in cluster No. 1 correlation coefficient of LT headquartered companies' employees and executive responses was negative (r = -0.50). This testifies that the opinions were opposite.

The relationships in other blocks are weak as correlation coefficients are low and angles values are far away from zero. This implies that employees' opinions according to the responses in all clusters except No. 4 do not correlate with executives' answers.

Summarizing the results of the survey, the deductions can be twofold:

- Regarding executives' responses there is quite a strong relationship between the EU headquartered and LT headquartered companies evaluating CSR. Peculiarity of this relationship is that positive executives' responses of LT headquartered companies consist from 0.38 to 0.86 of positive EU headquartered companies' responses in various question clusters. Therefore, lower correlation coefficient of positive responses of LT headquartered MNEs can be treated as a lower involvement in CSR activities and poorer understanding of its significance.

- Employees assess CSR unlike executives of EU and LT headquartered companies. Correlation of employees' responses with executive responses in all question clusters of EU headquartered companies is weak. Correlation of employees' responses with executive responses of LT headquartered companies is significant only in cluster No. 4. "Working conditions assuring staff efficient performance". Moreover, the peculiarity of this relationship is that the employees gave almost less than a half of positive responses. Accordingly, we can state that no matter where the MNE headquartered is, less than a half of positive responses of MNEs employees in Lithuania, as compared to the executive responses, tend to show lower understanding of CSR and involvement in it. This implies that a strong emphasis on further and deeper development of CSR practices must be given not only by the companies in Lithuania but by the state policy as well.

Finally, the comparative study and survey disclosed differences in the involvement of CSR practices between foreign and domestic origin MNEs. Multinational parent companies from abroad have a positive influence on their subsidiaries and provide an opportunity for them to overcome their home-country-based disadvantages concerning sustainability and CSR activities as compared to domestic MNEs and their approach towards these activities.

Conclusions

The contribution of the paper is threefold. First, the discussion of social responsibility factors, based on the theoretical insights on sustainability concepts for business, gives a tool for better understanding and disclosure of the social responsibility practices determined by different environments, development level of economic and social policy in MNEs. Second, the paper introduces a concise theoretical framework for comparison of social responsibility practices. Finally, the findings of the investigation may prove useful from a managerial perspective while implementing and improving CSR practices in the companies.

The paper aimed to determine the tendencies of socially responsible performance in MNEs operating in Lithuania by highlighting how well the companies are exploiting the opportunities offered by the CSR.

This perspective allowed us to focus on sustainability and social responsibility multifaceted concept and practices in more detail giving a special attention to the social responsibility activities and influence of MNEs. The special role was given to MNEs as they conduct their international operations not only to pursue returns on investment, market expansion and economies of scale and scope but also to use location advantages. Thus, MNEs are not only exposed to diverse environments where they operate but they can influence that environment, generate superior performance in foreign subsidiaries compared with domestic origin firms and at the same time indirectly affect domestic firms and give incentive to innovate their activities as well.

To sum up, the comparative analysis of the company documents, qualitative data analysis of previous researches, company web sites , information in mass media, job openings, trade union information, discussions with employees, our own observations, and survey responses points to some valuable implications, i.e. foreign capital MNEs contribute to the development and promotion of socially responsible activities in Lithuania as their Lithuanian subsidiaries try to follow the policy of the parent companies and seek for the different awards in this area. The limitations found indicate improvement areas for both the companies themselves and the work of state institutions (e.g. National Responsible Business Award committee at Ministry of Social Security and Labour in Lithuania). As for the multinational Lithuanian enterprises, their sustainability and social responsibility practice is still more passive than active. Though foreign MNEs influence local business environment and their subsidiaries in pursue of CSR, domestic MNEs still do not fully exploit CSR practice benefits and see it only as altruism or possibility to polish the image. They do not treat it as a competitive advantage and are reluctant to involve themselves in anything beyond the immediate scope of their operational responsibilities. Therefore, domestic MNEs must improve qualitatively (the management of people and processes) and quantitatively (the impact on society).

Finally, like all research papers, this study is not immune from limitations and future research could expand the present analysis in several directions. The findings of our study stress the need for additional theoretical and empirical research in the area of CSR application and practices in foreign and domestic MNEs. Having in mind the perspective of CSR development, future research needs to be more comprehensive as only one country with the limited number of enterprises received attention in the empirical study. Comparative analysis would be more profound and meaningful if it involved more factors, countries and multinational enterprises and investigated their CSR practices in their home country and abroad.

Project Management Standards

Petr Rehacek, VSB – Technical University, Ostrava, Czech Republic,
perehacek@gmail.com

Abstract

The effort to successfully complete projects or job orders led to the development of various project management techniques and tools. Some of the tools to acquire knowledge are the literary resources dealing with general project management (Bazsová and Křížová, 2011). Other major literary resources include the text of the standards and norms (PMBOK, 2013; PRINCE2, 2009; IPMA ICB4, 2015; ISO 21500, 2012) and their commented issue and handbooks. Project management is followed up by other disciplines, such as the risk analysis, human resource management, portfolio management, programs and many others. Project management is also the focus of many global communities who share their resources and studies. Very up-to-date and practical are the Internet interest and business sites (ScienceDirect.com; pmworldlibrary.net) issuing magazines and publications (Procedia; PM World Journal). Here it is possible to find not only the practical experience of project managers, but also the contributions of trainers and academics. Surveys and data collections already carried out constitute another source of information which is mapping the level of project management, a survey by Ernst & Young (EY) of 2013.

Keywords: management, process, project, standard

1. Introduction

In order to understand the basics of project management it is necessary to define the basic concepts and to become familiar with already established practice and internationally recognised standards. The list of major and recognised project management standards includes the following:

- Project Management Body of Knowledge (PMBOK) from PMI,
- PRojects IN Controlled Environments (PRINCE2),
- IPMA Competence Baseline (ICB),
- Guidance on project management (ISO 21500).

The criterion for the comparison of these standards is the number of certified project managers in the Word (Ondek, 2016):

- PMBOK – about 350.000 certified project managers
- PRINCE2 – about 400.000 certified project managers
- IPMA – about 100.000 certified project managers
- ISO 21500 - the certification process is not used - only as a guide

2. Standard Project Management Body of Knowledge (PMBOK)

The methodology according to the publication “A Guide to the Project Management Body of Knowledge” (PMBOK) from the Project Management Institute (PMI) - the base of the methodology was defined in the 1970´s by the standards of the US Army, which were later adopted to the US industry standards (ANSI). This philosophy was applied to commercial projects and thus PMBOK originated. The basic approach here is the process-based concept of management issues. The current edition is from 2013, marked the Fifth (5th) edition.

Project Definition (PMBOK, 2013):

"A project is a temporary endeavour undertaken to create a unique product, service, or result. The temporary nature of projects indicates that a project has a definite beginning and end."

Project Management Definition (PMBOK, 2013):

"Project management is the application of knowledge, skills, tools, and techniques to project activities to meet the project requirements."

According to PMBOK, PMI recommends viewing the project management in a procedural manner and its methodology aims as covering all aspects of project management. PMBOK divides the management processes into five groups and ten basic areas of knowledge (PMBOK, 2013).

Project Management Process Groups (Figure No. 1) - five groups of project management processes:

- Initiating - decision on project implementation and selection.
- Planning - design, maintenance, and changes to the plan for a successful completion of the project.
- Executing - coordination of resources for the project implementation.
- Monitoring and Controlling - ensuring the achievement of the goals of the project and monitoring.
- Closing - handover of the project to user.

Project Management Knowledge Areas - areas of project management knowledge:

Ten knowledge areas that are used by PMI and applied in practice (Řeháček 2013):

- Integration – describes the processes required for project coordination (plan development, plan implementation, coordination of changes).
- Scope - describes the processes ensuring all the required works.
- Time - describes the processes for the timely completion of the project.
- Costs - describes the processes associated with the approved budget (resource planning, cost estimation, budgeting, and operational cost management).
- Quality - describes the processes associated with quality planning and assurance for a successful completion.
- Human Resources - describes the processes for the efficient use of labour (organizational planning, personnel, and project teams).
- Communication - describes the processes for proper and timely transmission of information.
- Risk - describes the processes associated with searching for, identifying, analyzing and responding to risks.
- Procurement - describes the processes associated with the provision of supplies and services (demand, selection of resources, contractual relationships).
- Stakeholders – describes the proper involvement of all stakeholders participating in the project.

Figure No. 1: Project management process groups according to PMI

Table No. 1: Project Process Group and Knowledge Area Mapping

Knowledge Areas	Project Management Process Groups				
	Initiating	**Planning**	**Executing**	**Monitoring and Controlling**	**Closing**
4. Project Integration Management	4.1 Develop Project Charter	4.2 Develop Project Management Plan	4.3 Direct and Manage Project Work	4.4 Monitor and Control Project Work 4.5 Perform Integrated Change Control	4.6 Close Project or Phase
5. Project Scope Management		5.1 Plan Scope Management 5.2 Collect Requirements 5.3 Define Scope 5.4 Create WBS		5.5 Validate Scope 5.6 Control Scope	
6. Project Time Management		6.1 Plan Schedule Management 6.2 Define Activities 6.3 Sequence Activities 6.4 Estimate Activity Resources 6.5 Estimate Activity Durations 6.6 Develop Schedule		6.7 Control Schedule	
7. Project Cost Management		7.1 Plan Cost Management 7.2 Estimate Costs 7.3 Determine Budget		7.4 Control Costs	
8. Project Quality Management		8.1 Plan Quality Management	8.2 Perform Quality Assurance	8.3 Control Quality	
9. Project Human Resource Management		9.1 Plan Human Resource Management	9.2 Acquire Project Team 9.3 Develop Project Team 9.4 Manage Project Team		
10. Project Communications Management		10.1 Plan Communications Management	10.2 Manage Communications	10.3 Control Communications	
11. Project Risk Management		11.1 Plan Risk Management 11.2 Identify Risks 11.3 Perform Qualitative Risk Analysis 11.4 Perform Quantitative Risk Analysis 11.5 Plan Risk Responses		11.6 Control Risks	
12. Project Procurement Management		12.1 Plan Procurement Management	12.2 Conduct Procurements	12.3 Control Procurements	12.4 Close Procurements
13. Project Stakeholder Management	13.1 Identify Stakeholders	13.2 Plan Stakeholder Management	13.3 Manage Stakeholder Engagement	13.4 Control Stakeholder Engagement	

Source: own modification, PMBOK Guide 5th (2013)

Table No. 1 shows a map of mutual relation of the areas of knowledge and process groups. Process groups are divided into sub-processes marked by PMBOK and are assigned to individual areas of knowledge. The processes comprise the inputs to which the tools and techniques are applied, and those generate outputs that result from the process. A detailed description of inputs, outputs, tools, and techniques can be found in the PMBOK Guide.

3. Standard PRoject IN Controlled Environments (PRINCE2)

The methodology according to the PRINCE2 standard - it is a British Standard owned by the Office of Government Commerce (OGC) and is managed by APM Group Ltd. Process concept of the methodology is based on the assignment of the British Ministry of Industry and Trade, which initially used it for the management of government IT projects. Presently valid guide is the "Managing Successful Projects with PRINCE2™" of 2009.

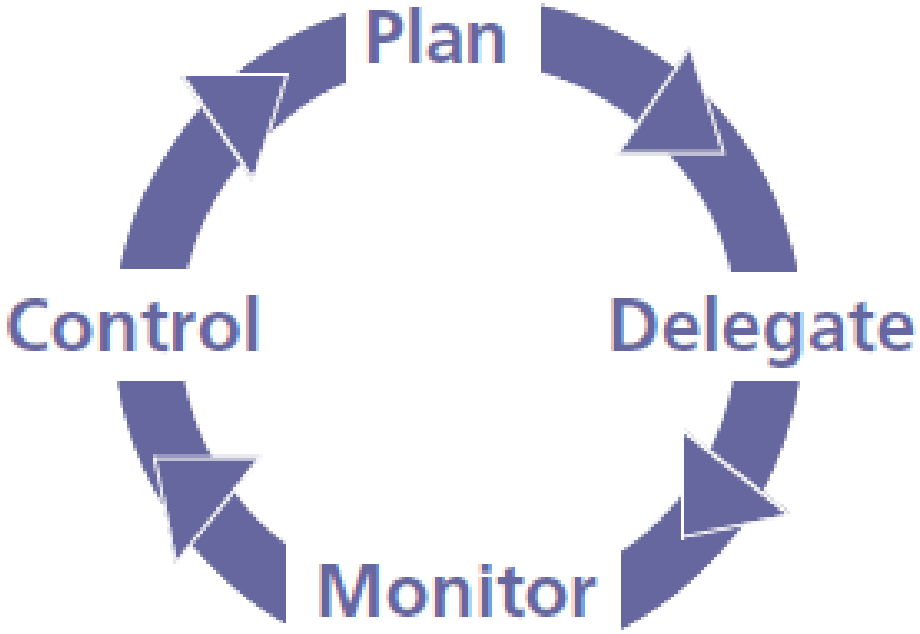
Project Definition (PRINCE2, 2009):

"A project is a temporary organization that is created for the purpose of delivering one or more business products according to an agreed Business Case."

Project Management Definition (PRINCE2, 2009), Figure No. 2:

"Project management is the planning, delegating, monitoring and control of all aspects of the project, and the motivation of those involved, to achieve the project objectives within the expected performance targets for time, cost, quality, scope, benefits and risks."

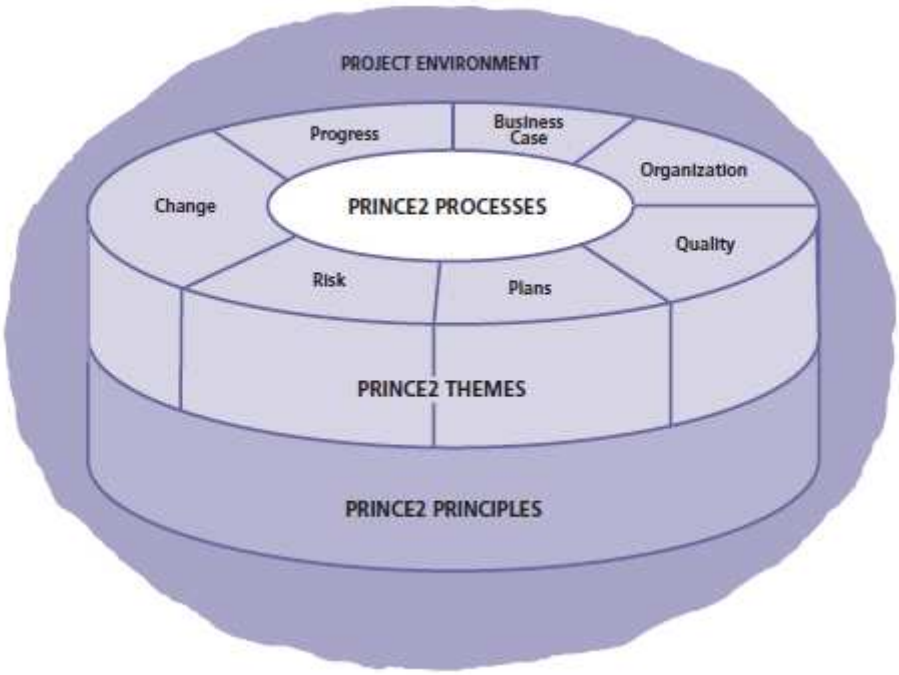
Figure No. 2: Project management



Source: PRINCE2 (2009)

Figure No. 3 shows three integrated PRINCE2 areas in the project environment - the seven principles, seven topics, seven processes *(PRINCE2, 2009 and Tayllor & Cox, 2014).*

Figure No. 3: The structure of PRINCE2



Source: PRINCE2 (2009)

The seven PRINCE2 principles *(PRINCE2, 2009 and Tayllor & Cox, 2014):*

- Continued business justification - constant assessing of the reasons for the implementation of the project.
- Learn from experience - learning from previous projects and documented experience.
- Defined roles and responsibilities – providing a detailed description of the roles for stakeholders.
- Management through stages - planning, managing, and monitoring after successive stages with continuous evaluation.
- Manage by exception - defining tolerance (in terms of time, funds, and capacities) for each defined power.
- Focus on products - focusing on the benefits and delivery of the product within the project (what and how).
- Tailor to suit the project environment - adapting the methodology to the current project environment.

The seven PRINCE2 topics:

- Business Case - consists of mechanisms to assess whether the project is desirable, achievable, and viable. Question: Why?
- Organization - defines the structure of responsibilities. Question: Who?
- Quality - defines the means and implementation of product validation. Question: What?
- Plans – outlines the methods of management to deliver the products. Questions: How, how much, when?
- Risk – defines the methodology for identifying, evaluating, and reducing the amount of risk. Question: What if?
- Change – defines the methodology for identifying, evaluating and managing changes. Question: What will be the impact?
- Progress – defines the methodology for monitoring and comparing actual achievements against planned ones. Questions: Where are we now, where are going, do we have to worry?

The seven PRINCE2 processes:

- Starting up a Project - the process preceding the project run that aims to ensure the prerequisites for a successful project set-up. It is launched by the mandate of the project, which provides the reason, purpose, and quality.
- Initiating a Project – the preparation of detailed and solid plans for understanding the work that needs to be done before it comes to investment in the project.
- Directing a Project – the continuous process that takes place throughout the period of a project. It allows the project committee to take responsibility for the success of the project and issue operational instructions as required by the project managers.
- Controlling a Stage - the process that describes the controlling activity of a project manager.
- Managing Product Delivery - the process of delivering products within the project.
- Managing a Stage Boundary – the completion of a project phase with subsequent control and evaluation of the project status.
- Closing a Project – the completion of the project with the registration of knowledge for a successful management of other projects.

4. Standard according to IPMA Competence Baseline (ICB)

The European standard ICB - was created in the sixties of the last century and is managed by a professional organization entitled International Project Management Association (IPMA). The ICB standard focuses on competences and skills of the project managers and the team members. Standard ICB recommends process steps that are applied to specific project situations. Currently the Czech Republic recognises applicable national standard of project management competences linked to the ICB, Version 3.2, and 3rd edition of 2012.

Project definition (ICB, 2012):

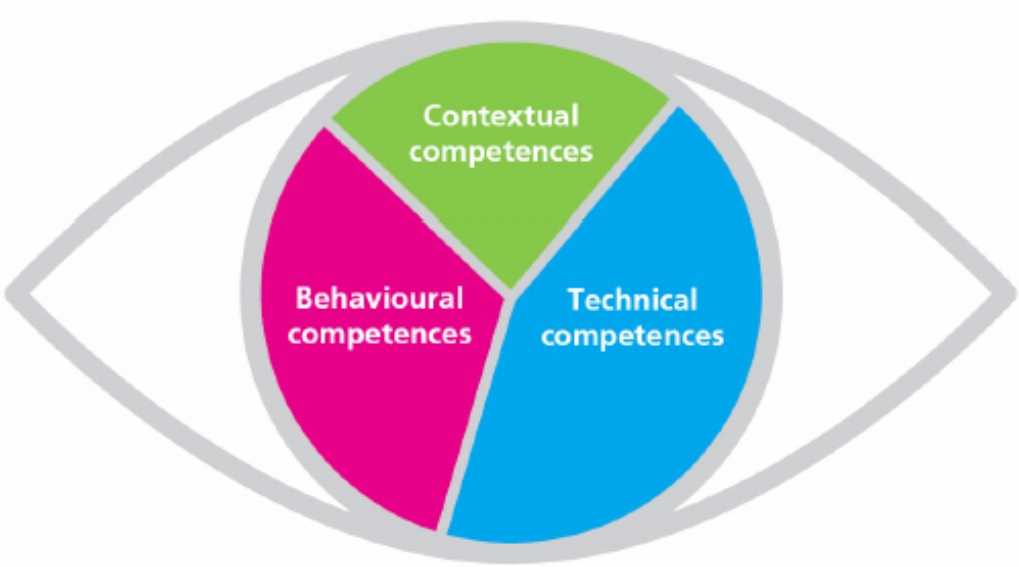
"A project is a process limited in terms of time, cost and resources, implemented in order to produce defined outputs (scope of achievement of the project goals) in terms of quality, standards and requirements. The goal of the project is to achieve a predefined state, which has been agreed in the specific business case.

Project management definition (ICB, 2012):

"Project management is a professional discipline utilizing firmly defined standards and guidelines for the work of employees in the area of project management. These requirements are defined by the acquisition, processing and standardization of the accepted and used project management competencies.

Eye of competences (Figure No. 4) shows the integration of all the components of project management from the perspective of project manager when evaluating a specific situation.

Figure No. 4: Eye of competencies according to ICB



-
Source: IPMA

Table No. 2 shows a list of 46 project management competence activities divided into three areas according to their focus.

Table No. 2: Project manager competences according to IPMA

CONTEXTUAL COMPETENCES
Project orientation
Programme orientation
Portfolio orientation
Project, programme and portfolio implementation
Permanent organization
Business
Systems, products and technology
Personnel management
Health, security, safety and environment
Finance
Legal
TECHNICAL COMPETENCES
Project management success
Interested parties
Project requirements and objectives
Risk and opportunity

Creativity
Results orientation
Efficiency
Consultation
Negotiation
Conflict and crisis
Reliability
Values appreciation
Ethics

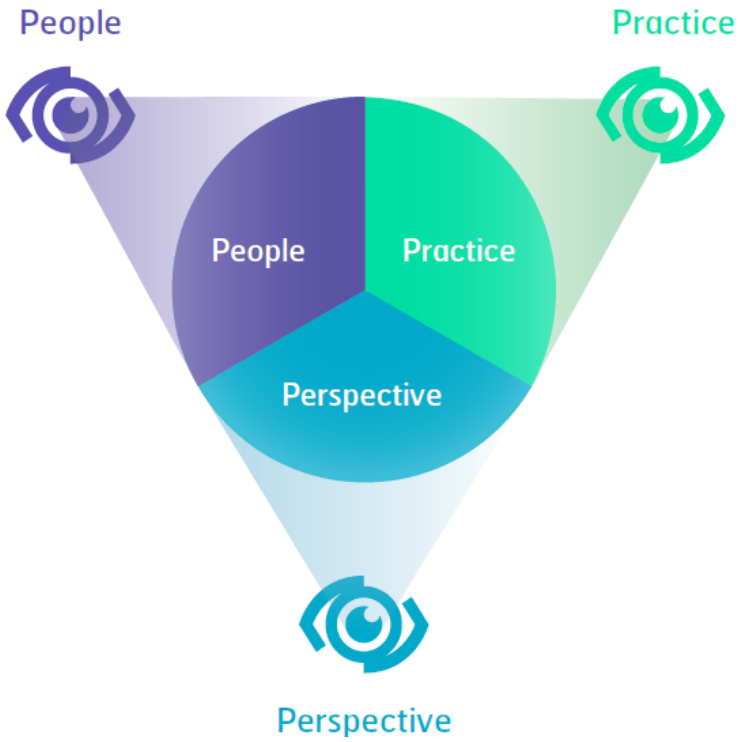
Source: IPMA (2012)

The newly released fourth version of the IPMA standard redefined the Eye of competencies as an area of twenty-nine competencies of a modern project manager for the Project, Program and Portfolio Management. Competencies are divided into three areas: People, Practice and Perspective (Figure No. 5).

- Human skills - include personal and interpersonal skills necessary for a successful participation in or leadership of a project, program or portfolio;
- Practical skills - are specific methods, tools and techniques used in the projects, programs and portfolios in order to achieve their success;
- Prospective competence - incorporate methods, tools and techniques through which individuals act on the environment, as well as the reasons that lead the people, organizations and society to initiate and to support projects, programs and portfolios (IPMA ICB4, 2015).

There is a newly revised definition of the project:
"A project is a unique, temporary, multidisciplinary and organised effort to implement the agreed outputs within a pre-defined requirements and constraints."

Figure No. 5: Predefined Eye of Competencies according to ICB4



Source: IPMA

5. Standard - Guidance on Project Management ISO 21500

This International Standard provides a description of the concepts and processes that represent best project management practice. The projects are included in the context of programs and portfolios of projects, but this International Standard does not provide a detailed guidance on the management of these programs and portfolios of projects (ISO 21500). The latest version of the ISO 21500 standard was released in 2012.

Project definition (ISO 21500):

"A project is a unique set of processes consisting of coordinated and controlled activities with start and finish dates, undertaken to achieve an objective."

Project management definition (ISO 21500):

"Project management is the application of methods, tools, techniques and competences to a project. Project management includes the integration of the various phases of the project life cycle. Project management is accomplished through processes."

6. Comparison of project management standards

To select the appropriate methodology, it is important to reflect on the practical use of individual procedures or combinations thereof. The comparison of the various standards was already addressed by several authors and studies in the past. Below are the summaries of their findings.

Comparison of ISO 21500 and the PMBOK

A simple comparison discovered a great similarity between PMBOK Guide 5th and ISO 21500. The ISO 21500 at its inception was based on the PMBOK Guide 4th released in 2008. A detailed comparison is published in the International Journal of Engineering Science and Innovative Technology (IJESIT) Volume 3, Issue 1 of January 2014, specifically the article entitled "Standards ISO 21500 and PMBOK Guide for Project Management" (Řeháček, 2014). The introduction of ISO 21500 was followed by the publication of PMBOK Guide 5th in 2013, which moved the "Stakeholders" from the area of "Communication" to the area of "Knowledge", which has been a major step to approximation of ISO and ANSI standards. The two systems differ in only a few technical details.

The comparison with other standards can be inferred from the article in PM World Today - January 2012 (Volume XIV, Issue I) entitled "Enhance the PMBOK® by Comparing it with P2M, RBI, PRINCE2, APM and Scrum Project Management Standards". For our purpose, we focus on the part associated with ICB and PRINCE2. The comparison is complemented with new items deriving from PMBOK Guide 5th.

ICB and PMBOK Compared, adjusted by (PM World Today, January 2012):

Matches of ICB and PMBOK:

1. Both guides can be implemented in different ways so as to suit the specific needs of the customer. ICB has forty-six competencies used by the project manager at various levels of the relevant project. PMBOK Guide 5th uses forty-seven processes at various stages in the project.
2. ICB competencies can be applied to the areas of knowledge and groups of processes according to PMBOK.
3. The competencies in the ICB are interrelated, as well as the processes in PMBOK. An output from one process may be used in PMBOK as an input to another process, and equally in the ICB the information from one competency can link to another one.

<u>Differences between ICB and PMBOK:</u>

1. ICB focuses on the assessment of skills and abilities of the project manager and the project team, whereas PMBOK addresses the processes in the project.
2. ICB emphasises behavioural competencies and personal relationships in the team. PMBOK focuses on technical skills.
3. PMBOK defines a project as a temporary effort to create a unique product or service. ICB defines a project as a time- and cost-limited process implemented in order to achieve defined outputs with an emphasis on the quality and satisfaction.

<u>Shortcomings of ICB compared to PMBOK:</u>

1. The capacity to complete the job is more important in PMBOK than the competencies defined in ICB. PMBOK focuses on the implementation of the project.
2. PMBOK sets out detailed tools and techniques for forty-seven processes. An ICB expert must obtain the tools, techniques, and information from other sources. However, this feature provides ICB with a greater flexibility in the present world.
3. RBI places greater emphasis on human skills, while PMBOK puts more emphasis on the procedural skills. However, both skills are important in projects.

PRINCE2 and PMBOK Compared, adjusted by (PM World Today, January 2012):

Matches of PRINCE2 and PMBOK:

1. PRINCE2 defines a project as a temporary organization that is created in order to provide one or more business products according to an agreed business case. PMBOK defines a project as a temporary effort to create a unique product, service, or result.
2. PRINCE2 defines the role of the project manager as oriented on achievement of the project goals within the targets set in terms of the time, cost, quality, quantity, benefits, and risks. PMBOK says that the role of the project manager is to cooperate closely with the portfolio or program manager to achieve the objectives of the project and to ensure the fulfilment of the project plan within the program.
3. The variables are defined in PRINCE2 as time, costs, quality, scope, benefits, and risks. The same variables are identified as project constraints in PMBOK.
4. PRINCE2 topics are comparable with the areas of knowledge of PMBOK. PMBOK also includes the area of public procurement.
5. PMBOK and PRINCE2 process groups are very similar and equal. The only difference in PRINCE2 consists in the process of "Launching of the project", which is not contained in PMBOK.
6. PRINCE2 has forty competency activities that occur throughout the project in a variety of processes, which is comparable with forty-seven processes in PMBOK.

Differences between PRINCE2 and PMBOK:

1. PRINCE2 highlights the key risks of the project. PRINCE2 identifies why projects fail and aims to reduce the failure rate by removing the cause of failure through the management, control, and proper tools and techniques employed. PMBOK aims to increase the success of the project by setting up the processes, tools, and techniques.
2. PRINCE2 places emphasis on product planning. Product Breakdown Structure (PBS), Product Description, and Product Flow Diagram are the key to the product-based planning.
3. In PRINCE2 the control is addressed by approval and division of the project into manageable phases and milestones.
4. In PRINCE2 the technical competencies are intended for specialised tasks and challenges. The management phases are intended for the stakeholders. PMBOK does not make this distinction.
5. PRINCE2 classifies the stakeholders into three categories: Business sponsor, user, and supplier. The commercial sponsors are those who deal with the financial benefit of the project. The users are people who will use the product as soon it is ready. The suppliers provide expertise and resources to the project and then deliver the products. PMBOK defines the stakeholders as entities or organizations that are actively involved in the project, or whose interests may be positively or negatively affected by the course and completion of the project.
6. PRINCE2 introduces and observes procedural structure that can be reduced depending on the project size. PMBOK prescribes tools and techniques at a high technical level, often serving as a performance-based standard.

Shortcomings of PRINCE2 compared to PMBOK:

1. PMBOK includes the processes needed in the area of public procurement. PRINCE2 makes no mention of the public procurement.
2. PMBOK contains detailed information that can be used for each competency that it addresses. Each of these competencies has a dedicated section of tools and techniques with detailed information. PRINCE2 simply lists suitable techniques for the project but does not provide any details in their regard.
3. PMBOK addresses the human resource management with a wealth of knowledge, which includes developing a plan of human resources, acquisition, development and management of the project

team. PRINCE2 provides no information dealing with human resources and human resource management.

4. PMBOK enriches the information regarding soft skills with greater details leading to reduced conflicts and enhanced teamwork, and it highlights the importance of leadership skills for a project's success. In terms of the soft skills, PRINCE2 only mentions that the best educational and training programs should be used for specific environments.

Conclusion

All of the above standards are designed to increase the success of the project by emphasizing various competencies (Bazsová, 2013). PMBOK and ISO 21500 emphasise repeatable processes, ICB emphasises competences and skills of the project managers and members of their teams, PRINCE2 accentuates project product in a controlled environment. A significant change will undoubtedly be brought about by ICB4, which is also extended with program management and portfolio management. The standard newly contains a table of cross-references between ICB3 and ICB4 competencies (ICB4 Annex C, 2015) and also the processes in ISO 21500 (ICB4 Annex A, 2015).

Problems and Prospects of Interaction between Employers and Universities: Approaches to Assessing Employer Satisfaction with Professional Skills of Graduates

Inna Krakovetskaya, Tomsk Polytechnic University, Tomsk, Russian Federation, inna_krakov@mail.ru
Olga Lutoshkina, Tomsk Polytechnic University, Tomsk, Russian Federation, lutoshkina@tpu.ru
Evgeniy Kotik, Tomsk Polytechnic University, Tomsk, Russian Federation, evgenik324@mail.ru
Tatiana Ilyina, Tomsk State University, Tomsk, Russian Federation, ilinatg@mail.ru

Abstract

The paper reviews problems associated with high level of dissatisfaction of Russian employers with the quality of university graduates. We present a methodological set of tools for university executives to acquire information on employer satisfaction with the skills of university graduates and the main requirements to their personnel. The tools also make it possible to identify the forms of cooperation with universities that employers deem promising for increasing the competitive strength of future graduates.

Keywords: education quality, university graduates, methodological tools.

Introduction

In the current conditions of rapidly changing environment and heavy competition, the employment issue becomes especially relevant to all the Russian enterprises and organizations. Employers' demands keep growing, which brings up a question: how can universities train excellent specialists in the Russian education market? It is no secret that only the lazy do not point at the deteriorating Russian education. There is no way to find anyone to blame in this consistent trend. Employers criticize higher education institutions, whereas the latter associate the process with the low level of training offered to future students at schools. In addition, universities argue that they must train high-class specialists rather than superhumans and note overstated demands of the present-day employers.

The analysis of the Russian research findings shows that most employers note low practical competence of students in their professional activities. Of great interest is the research by Sergeeva (2007), in which the author states that, in order to organize practical training in the Russian higher education, we need to overcome a number of problems:

- Unstable social and economic situation in the society;
- No forecast of economic development;
- No field-specific structure of specialist training;
- Disrupted links between universities and employers;
- Underdeveloped labor market,
- Poor influence of professional communities on the development of the educational system.

This is why the problem of finding an effective way of interaction for all the parties interested in improving higher professional efficiency acquires special significance.

A comprehensive opinion poll of employers also shows that the respondents do not only value professional competences of graduates but also their personal qualities that help them to be

practically and psychologically ready for an independent life after graduation. In their research, S.D. Reznik and E.S. Konovalova (2011) speak of the need to make Russian students competition-oriented. This is "special ideation providing their readiness for constant fighting for survival, success and promotion in the modern world as well as mastering the technologies of such fighting".

This approach to training graduates is undoubtedly relevant, because the ability to fight for oneself and one's interests is the only thing that can help future employees survive rigorous vetting including stress interviews, etc., and restore ones strength fast enough for the present-day conditions of severe competition.

Methods

We have developed a set of tools to evaluate employer satisfaction with the quality of training for professional activity offered to students. Originally, it was developed under the project themed "Developing a Quality Monitoring System for Educational Programs" as part of the Program for Competitive Growth among the Leading World Academic Centers.

The main objectives of measuring employer satisfaction with the quality of university graduates are as follows:

- Discovering the main factors that promote employer feedback to the university in regards to the graduate employability.
- Finding out the level of employer satisfaction with the quality of university graduates.
- Finding out the level of employer satisfaction with the comprehensiveness of the graduates' professional, adaptive, operational, communicative, psychological, and informational competencies.
- Identifying the main requirements of employers to the employees of their enterprises and organizations.
- Investigating employers' plans for further employment of the university graduates.
- Discovering the forms of collaboration with the university employers deem promising.
- Detecting weak points in the arrangement of faculty-organized student training for future professional activities; developing recommendations for eliminating these weak points.
- Discovering unused reserves for improving the quality of student training for future professional activities by following employer recommendations.

Elements of the methodological toolset:

1. A system of indicators and profiles of employer satisfaction with employee training quality.

At the first stage of forming a system of indicators, the object of research is structured into sections. For each section, a set of indicators is selected that quantitatively measure the elements comprising the section (see Table 1).

Table 1: Value ranges and employer satisfaction with the quality of university graduates

No.	Value range	Employer satisfaction with the quality of graduates	Indicator mapping
	0 to 20%	Risky	This range corresponds to very low employer satisfaction against a specific indicator.
	20% to 40%	Poor	This range corresponds to poor satisfaction of employer with the quality of graduates, recommending the university executives to address the qualification aspects that resulted in such a low assessment value, since those are the problem areas.
	40% to 60%	Normal	This range corresponds to normal satisfaction, i.e. no considerable problem areas exist, but there are no obvious competitive advantages to make the faculty or main curriculum stand out in terms of professional training of graduates.
	60% to 80%	Good	This range corresponds to the quality of graduates that is higher than average for this indicator.
	over 80%	Advantageous	This range means high employer satisfaction, which corresponds to high-quality training of graduates for professional activities; this range means there is a competitive advantage.

2. Indicator evaluation maps

An evaluation map is a qualitative or quantitative description of the indicator status and corresponds to the value ranges given above. Table II shows the indicators used to assess employer satisfaction with the training quality of university graduates.

Table 2: Indicators of the sections of employer satisfaction analysis with the quality of university graduates

Section of analysis	Indicators
Overall employer satisfaction	Factors that promote collaboration with the higher education institution in terms of graduate employment Satisfaction with the quality of graduates
Satisfaction with the quality of university graduates	Applicability of the knowledge and skills acquired Relevance of the competencies to the qualification acquired Comprehensiveness and sufficiency of the knowledge for practical use
Satisfaction with the adaptive and operational competences of the	Rate of adaptation in a new team Work under high uncertainty and fast-changing specifications Reliability and precision of operations performed

Section of analysis	Indicators
graduates	Speed at which professional skills are formed and changed Ability to use the acquired knowledge and skills in non-trivial situations Ability to recover productivity Time management skills
Satisfaction with the communicative and psychological competences formed in the graduates	Ability to forge relationships in a team Culture of communication within a team Ability to establish contact with customers Business communication (business negotiation skills, business parlance and correspondence) Ability to work in a team Inter-industry communications Customer centricity
Satisfaction with the personal qualities of the graduates	Leadership Creativity and creative potential Aspiration for further self-development Ability to work under pressure Spirit of competition (fight for one's own good)
Satisfaction with the information-related competencies formed in the graduates	Computer skills Leveraging modern technical aids and information technologies in professional problem solving Information handling skills (acquisition, storage, and processing)

The methodology for assessing employer satisfaction with the degree of graduates' readiness for professional activity identifies strong and weak points and performs a gap analysis of each educational program, which will make it possible to find the room for improvement of this process and enhance the competitive performance of the university graduates from the employers' viewpoint.

Many Russian and international researchers assert that the role of employers in training competitive university graduates is very significant and it will be even more so in the future. According to Salimova and Vatolkina (2010), employers are the very people who can assess the competence of graduates by their ability to perform their professional duties in a qualified manner. The first results of testing this set of tools have shown that employers are willing to get involved in the educational process themselves in order to ensure better forming of the practical skills. Over a half of the employers interviewed consider it necessary to involve company staff in the professional training of future graduates. Therefore, when searching for promising forms of interaction among the university and enterprises, it is vital to take into account the opinion of employers.

Conclusion

The set of tools offered will allow identifying the factors promoting the cooperation of prospective employers and TPU in terms of the employment of graduates, determining the degree of the partners' readiness for further interaction in training and employment of TPU graduates, and specifying the forms of cooperation that the employers would find promising.

Thus, the methodology for assessing employer satisfaction with the quality of university graduates' training for professional activity can serve as a basis for determining future forms of prospective interaction between higher education institutions and partner enterprises in order to improve the competitive ability of graduates and improve of their employability within their specialty.

The Impact of Transnational Corporations in Romanian Economy

Gabriela Liliana Cioban, Stefan cel Mare University, Faculty of Economics and Public Administration, Suceava, Romania, gabrielac@seap.usv.ro
Eugenia Iancu, Stefan cel Mare University, Faculty of Economics and Public Administration, Suceava, Romania, eiancu@seap.usv.ro

Abstract

This study develops the topic on transnational corporations (TNCs) and their presence in the Romanian space and their contribution to the development of the national economy sectors. The main objectives of this paper aims to identify the sectors that attracted FDI in our country and the impact they have on the social and economic life (creating jobs, increasing turnover, etc.). To achieve these goals, we collected, processed and interpreted statistical data contained in the various reports and databases. The results show that tax incentives, low cost of labor, geographical location, large internal market and EU accession have made Romania become an attractive country for foreign investors. These advantages have motivated transnational corporations to invest in our country in 2013 in industry, trade, services and a lower percentage in construction. So, transnational corporations are of interest for the Romanian market. In this context the state institutions make efforts to provide a minimum legislative "comfort" for the foreign investors.

Keywords: Transnational corporations, Gross Domestic Product, Foreign Direct Investment, Tax Code.

Introduction

Given the fact that transnational corporations are by definition an economic force, they are often compared to 'nations' themselves. This is from the fact that transnational companies often exceed the economic strength of many countries, some of them even considered developed. Contemporary reality shows that these transnational corporations are the most important businesses in the world, operating in areas such as economy, finance, science and technology, having a strong say in world politics (Munteanu, C., Horobet, 2005, p.99). Globally these companies constitute the main axis of the contemporary economy. About 70,000 of these giant companies with at least 700,000 subsidiaries and affiliates generate one third of global exports, a tenth of global GDP and their share is growing (Voiculeț Alina 2008, p.36) .

Transnational corporations (Joseph E. Stiglitz, 2008, pp.163-171) represent key sources of capital, technology and market access for almost every country. Their activities have a strong impact on the global distribution of wealth and economic activity between national economies. Transnational corporations bring benefits both to the consumers, business and to the entire system (Albescu Oana, 2012). At the same time, it is a high concentration of economic power and, like all forces, can adopt corrupt and socially unfair attitudes.

The competition for these transnational corporations is performed internationally with foreign companies of the same profile, to fill bigger segments of the global market. The emergence, development and maintenance of these transnational corporations internationally were achieved on the background of three main factors:

- Liberalization of economic policies, the opening of national borders, liberalization of the foreign direct flows and portfolio or other investment and cooperation agreements;

- Emphasizing technological progress, which leads to increased costs and risks faced by companies, requires addressing various global markets through international relocation of production to diversify these risks;

- Increased competition, which is actually the result of the other two factors mentioned above, requires the exploitation of new markets by companies, both to reduce production costs and for more efficient use of the final result, but also requires the addressing of new forms of international manufacturing, property and contractual arrangements to protect their market power, such as for example mergers, acquisitions, minority or majority participation, exchange offer, etc. (Bari I., 2003, p. 45)

The genesis of these corporations is therefore in the competition capacities held by them. Being competitive is a major challenge for both businesses, governments and transnational corporations, which have concluded regional agreements.

The advantages and disadvantages brought by transnational corporations

The ability of transnational corporations (Albescu Oana, 2012), to use a variety of instruments concerned - know-how, patents and licenses, new technologies, financial and human capital, logistics, organizational practices, markets and networking globally - in economic activities range as close to the top predator in the modern economic world, if not the actual top.

Romania's accession into NATO (NATO, 2004) and European Union (EU 2007) has led major multinational corporations to turn and look for the opportunity to invest in our country. The first effect was felt by the banking system (which was privatized in 2000) who began to engage more deeply in the domestic economy, opening wider credit tap for a wider category of private companies.

The economic dynamics can be seen just looking at the value (Gross Domestic Product) GDP of Romania after 1990. So from 1991 until 2000 the GDP of our country for 10 years oscillated around 35 billion USD. During 2000-2004, Romania's GDP nearly tripled to 99 billion USD, and later, after another four years, in 2008, Romania's GDP has doubled again compared to 2004, about 200 billion USD. In 2014 Romania's GDP was back to the level of GDP in 2008, the highest level ever recorded in our history.

The entry of transnational corporations on the Romanian market was motivated by the advantages our country presents: cheap labor (too cheap) and qualified in many areas, modest geographical distance compared to European centers, a domestic market of around 20 million inhabitants, a relatively good degree of urbanization, an acceptable existing infrastructure, pre-existing external trade traditions. Also, in some cases transnational corporations conditioned the entry on the Romanian of the granting of temporary tax incentives, the subsidies or state aid in various forms from the Romanian state. Meanwhile the Romanian state continued to spur private sector because it was obliged to provide strong new tax sources in the near future.

Romanian capital development started at its own pace with advances bigger or smaller and inherent gaps in any way. Please note that the development of technology and market capitalization were not likely to create a deep economic dynamic and nor significant and constant revenues to the state budget. From these gaps have benefited transnational corporations that through parent companies from home countries and using companies of financial advice, particularly through accounting methods known, manage to reduce the maximum the income taxes paid in the country in which they operate, being very effective in managing this aspect. This is possible due to fiscal legislative gaps, lack of alertness, lack of proper involvement and attitude from state institutions.

Romania bears the consequences of these gaps today. Suppose the lack of professionalism or abetting known and tacitly endorsed, or on the contrary - for legal commercial reasons with the agreement of state's fiscal structures, or an omission of Romanian fiscal system are the result of appropriate non-taxation profit margins generated by multinationals in Romania. Market competition in terms of private Romanian companies or with state capital clearly suffered the accumulation of resources and capital being unfair, unjust and without regard to the rules of free market.

Despite these legitimate tax inaccuracies or questionable at times, we find that the extra of activities of transnational corporations triggered in the economies in which they operate is prominently manifesting its effects locally or sometimes only marginally (Diana Farell, ş.a.). The economies of developing countries are optimized and upgraded, effervescence of economic exchanges and transfers of technology and management increasing. Resources are often used more efficiently, resulting in multiple effects of driving and related economic sectors. Perhaps the positive consequences are not always uniform, immediate or easily quantifiable, there are risks that these economic giants to generate difficulties and temporary imbalances in the national economic scene, but overall their presence is still desirable. These giant companies with turnovers greater sometimes than the GDPs of countries, act planned and organized globally with an efficiency of envy, being active promoters of the globalization we live today, this system wanted two-way by information, investment, financial flows in which we would prefer to be an active part.

The absence of transnational corporations in an economy often shows only the lack of resources and perspective of a country at a time, the low level of attractiveness of that entity, traits typical of a closed economy and not connected to world economic situation, and as a consequence direct unlikely that the economy / country to generate sufficient and / or immediate wealth to its members.

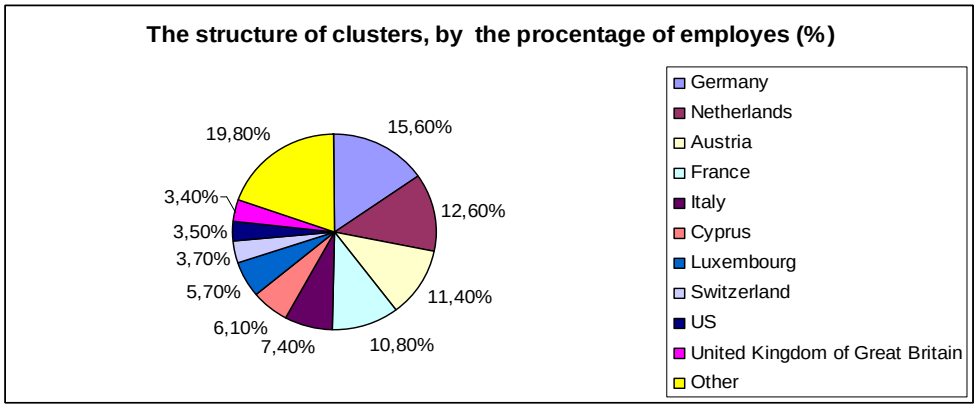
Present and future of transnational corporations

Today, transnational corporations (John Dunning, 2002, vol.1.) / multinational corporations are a massive presence in the global economy, internationalizing services and production. There are many opinions regarding the importance of their development for domestic and international economy. Thus, some economists consider that they have become global corporations and represent positive forces for economic development and prosperity to all corporations, while others believe that a transnational corporation / multinational corporation represents only firm of a particular nationality which organized the production and distribution so that it crosses borders.

Based on these theories (Dunning J.H., 1981, p.3; Dassbach, Carl H.A, 1988, p.7) and benefiting from data provided by the National Statistics Institute (NSI) we see that for Romania (2013) there were identified a number of 44.575 (Press release nr 102/2015) groups of firms operating in the local market, of which 5248 were residents and 39 327 were groups of multinational companies (noting that 60 groups were controlled from the inside and 39 267 foreign controlled groups). In the group of resident companies are those of two or three companies and a group of three enterprises activates in trade, shows the NSI data.

In other words, from the total enterprise groups, the highest percentage of enterprise groups were identified in the section wholesale and retail trade, repair of motor vehicles and motorcycles (31%), construction section (13%), manufacturing section (11 %).

Regarding the group of undertakings resident it is found that 21% of them work in trade, 12% in manufacturing, 11% performing professional, scientific and technical activities and 11% are identified in construction.



Source: http://www.insse.ro/cms/files/statistici/comunicate/com_anuale/grup_intre_ro/grup_intrep2013r.pdf

Graph no. 1. The structure of clusters in Romania, by the percentage of employees (%)

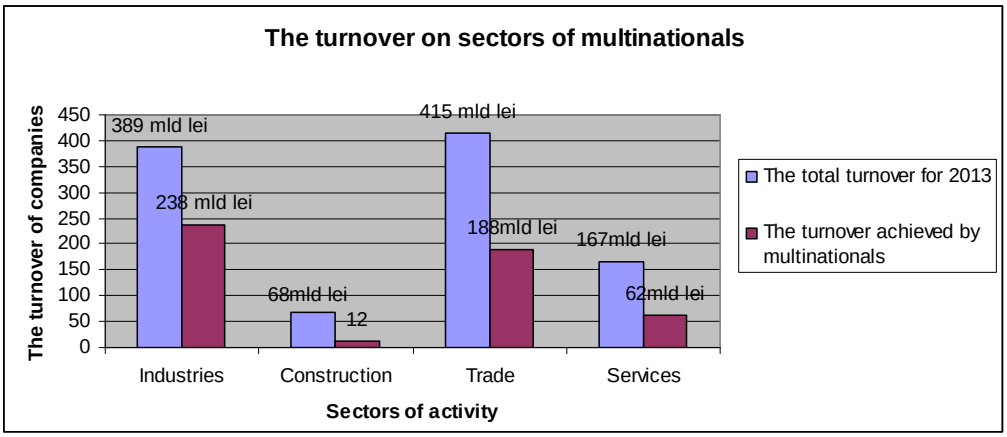
Also, reported to the percentage of employees, most subgroups of enterprises in Romania are controlled from Germany, the Netherlands or Austria. Depending on the percentage of employees, on the first place are subgroups of enterprises controlled by legal entities or individuals in Germany (15.6%), second place are those controlled from the Netherlands (12.6%) and third place are those controlled from Austria (11.4%). (Graph no.1)

Depending on the percentage of total employees in multinational enterprise groups controlled by foreign, the subgroups of enterprises controlled in Germany predominate in manufacturing (7.4%), in the section wholesale and retail trade, repair of motor vehicles and motorcycles (2,5%) and in the section of professional, scientific and technical activities (2.4%).

Compared to subgroups of enterprises controlled from the Netherlands, the statistics show that a percentage of 4.8% are in manufacturing, 2.3% in the section wholesale and retail trade, repair of motor vehicles and motorcycles and 1.5% in section information and communications. Subgroups of enterprises controlled in Austria have a rate of 2.8% in the mining industry, a percentage of 2.4% in the section wholesale and retail trade, 2.4% in repair of motor vehicles and motorcycles and 2.4% in manufacturing section. On turnover of multinationals in Romania in 2014 we find that Germans, Austrians and the French lead in the top, while Bulgarians had a business of 350 million Euros.

Expanding this topic we see that subsidiaries (Zamfir Paul Bogdan, 2007, p. 102) of transnational corporations / multinationals had turnover of 503 billion lei (112 billion Euros) in Romania in 2013, i.e. 48% of the total turnover of 1041 billion lei of all local companies, show Institute of Statistics (Pâslaru Sorin, 2015.10.8). The information on economic indicators - turnover, number of employees and gross value added at factor cost - subsidiaries of foreign companies, are provided by the study "The activity of foreign affiliates in Romania" (www.insse.ro, accessed at 30.01.2016).

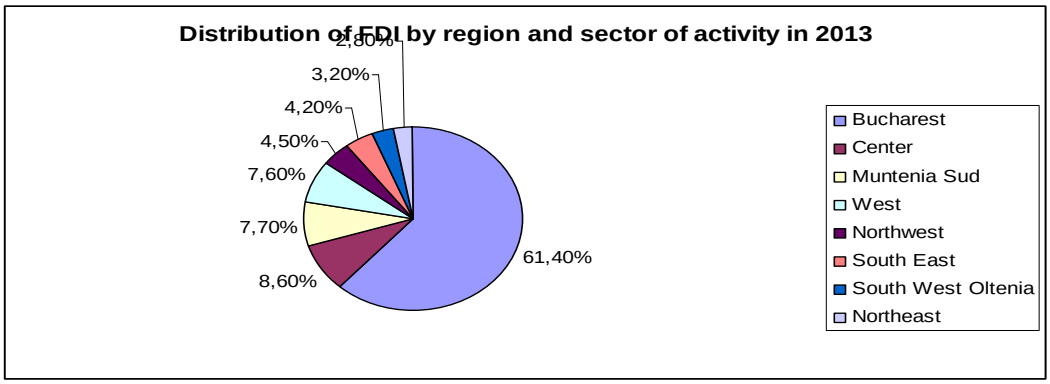
Multinationals have focused mostly on investment in the industry, which now accounts for 61% of the turnover of the companies in Romania. The lowest rate is recorded in construction, 17% of the turnover of the relevant companies in the local market and in trade have a percentage of about 45%, similar to the whole system of local companies. In services, foreign capital represents 38% of turnover (Graph no. 2).



Source:http://www.insse.ro/cms/files/publicatii/publicatii%20statistice%20operative/activitatea%20filialelor%20straine%202013.pdf pag.3

Graph no.2. The turnover on sectors of multinationals

So in the year 2013, 80% of subsidiary enterprises existing in Romania were from European Union and a further 8% in other European countries. The remaining 11% is held by other countries. Statistics show that without the contribution of foreign companies our country would have remained economically to the same level as countries which are not members of the European Union (Belarus, Kazakhstan). In this context it should be mentioned that in 2013, the average turnover for a subsidiary of multinational was about 20 million lei having a staff of 39 employees. Most of the multinational companies operate in services - almost 10,000 companies, in trade are found 8,000 companies, in the industry are active 5000 companies and in constructions develop their activity 2,500 companies.



Source: BNR and INS, foreign direct investment in Romania in 2013

Graph no.3: Distribution of FDI by region and sector of activity in 2013

Distribution of investments by region and sector was oriented mainly towards developing regio Bucharest-Ilfov (61,4%); Central, South-Muntenia, West and North-West also benefit from FDI but in much smaller proportions (Graph no.3).

Please note that FDIs were territorial located after the FDIs registered office, which does not always correspond to the place of the economic activity. According to the National Classification of Economic Activities (NACE Revision 2), the activities of wholesale and retail trade, repair of motorvehicles and motorcycles and manufacturing section hold the largest share of the turnover of

the subsidiaries of foreign companies in Romania. The lowest value was recorded in computer repair work and personal and household goods. (Table No. 1).

Table No.1 The main indicators of foreign subsidiaries divided by activities

Activity according NACE Rev.2	Number of FATS enterprises (foreign subsidiaries in Romania)	Average number of employees	Turnover (million lei)	Gross value added to the cost factor (million lei)
Extractive Industry	129	24522	20519	11351
Manufacturing Industry	4316	495989	183488	36406
Production and supply of electricity and heat, gas, hot water and air conditioning	444	13529	29176	8270
Water supply; sewerage, waste management and remediation activities	198	12095	5744	1107

Source: http://www.insse.ro/cms/files/publicatii/publicatii%20statistice%20operative/activitatea%20filialelor%20straine%202013.pdf

Statistical data show that in wholesale and retail trade, repair of motor vehicles and motorcycles, the largest share of the turnover was recorded by FATS (Foreign Affiliates in Romania) enterprises of "wholesale except motor vehicles and motorcycles trade", and it was 56,9%. In manufacturing industry in 2013 the highest share of turnover (28,9%) was held by enterprises operating in the "manufacture of road transportation motor vehicles, trailers and semi-trailers", followed by those operating work in "metallurgy" (7,9%), and those who work in "food industry" (7,7%).

Making a complete picture of the presence of multinational companies on the Romanian market is filled with turnovers volume carried by them, the number of employees and the number of existing enterprises. Thus, German companies have been in business of 77 billion lei (17 billion euroof which: 7,4 % in manufacturing industry; in the section of wholesale and retail trade, repair of motorvehicles and motorcycles 2,5%, and in professional, scientific and technical activities section 2,4%) in 2013, had about 170,000 employees and were operating in 2600 enterprises.

Regarding the controlled enterprises subgroups in the Netherlands, 4,8% are in manufacturing, 2,3% in the section of wholesale and retail trade, repair of motorvehicles and motorcycles and 1,5% in

information and communication section. Subgroups of controlled enterprises from Austria dominate in extractive industry (2,8%), in the section of wholesale and retail trade, repair of motorvehicles and motorcycles (2,4%) and in manufacturing industry (2,4%) (INS, 2015, Press release, no 102).

In an analysis of the activities of the former socialist countries we see that Hungary has conducted business in Romania of 11.4 billion lei through 1350 companies followed by Czech, which registered a business volume of 3.9 billion lei through 131 companies. Poland has set up in Romania a total of 147 enterprises doing business for 2.7 billion lei and with 5,100 employees, and Bulgaria has business of 1.6 billion lei in Romania which are handled by 328 companies (table no. 2).

Source:http://www.insse.ro/cms/files/publicatii/publicatii%20statistice%20operative/activitatea%20filialelor%20straine%202013.pdf

[1] Is an enterprise with legal personality controlled by another, directly or indirectly, and control is defined as having a stake of more than 50% of the total shares of a company. The main indicators analyzed in this phase are: number of enterprises, turnover, number of employees and gross value added.

[2]Is the total value of goods invoiced, resulted from sales of goods, merchandise, performance of works and services, minus rebates and other discounts to customers

[3] Represents the amount of wages and other elements related to the cost factor, profits, operating grants, the amortization of fixed capital, of which is subtracted the taxes linked to production.

Interest in both countries integrated in the European Union and countries outside the European Union to do business in Romania is apparent from their need to use financial, managerial and marketing resources and the need to form new corporate culture. Romania's attractiveness towards investors stems from the fact that currently Romania's policy on foreign direct investment is based on three main issues: equal treatment for Romanian and foreign investors; free access to markets throughout the economy and minimal government intervention in economic activities. Also, the Finance Ministry is considering a wider national strategy, at the opportunity it will provide the new Tax Code and the new Code of Fiscal Procedure to protect companies operating in Romania, to provide a framework equal and fair operating and to ensure a minimum "comfort" in which to become more competitive and more profitable in the long term.

Conclusions

Transnational corporations investments (TNCs) in our country have turned on during 2013 in a substantial proportion on the wholesale and manufacturing. Given the geographical distribution of FDI, we notice that in all these years, Bucharest-Ilfov region attracted the largest share of investments, while the north-east part of the country had the lowest percentage. A justification for this can be given by the quality of infrastructure and available labor force.

These transnational companies have the means to compensate the actual capital shortage in developing countries being the main factor for development. Besides providing financial means, transnational corporations stimulate productivity and economic efficiency, modernizing the economy. A strong presence of STN sites and a large stock of Foreign Direct Investment (FDI) is desirable because the more powerful their presence, the faster the developing countries "catch up" on developed ones. Modernization process may be accompanied by inequalities. These are not necessarily caused by activities of STN and foreign capital, but are inherent to the process of transition. At a higher stage of development, these inequalities of development will disappear, which justifies STN activities, even though they will inevitably lead to some social inequalities. This refers to "growth first, then redistribution".

In our opinion, Romania will continue to be attractive for foreign investors, since it has highly skilled labor and production costs are lower than in other EU countries. However, it is likely that the disparities between regions in terms of value of FDI attracted to constitute a sensitive issue in the next years. The analysis of these issues could be an interesting topic for a future research.

Certain Aspects of Decision–Making per Rollam in Limited Liability Companies in the Czech Republic

Abstract

The legislation concerning decision-making "per rollam" (which appropriately translates as "by letter" in English) is not new in the current Czech law, law on decision-making per rollam has been incorporated within the Commercial Code, namely in its provision § 130. It can be stated that the current Business Corporations Act (hereinafter referred to as the "BCA") clarifies and specifies the issue. In general, amendment of the same in the new Civil Code is stipulated in § 158, paragraph 2. According to this provision, it is possible that the founding legal act indeed acknowledged decision-making of the authority - outside of a meeting - in written form or via the use of technical means. The body of a legal entity can implement adoption of such a decision either at meetings or beyond them, either in written form or via technical means. However, in both cases, it is always the decision of an organ of a legal person.

Keywords: limited liability Company, decision-making per rollam / by letter, decision taken outside of a general meeting

Introduction

Decisions taken beyond the confines of a general meeting according to the BCA (decision-making per rollam) literally mean "a decisive circular, in the form of a circular, in writing". It might be tempting to think that a decision made in this way does not equal a decision confirmed at the general meeting, but merely one made by individual partners beyond the confines of such an authority. Interpreting it literally by its grammatical expression would lead to the following argumentation. If, indeed, it is a decision stemming from beyond the confines of a general meeting, it surely cannot go on to be considered as a decision at a general meeting, the latter representing the organ of the company. Nevertheless, attention needs to be paid to the express wording in the provisions of section 175, para.3 of the BCA. Specifically, the phrase applied is "proposal for a decision of the general meeting". It is the opinion of the author that such phrasing clearly indicates it is a decision made by the body of a company. The argumentation given above creates leeway for discussion. However, the author leans towards the second perspective, namely that decision-making per rollam represents a decision of the supreme body of a company, one which has been arrived at beyond the confines of a general meeting.

The author wishes to address the specificities of this method of decision-making. It is her aim to highlight the advantages and potential disadvantages of utilising this legal institute.

The author focuses on current valid and effective legislation, including professional articles and publications that address the matter. Analysis of the text of the law is performed, through which the author provides an overview of fundamental aspects in applying this legal institute, as well as outlining any potential positive and negative elements.

1 Differences between legislation in the Commercial Code and BCA

In relation to the matter of decision-making per rollam, i.e. outside of a general meeting, the scope of legislation is not extensive; however, it represents an important aspect in the functioning of a company with limited liability. It provides an option to take a decision without the need to actually call a general meeting. Whether a limited liability company chooses to take advantage of this option given by the law is up to the firm in question. Each individual company with limited liability should consider if this legal institute and its practical usage under circumstances of ordinary operations of the company is of benefit. This consideration should be based on particulars such as the number of partners the company has, whether it is simply a domestic entity or if foreign partners are involved, thereby complicating participation at a general meeting. Legal issues affecting decision-making per rollam have also been deal with by Caska (2014), Dvořák (2014), Gregorová a Spodniaková (2014), Holejšovský (2011), Schelleová (2014), Schindler (2013), Šperl (2015) and Žíla (2014).

Legislation contained in the Commercial Code acknowledged that a limited liability company could take a decision outside of a general meeting, but did not stipulate further. As Schelleová stated, allowing decision-making per rollam was mandatory, therefore, associates could not prevent it. In contrast, the legislation stipulated in the BCA allows for the possibility for such decision-making under the condition that this is not excluded by the given social contract. Consequently, it is at the discretion of the partners whether to take advantage of it in the future, or if such an option is voluntarily made void in the association agreement. Should an association agreement be silent on the issue, i.e. does not prohibit nor expressly permit it, the possibility exists to accept as de facto any decision pertaining to the competence of the general meeting. One obligation of a limited liability company is to declare a list of partners, which is enshrined in the provisions of § 139 of the BCA. This ensures that such a business possesses an overview of its associates. These arrangements should prevent circumstances of a partner not being informed about decisions per rollam in the prescribed manner. The person entitled to convene a general meeting must send a proposal for a decision of a general meeting to all partners on said list, to the addresses detailed therein or in another manner that is specified by the association agreement.

2 A decision per rollam and the association agreement of a limited liability company

A decision per rollam possesses certain qualities, which may under a particular circumstance simplify adoption of a decision arrived at by the supreme body of the company, one pertaining to a situation where not all partners are able to attend a general meeting. One argument might be that, for such an instance, they could arrange some form of representation. However, if a company wants to enable all of its partners to participate in adoption of a business decision, then solely the institute of decision-making per rollam is at their disposal. From the literal wording of the law “if the association agreement does not exclude decisions outside of a general meeting”, it would be worthy of consideration for such situations. Simply put, either a company excludes decision-making beyond the confines of a general meeting in its association agreement or it does not. The association agreement can address the matter, in relation to usage of said method of adoption of a decision in various ways. 1) A foundation charter makes no reference to the possibility of decision-making per rollam, i.e. it is mute on the issue. According to the BCA, in such a situation, it is possible to take decisions that fall within the competency of a general meeting in this manner. 2) A foundation charter specifies certain matters related to a company and pertaining to the competency of the general meeting which cannot be resolved by a decision per rollam. This would mean that a company rules out this method for adopting decisions concerning particular areas of interest, whereas any remaining issues can be decided outside of a general meeting. The fact that an explicit negative definition of a radius of affairs exists actually infers that said company allows decisions per rollam, albeit not universally. If the given partners decide to amend the association agreement to permit this method for decision-making by specifically defining issues that should not be resolved thus, then clear consent is given to apply decisions per rollam in others, i.e. unspecified conditions essentially, but those pertaining to the competency of a general meeting. Should the association agreement not even include such a formulation, which would otherwise explicitly admit a decision per rollam elsewhere, it is possible to arrive it by logical deduction. 3) An association agreement explicitly excludes the possibility of

adopting a decision per rollam. Hence, all decisions falling under the competency of the supreme body of a company must arise from a formally convened meeting.

3 A form of decision-making per rollam

The BCA has dropped, from the strict requirement contained in the Commercial Code, the form of expression of individual partners' party to a draft decision to be adopted outside of a general meeting. In adherence with the Commercial Code, the fundamentally respected form demanded was one of a notarial deed, if this form was required for said decision of the general meeting. The BCA, apparently in an effort to simplify and weaken this manner of decision-making, merely demands official verification of a signature. It follows that the form of such a decision of the general meeting can take two expressions, depending on whether a general meeting shall meet or the issue shall be decided outside of the general meeting. For the former of the two, if the decision is taken directly at the general meeting, it is necessary to progress towards making a notarial deed on said decision. If the company chooses to make decisions beyond the confines of a general meeting, it is sufficient to possess officially verified signatures on statements from the given partners to the proposed decision of the general meeting. If the association agreement does not exclude decision-making per rollam, provision for implementation of this method by the technical means stipulated in § 167, paragraph 2 of the BCA can be applied. However, conditions for the use of such technical means must be amended to facilitate verification of the identity of the voting partner, and to determine the corporate shares which are associated with the performing right to vote.

4 Deadline for comments to a proposed decision of a general meeting

The law sets a deadline of 15 days for partners to express their opinions to a proposed decision of a general meeting. If partners do not regulate the period in the association agreement by way of derogation, then this period applies. It can be assumed that in the case of a private arrangement within a foundation charter, the intention would be to prolong this time limit. The deadline should take into account that the partners must become familiar with documentation they receive on the decision. Concurrently, their opinions must be returned to the body that sent out the proposed decision within the specified time limit. Therefore, the legal time limit of 15 days could prove insufficient, in particular when sending out documentation to partners abroad. In the case of non-compliance with the time limit, i.e. an opinion of a partner is delivered following expiry of this period or the partner has not commented at all, the assumption would be that the partner does not concur with the draft decision. It is an irrefutable legal presumption of disagreement by the partner.

5 Content requirements for consent from a partner

The consent of a partner for a proposed decision of a general meeting, one from outside of a general meeting, namely per rollam, must be given completely and unconditionally. The partner cannot give consent with reservations, conditions or various additions. They are unable to create limitations or make other changes relating to their consent. If this occurs, such consent is not given unconditionally and represents a rejection of the proposal. This could be viewed as a disadvantage of a decision per rollam. The partner does not have the capability to come up with proposals, amendments or any counter-proposals, such rights only being permitted in the event a general meeting is convened. The law does not confer such a right when making a decision per rollam. The reason for this is obvious. If the law allows, via a decision per rollam, counter-claims, amendments or the option to make suggestions, the whole process of decision-making becomes highly complicated and prolonged. It is hard to imagine under such circumstances that it would be possible to comply with the statutory time limit for feedback. Even if an association agreement significantly extends such a deadline for expression, it would entail further steps on the part of the body which is competent to convene a general meeting. When large numbers of partners are involved, this actually constitutes a complication requiring the need to send out any counter-claims to all the partners. The question is what to do with the consent from partners delivered to the company in the meantime. The author believes this somewhat reflects - when making a decision per rollam - that the rights of the partners are restricted, as compared to those enjoyed at standardly convened general meetings.

6 Notarial deeds versus officially certified signature

The existence of the institute of decision-making per rollam is an attempt to respond adequately to the real needs of business corporations in normal, everyday operations. For companies with foreign partners and statutory authorities, this can be enormously difficult to achieve, necessitating that such bodies are connected with sufficient notaries and able to make an appropriate judgement. Decisions taken beyond the confines of a general meeting are essentially a huge simplification. This is provided, however, that the right does not apply to companies with a sole partner. Such simplification is visible in the waiver from requirement for compliance with the form on a notarial deed that is necessary for expression of a partner concerning a decision of a general meeting.

7 When a proposed decision of a general meeting is an eligible proposal for a decision per rollam

The duty of the person authorised to convene a general meeting (in the limited liability company it is typically a company executive) is to ensure that a written proposal for a decision per rollam is accompanied by all the necessary supporting documents. These documents can be virtually anything that might influence the opinion of a partner. These could be contracts, bank statements, relevant accounting documents, and so on. If as part of a proposal, one necessarily falling outside of a general meeting, these documents are totally lacking or some are missing, this could not form an eligible basis for expression by a partner.

8 Summary and conclusions

Limited liability is a status conferred on many companies in the Czech Republic. Such a business may possess only one partner or several partners. A general meeting is the recognised authority of the business that decides on its existence and operation. A fundamental right of its partners is that of participating in a general meeting and voting on recommendations. Legislation clearly defines the rules for calling a general meeting and the venue for the same. These obligations must be met so as to ensure it is not possible to successfully launch a challenge against its resolution as being illegal. The topic that is addressed in this paper, i.e. decision-making per rollam, is a potential means of adopting a decision of the supreme body of a limited liability company. It stands as a decision of a general meeting, which is, however, realized outside the general meeting. In other words, a general meeting is not convened in the manner prescribed by law; hence the partners do not meet personally at a specified date and time. A decision making per rollam is therefore a method of decision making when the general meeting does not take place. This means that members of the general meeting comment on the draft of general meeting within the allotted time. Deciding in this way has its advantages and disadvantages. The main advantage is saving the financial resources associated with the meeting. Another advantage is the possibility to participate in the decision making of general meeting in a situation when it would be unable to attend in person. A possible disadvantage is the fact that members of the general meeting have not the possibility of raising direct questions, they expressed only on the draft, whether they agree or disagree. The possibility of decision-making per rollam is not a new legal institute. The Czech legal order had utilised this legal institute at the time of the effectiveness of the Commercial Code. Nevertheless, such legislation contained in the BCA concerning this mode of taking decisions adds particulars and can be said to simplify matters. This is especially true with regard to the fact that comments from partners to a proposed decision of a general meeting might not take the form of a notarial deed, as an officially certified signature shall suffice. Should the company, for this reason, fear a possible misuse of this legal institute, it has the option to explicitly exclude the possibility of decision-making per rollam in its association agreement. Under such circumstances, it would not be possible to practically implement this institute and a general meeting would have to be duly convened in order to arrive at a judgement. A limited liability company also has the option to amend this issue in its association agreement by way of departure from the statutory regulations; for example, by defining specific issues that facilitate making decisions outside of a general meeting. For other matters, it would be necessary to duly convene a general meeting.

A topic for discussion may be the question of whether a company with limited liability may, in its association agreement, tighten provisions concerning the use of this legal institute compared to the legislation. Specifically, this relates to continuing to require the self-expression of a partner pertaining to a proposed decision of a general meeting in the form of a notarial deed. Here it is crucial to determine whether a statutory provision is mandatory or not. Such determination may be a problem in certain cases. Indeed, the issue of determination might represent, due to current Czech amendment to civil and commercial law, a separate topic. The author is of the opinion that it is not a dispositive provision; hence it is not a possible derogation.

An important fact is also the option to file a proposal for annulment of a decision taken outside of a general meeting. The law provides for submission of a proposal for annulment as a subjective period of 3 months from the date the claimant knows or could have known about its adoption. The objective time is set at the length of one year from adoption of such a decision. The expiry of an objective or subjective deadline inhibits the right to submit a proposal for declaration of annulment of the given decision.
The obligation of a limited liability company or a person entitled to convene a general meeting is to announce adoption of a decision per rollam, specifying the date of said adoption to all partners without undue delay from the date of its adoption.

Abstract

Czech and Slovak Federal Republic on January 1st, 1993 split into the Czech Republic and Slovak Republic. Even though, it can be stated that in the field of public administration, and not only here, the development in both countries shows a number of common features. This fact offers considerable possibilities of comparison and analysis resulting from the determination of the particularities of chosen areas of both independent countries which previously fell under one federal government. This article deals with delegated powers and their performance at the municipal level and in view of the significant scope of this problem it may be useful introduction for subsequent analysis. Structure and applying of delegated powers can also be seen as an important instrument of government policy. On the example of two separated countries, we demonstrate that despite of many benefits which decentralization brings, the scope and the way of performance of transferred competencies remain questioned. The aim of this paper is to outline basic differences in the municipal structure and in performance of delegated powers in both countries and build the foundation for further research in this area.

Keywords: Czech Republic, delegated powers, public administration, Slovak Republic

Introduction

After the fall of communism in 1989, countries of Central and Eastern Europe went through, large-scale reforms in economic, social, political fields as well as in the field of public administration. Neshkova and Kostadinova (2012) defined the situation as follows: "*The transformation of the public sector after 1989 has aimed to consolidation of the democratic processes and to enhancement of the economic development.*" Czech Republic (CR) and Slovak Republic (SR) were established on January, 1st, 1993 partitioning the Czech and Slovak Federal Republic and in context of principle of continuity and reception; both newly formed republics have adopted most of constitutional laws of the former Czech and Slovak Federal Republic in force at the date of dissolution of the federation. Constitution from 1992, inter alia, define the structure of public administration (PA), and divide power into legislative, executive and judiciary in both republics. After the dissolution of Czechoslovakia, the countries began to form in various directions in some areas. The legislative power is represented by bicameral parliament in CR and unicameral parliament in SR. Executive power is represented by president, government and prosecutors in both republics, the difference is in a model of governments (PA). While in CR, there is an integrated model of PA, in case of SR, there is a dual model of PA. Judicial power is represented by systems of courts in both republics.

What countries have in common is called continental public administration system which is based on the bureaucratic model of functioning of the administration with close links to legislation. Public administration produces public services and meets social needs in the public interest. Administrative activities are mainly financed from the public budgets and manage public property. Current public administration system is built by two main subsystems: state administration and self-government. Both are represented by two tiers; however, they differ since state administration in CR is represented by central tier and regional one and in SR the state administration is built on central level and district one. Self-government administration in SR and CR has formally the same 2 tier structure – regional self-government and local self-government; however the subordination toward the state administration is in the compared states different. CR is divided into 14 regions in which operate regional offices and approximately 6,250 municipalities with local and municipal authorities, or in the case of statutory towns it is co-called "magistrate" which is municipal authority with particular status. SR is divided into 8 regions and 2,891 municipalities. 2 towns (Bratislava, as the capital city

according to Act No 377/1990 Coll., as amended and Košice according to Act No 401/1990 Coll., as amended) have particular status as well. Among the self-governing organization in CR and SR can also be included interest and professional associations, as well as universities. Both subsystems represent essential elements in implementation of government policy and regulation. CR as well as the SR is unitary and democratic state having the rule of law, electoral system, state symbols and national symbols. SR and CR are members of European Union, Visegrad Group, United Nations, NATO and other international organizations. Given the aim of this paper, in next sections we will further pursue the local self-government in both countries.

1 Statement of a problem

1.1 Local Government in the Czech Republic

Local government is ruled and controlled by specific authorities distinct from the state. Apart from professional and interest chambers, in the self-government in CR is represented by municipal and regional system (local self-government). In 2000 - 2003 local governments underwent major reforming processes related to decentralization and abolishment of state regional authorities, which represented devolved state government. Local government currently performs, beyond its agenda, certain tasks in delegated powers. Its position is enshrined in the seventh head of the Czech Constitution and specified by the following laws: Act No.128 / 2000 Coll., on municipalities (Municipal Establishment), as amended, Act No.129 / 2000 Coll., on regions (Regional Government), as amended, Act.131 / 2000 Coll., on the City of Prague, as amended. Municipality is defined as a basic self-governing territory and public corporation disposing of its own property, rights and responsibilities. Municipalities act within their original and delegated powers. An example of autonomous powers may be issuing generally binding regulations, area of security, culture, public policy, management of municipality, cooperation between municipalities, imposing fines. Performance of delegated powers is partly subsidized by a contribution from the state budget and it is governed by laws and regulations. Basic municipal bodies are the council, mayor and municipal authority (office), having their own characteristics, according to the type of municipality. System of self – governed regions was restored in 2000. In every region there has been established a regional office, which was delegated the performance of transferred state administration, but also the performance of the regional self-government. As a part of transfer to regional system, there was a need to implement new legislation on municipalities, regions, local elections, finances and other standards related to renewal of regions. Regions in CR have different populations and different economic power. According to the Law on Regions, the region is publicly managed autonomous community of citizens, which performs original and delegated powers.

1.2 Local Government in the Slovak Republic

The self-administration in Slovakia is represented by two tiers – local and regional. Local self-government is composed of differently sized municipalities (from 8 to over a half million of citizens). Each municipality is according to the Act No 369/1990 Coll. on municipal establishment, as amended, defined as an independent self-governing and administrative unit of SR, associating the citizens having permanent residence at the municipal territory. Municipality is a legal entity, which in accordance with certain acts, has a right to independently dispose of own assets and own incomes. The second tier of the self-governance – regional level of self-administration, was created in 2001, by adopting the Act 302/2001 Coll. on the self-government of the Higher Territorial Units, as amended. The decentralization process, in the condition of Slovakia started in 1999-2000 by adoption of 2 strategic documents (Strategy of the Reform of PA (1999), Conception of Decentralization and modernization of the PA (2000)), however the real transfer of competences started with the validity from 2002-2004 – it means that the municipalities perform their competences within original or transferred scope. Each municipality, at the own territory issues generally binding regulations (GBR), depending on the scope. In the frame of original competences, the municipality can issue the GBR according to their needs. In the frame of transferred competences, the municipality can issue the GBR only if certain act allows so. The original competences are funded by the municipalities' incomes (own incomes + share on taxes) and the transferred competences are funded by the state's subsidies.

According to above mentioned act on municipal establishment, the municipalities' authorities are municipal council and mayor. The council can establish other permanent or temporary committees.

1.3 Government Policy and Decentralization, Deconcentration

Among the concepts having close connection with this paper belong decentralization and deconcentration. It should also be noted that the level of centralization / decentralization and deconcentration / concentration is closely connected with the political system and can be considered as an important instrument of political regulation. Therefore we consider very important to clarify these terms since the literature recognizes different understandings. As stated by Zan Oplotnik (2013), decentralization does not feature any common consensus of how to standardize the different systems of decentralization of individual countries. According to Nižňanský, Hamalová (2014) decentralization can be realized by several ways: as a transfer of powers to local self-government, as a deconcentration of tasks, transfer of responsibilities to non-state agencies and privatization, which is being applied at all the three levels (central, regional, local). In the case of decentralization it is the delegation of powers and responsibilities from central government authorities to local self - governed authorities. Deconcentration takes place within the hierarchy of state government, where there is also a delegation of authority and responsibility but only in the hierarchy of state' government offices. The forms of public administration are connected (or dependent) on political organization of the state. In case of some forms of dictatorship or totalitarianism, public power is concentrated in hands of one individual or group and is centralized. If it is a democratic state arrangement, it is possible to talk about the decentralized public authority in state. As concludes the author Oates, (2005) if both, decentralization and centralization are performed accordingly, it brings the required outcomes: *"Centralization allows a greater coordination of policies (i.e., the internalization of interjurisdictional externalities), but decentralized decision-making promotes accountability"*. In the conditions of Slovakia, the authors, dealing with the decentralization are mainly Nižňanský, Žárska, Tichý (Kozovský), Klimovský, Papcunová. In a research study by Tichý (2005), decentralization is understood as a need resulting from the changed conditions of economic system, although many of the European countries have introduced the redefining of the tasks and methods towards more efficient performance of PA. In the case of EU new member countries, the need to decentralize resulted also from the pre-accession requirements and from adopting ion of the EU Charter of PA in 1999:*"local self-government denotes the right and the ability of local authorities, within the limits of the law, to regulate and manage a substantial share of public affairs under their own responsibilities and in the interests of the local population"*. The impact of decentralization has been discussed by many domestic and international authors. Authors Smith, H.J. and Keith D.R. (2016) see the success of decentralization as highly dependent on the "vagaries of local leadership". At the international conference known as "Global forum on local self-government", was in 1998 adopted definition: *„decentralization is a process, which helps to improve the governing in the state by allowing the decision-making to be closer to the once touched.* Číž (1998) mentioned that *"process of decentralization represents creation of opened self-government, acting transparently, responsibly and in cooperation with the civil society*". The decentralization contributes to optimization of the differentiated demand due to capability to adapt to local requirements more flexibly, however the implementation of decentralization itself must be realized in regard to each state's individual conditions.

2 Methods

This paper analyses the impact of decentralization process on the performance of the transferred competences in Czech and Slovak Republic and points out main ways in which both governments set up this field. This paper also brings a base for the further research. In the paper, we use initial statistical data of domestic statistical databases (Statistical office of CR and SR). The initial data were further processed and filtered in excel program, using the basic excel functions (filtering, summing, selecting, commanding). The methods of induction and deduction are used especially when drawing the conclusions. The method of description contributes to picturing of the current statement of the solving problematic. The paper uses also methods of comparison of the governments of the two states and method of analysis of the performance of the transferred competences in regard to the legislation. The research sample covers identified transferred competencies and their performance by local levels

in both states. A closer focus is devoted to the competence "construction order", which practical implementation and effective performance by local levels is questioned. This statement is demonstrated by picturing spatial dispersion of municipalities associated into the Joint municipal offices using the method of Geographic Information Systems (GIS).

3 Problem Solving

CR, as well as SR, struggles with high level of fragmentation of local structures. The general finding that "expenses per one citizen decrease with the increasing size of municipality1" is also proved by Governmental Office of the SR in the research study: Strategy of the Reform of Public Administration in Slovak Republic (1999). The following table demonstrates and compares the level of fragmentation in CR and SR.

Table 1: Overview of the structure of municipalities in SR and CR according to the number of citizens

	SR in 2014				CR in 2014			
	No. of Municipalities	In %	Cumulatively in %	No. of citizens in %	No. of Municipalities	In %	Cumulatively in %	No. of citizens in %
Up to 199	385	13,32	13,32	0,9	1455	23,29	23,29	1,72
200-999	1516	52,44	65,76	14,5	3370	53,94	77,23	15,33
1 000 - 1999	575	19,89	85,65	14,9	745	11,92	89,15	9,86
2 000-4999	280	9,7	95,33	15,38	412	6,59	95,74	11,88
5000 – 19999	96	3,32	98,65	15,1	208	3,32	99,06	18,14
20 000 – 99999	37	1,28	99,93	16,9	58	0,93	99,99	22,31
Over 100 000	2	0,07	100,00	22,32	5	0,08	100	20,76
In total	2891				6253			

Source: own calculations based on Statistical offices of the SR and CR, 2015

The table above demonstrates the situation with fragmentation of local structures in the both republics. In general the situation is very similar. However we can conclude that a little worst situation is in Czech Republic, where there is a larger share of small municipalities with less than 1 000 inhabitants. From the point of view of the character of population stricter, the situation is also similar. As states JÜPTNER (2006), in the municipalities with up to 1 000 inhabitants live 17% of the Czech population. In Slovakia, in such small municipalities live 15,6% of Slovak population.

3.1 Delegated Powers at Municipal Level in CR

Delegated powers are ruled by municipalities (municipal office or by special authorities) in the name of state and the most important body of the municipality council cannot, in most cases interfere. Municipal council or its commission may, within the delegated powers exercise under specific conditions, a small amount of activity. Into the field of delegated powers thus falls what is defined by law as a state administration entrusted to municipalities. This article deals with delegated powers on municipal level, Koudelka (2007) divides in the case of CR on this basis municipalities to:

[1] Economy of scale

- All municipalities in CR

All municipalities in CR are entitled to perform delegated powers at basic level. Municipalities are referred to as First Level Delegated Powers Municipalities

- Municipalities with the Registry Office

In addition to the basic delegated powers, municipalities' also perform registry agenda.

- Municipalities with the Building Office

- Municipalities with Authorized Municipal Office

These are municipalities that perform agenda connected with Registry and Building Office with associating agenda. These municipalities are called Second Level Delegated Powers Municipality.

- Municipalities with Extended Powers

These, are also municipalities with authorized municipal office and they are referred to as Third Level Delegated Powers Municipality. Always it is a statutory town and selected districts in Prague.

- Statutory City

It is a city with a special status. For example, these cities can divide their territory into the districts. Statutory city, unlike other cities, must elaborate its energy concept under delegated powers.

- City of Brno with special delegated powers

- Prague with the powers as a region

The Ministry of Interior of the CR and the Statistical Office of the CR include among the municipalities with a higher level of delegated powers those - with portals of Czech POINT (about 5 700 municipalities) conducting vidimus and legalization (about 3 900).

Transferred powers are therefore delegated in basic range to all municipalities, while the Ministry of Interior of the Czech Republic in a document from 2012 called Analysis of the performance of the state administration in municipalities with a basic extent of delegated powers (with configuration) raises some doubts regarding the performance of delegated powers for small municipalities. *"Dispersal of delegated powers to the large number of local authorities undoubtedly increases the costs of the performance of that competence, since it is not possible to use the respective skilled professionals for higher number of cases, or will need to resign this specialization, which leads to the problem of ensuring professional performance competencies listed above".* In case of autonomous powers it is generally appropriate for decision-making process to be as close to the citizen as possible. The question is, if negative phenomena is disregarded (corruption, personal interests), how effective is decision-making process in case of specific agendas associated with delegated powers, which is usually carried out by specialized personnel. The above mentioned Analysis of performance of state administration generalises the benefits of bigger communities: *"Generally speaking in terms of personnel and institutional assurance of delegated powers is being applied that the bigger is the community, the cheaper are the costs for performing of specialized management agenda (economies of scale). This also requires higher specialization of individual officers for different agenda and better performance of delegated powers."*

3.2 Delegated Powers at Municipal Level in SR

The legislation governs, that the municipalities in Slovakia are obliged to perform the transferred competencies only in regard to 2 conditions:

- The competence was transferred by law
- The performance of the transferred competence is reimbursed by the state

The competencies were transferred gradually to municipalities from 1.1.2002-1.4.2013 in the following fields: General internal administration (Registry offices), Environment (Landscape

protection), Regional development and tourism, Social aid, Education, Transportation, Health, Territorial decisions and Construction order.

In this article we would like to stress out that despite the similar level of fragmentation between the Czech Republic and Slovak Republic, and other similar features and conditions for decentralization, the process was implemented in the states differently. The weakness of decentralization of competencies in Slovakia is the lack of size categorization of municipalities, when over 400 competences were transferred to every municipality *en bloc* with no reference to their size.

4 Discussion

The way the government delegates competencies to lower levels of public administration is important act of government policy. Following table compares the share of municipalities performing the given competencies in size categories in CR. The situation is compared with the Slovak republic which absences the size categorization and supplements it with intermunicipal cooperation by establishment of Joint Municipal Offices (JMO). These JMO are established upon agreement and are not anyhow governed by law.

Table 2: Share of municipalities according to Czech size categorisation

	CR **Municipalities in %**	**SR** **Municipalities in %**	
Municipalities with the Registry Office	19,7%	36,25%	Given by act No 416/2001 Coll.
Building Office	9,9%	15,6%	198 JMO 253 individual municipalities
Municipalities with Authorized Municipal Office	6,21%	11,1%	173 JMO 147 individual municipalities
Municipalities with Extended Powers	3,3%	100%	Not specified in SR

Source: own processing based on Koudelka (2007) and SO SR, 2015

The table above divides the municipalities according to Koudelka´s (2007) division and points out the differences in share of municipalities performing the given competencies. Since such a division absences in SR, the shares were calculated from the accessible data. The table demonstrates that the share of municipalities in Slovak Republic is in all the categories higher. As mentioned above, all the municipalities in Slovakia are equal – in order to be able to perform the given competencies, some of the municipalities associate into the JMO, mainly in the field of construction order performance. Only in the case of registry office; the Slovak legislation empowers concrete municipalities responsible for the performance of the competence. In contrary, the Czech legislation, during the decentralization process, introduced the size categorization by two acts: Act No 313/2002 Coll., on municipal order, as amended and Act No 314/2002 Coll. on the appointment of municipalities with a delegated municipal office and on the appointment of municipalities with extended competence. The fact that the legislation appoints concrete statutory cities (Act No 128/2000 Coll., on Municipalities (the Municipal Order), as amended by Act No 273/2001 Coll., Act No 320/2001 Coll., Act No 450/2001 Coll., Act No 311/2002 Coll., and Act No 313/2002 Coll.) and municipalities with authorized municipal office and municipalities with extended powers (Act No 314/2002 Coll. on the appointment of municipalities with a delegated municipal office and on the appointment of municipalities with extended competence, as amended) prevents the small municipalities from inefficient performance of “money consuming” competence (e.g. building order – requires skilled

and educated employee). In the Slovak republic, according to the Constitution and Act No 369/1990 on municipal establishment, the municipalities shall finance its own needs only (par. 7) and not the needs of the state. In this case, since the state's subsidies for the performance of the transferred competencies are not sufficient, the municipalities breach the law by using own sources to finance the state's competencies. This statement proves Nižňanský and Hamalová (2014) in their study: the difference among the incomes and expenditures for execution of the transferred tasks was negative in 5 out of 6 areas: citizens' registry – 38,6%, specialized construction office – 32,5%, building order – 30,8%, environment – 56,2%, regional education – 10%, the only surplus was in the area of Registry Office + 6,7%. The most common possibility the municipalities use, in order to decrease their costs for the performance and in order to avoid the enormous spending for the performance of transferred (sometimes even original) competencies are the mentioned JMO's associations. Despite, the possibility to associate is governed by the Act on Municipal establishment, it is voluntarily based and municipalities associate only in the most costly competencies (construction order, education) due to their fear of loss of their autonomy and power or possible amalgamation in the future. From the mentioned results that the initiative has to come from the government and as stated by Marišová et all. (2013), in connection with the Europe 2020 strategy, it is necessary to continue in the reforming process at the local level. The voluntary principle causes that the large municipalities which should provide "supporting" function to small municipalities have no will to associate since they are able to perform the competencies on their own. In the following part of this article, we demonstrate the effects which result from the voluntary based option to associate into the JMO. We are mapping the comparison of two regions (higher territorial units): Nitra region and Prešov region. In the case of Prešov higher territorial unit it is almost 50% of the district towns, which do not associate in performance of the construction order. In case of Nitra region, it is only 15% of district towns.
The comparison is provided on the following maps:

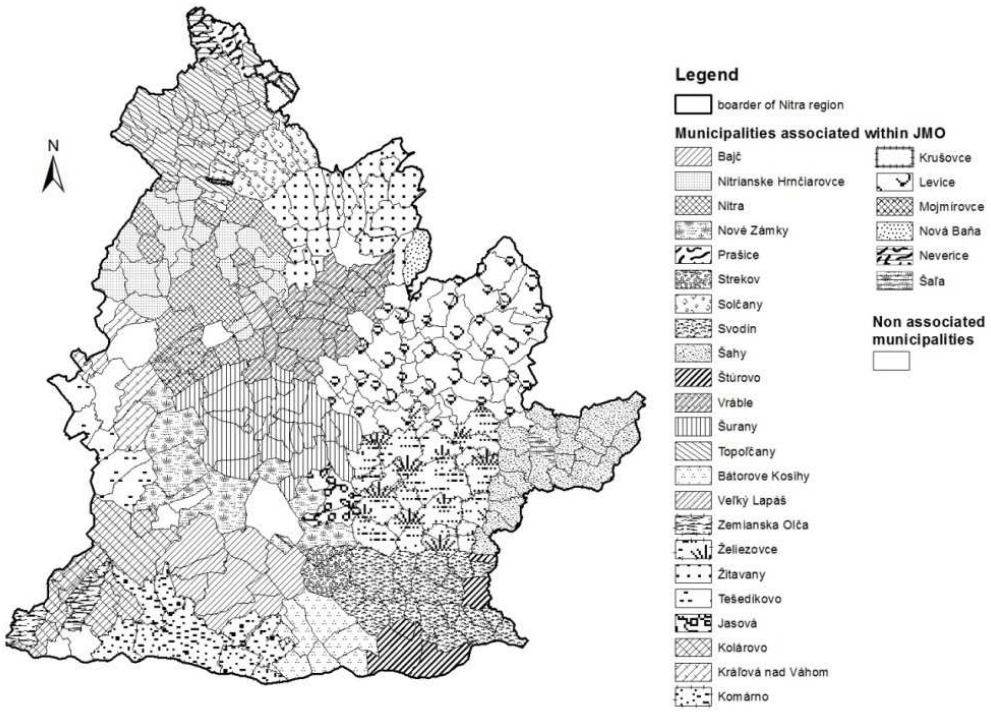

Figure 1: Municipalities, associated within the Nitra region into the joint municipal office in the field of construction order

Source: *own processing*

The only district town, within the Nitra region which has not associated is the town Zlaté Moravce. The district town was the seat of the common office until 2013, but the associated municipalities have

created the office in the nearby village Žitavany (2km from Zlaté Moravce), since the performance of the construction order by district town was for the municipalities too expensive.

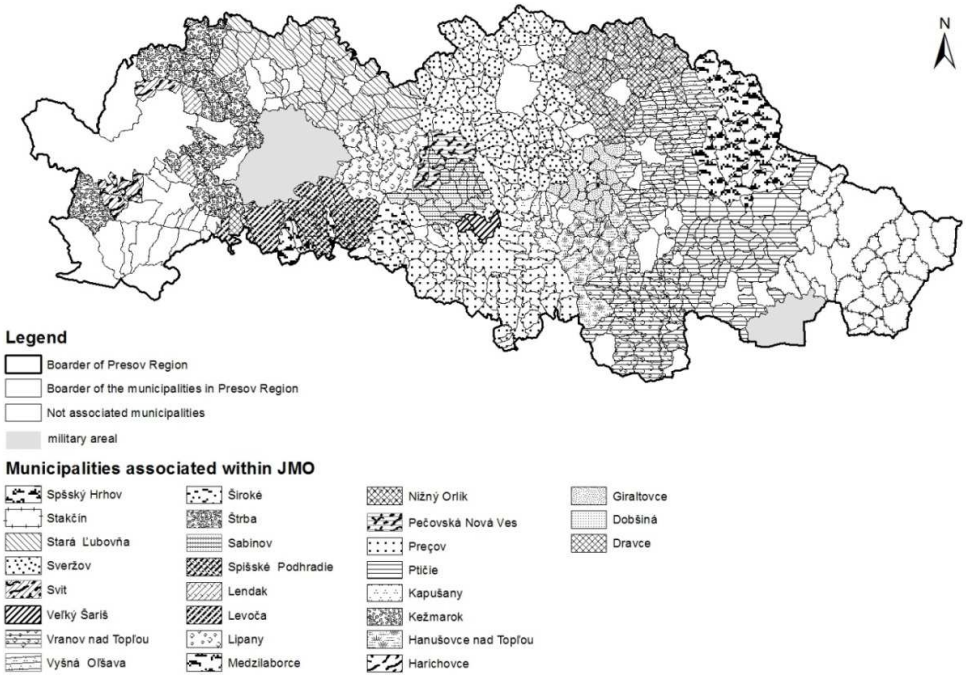

Figure 2: Municipalities, associated within the Prešov region into the joint municipal office in the field of construction order

Source: *own processing*

The municipalities in Prešov region, are mainly associated within the district. The number of members of joint JMOs is various, e.g. in Poprad, there have associated 9 municipalities into two JMOs, in Prešov there have associated 95 municipalities into 5 JMOs. In comparison to Nitra region, the only district town which is not associated is Zlaté Moravce, in case of Prešov region it is 6 out of 13 district towns: Bardejov, Humenné, Poprad, Snina, Stropkov, Svidník – which do not associate. Some of the district towns, such as Bardejov, Humenné, Snina a Stropkov, rent their premises to associated municipalities (JMO Sveržov, Ptičie, Stakčín, Vyšná Oľšava) what means additional costs for rent. On the other hand, the small municipalities associate or sometimes are forced to associate in a not efficient way as demonstrated on the following picture:

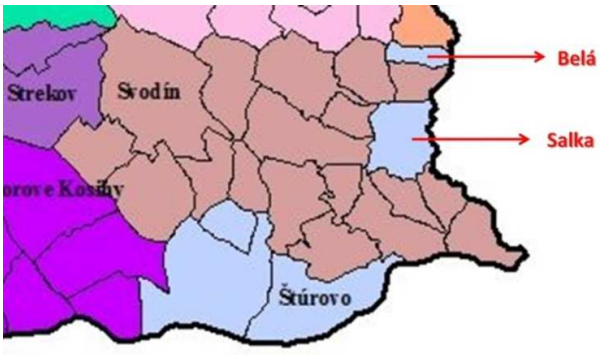

Figure. 3: Example of inefficient associations, JMO Štúrovo

Source: Gresova (2014), 2015

In fact, some of the municipalities associated into the JMO Štúrovo (Belá and Salka), must overcome unreasonable distances in order to submit the building agenda. Therefore, we see a need to unify the situation and possibly to motivate with example of the situation from Czech Republic conditioned by deeper research.

Conclusion

Main aim of this paper is to point out the approach of the Governments of the Czech and Slovak Republic to the issue of performance of transferred competencies and make the introduction to further research in this area. Decentralization of competences from state to municipalities and higher territorial units was in the both republics realized at the same time (2000-2004). While in SR, the execution of all the transferred competencies is left upon the decision of the municipalities, in CR, during the decentralization were the municipalities categorized, since it was clear from the beginning that some of the competencies, such as construction order, require competent and skilled employees which not every municipality, especially small ones, can afford. The Act No 314/2002 Coll. on the appointment of municipalities with a delegated municipal office and on the appointment of municipalities with extended competence explicitly points out the municipalities in Czech Republic, which are delegated to perform certain competencies (including construction order). Such legislative governance ensures all the small municipalities to have equal access the competence and facilitates the performance since it requires highly educated and skilled professional. At the same time, the probability that the performance will be more professional is much higher (at the offices, where more people are employed, there is also possible a specialization of persons in certain area). It is possible to say that currently in CR is being opened discussion about how and to what extent the performance of delegated powers is effective in case of smaller municipalities. Unfortunately, in the case of Slovakia, the option of simplifying the performance of transferred competences in the sense of intermunicipal cooperation - to associate into the Joint Municipal Offices - is voluntary and municipalities often associate in ineffective and inefficient way. Therefore, it is recommended to continue in the reforming process in both states. It could be considered as very beneficial to motivate with example from CR and to possibly modify the option of division of the municipalities into categories differentiating in the performance of the individual competencies.

Abstract

The article deals with the multi-criteria evaluation of gifted students. Students were evaluated with nine criteria: level of learning quality, logic thinking, creativity in spoken and written expressions, broad vocabulary application, text comprehension, knowledge of school subject, reading, speaking, activity and motivation. The research problem is how to evaluate these multicriteria into one final outcome. The fuzzy logic was used for evaluation of gifted students. The advantage of fuzzy logic comes from using of vague variables and settings of weights of importance in used evaluation process.

Keywords *gifted student, evaluation of gifted students, fuzzy logic*

Introduction

The giftedness is described as an individual's ability, which is quantitatively and qualitatively more developed in comparison with their peers, in a specific area valued by the socio-cultural environment (Heward 2013). According to Porter (Porter 1999), these definitions may acquire more concrete form in connection with their conception. It may be either liberal vs. conservative conception (estimates of the amount of the gifted in the population differ), mono - vs. multidimensional (according to the amount of the criteria for the giftedness identification), the definition of potential vs. manifested performance. Our conception of giftedness and it is conceived in the sense of a high ability in the intellect area. The gifted students are those with different cognitive, affective and social characteristics. For example they understand curriculum easily and smartly; use abstract thinking during learning; are self-pacing in solving assignments; have huge knowledge in area of their interest; tend to inductive learning and solving problem; tend to structuring of solving problem and tend to polemic and disagreement; they are active and motivated. Gifted students belong to specific group of students which have also the special educational needs (Heward 2013). For the purpose of respecting these specific educational needs of gifted students, it is usually recommended to modify educational curriculum in its content, process, product, environment and evaluation (Riley, 2011).

In this article we focus on evaluation of gifted students during education. These individuals (as every student) must be evaluated continuously and regularly. This approach helps teachers to orientate themselves in the accuracy of educational goals for gifted students. If the student shows deterioration at school, it´s a sign that something (support of school, family, or individual factors) is wrong in his life. (Callahan 2004)

The gifted student must be evaluated in the context of the sign of his giftedness. The research problem is how to evaluate these criteria into one final outcome. The process of gifted student evaluation must be one of the most important parts of growing up gifted individuals because the outcome is inclusion into the special broad educational program in a form of special school for gifted students or another enriching curriculum. The process of evaluation must be an elaborate system of each school or institution in which they are addressed organizational, conceptual, and ethical and also the methodological issues in which we focus.

Related works and suggestion of solution of problems

During the evaluation process of gifted students a lot of criteria of giftedness are taken into account (Callahan 2004). For example we can evaluate their level of learning quality, logic thinking, creativity in spoken and written expressions, broad vocabulary application, text comprehension, knowledge of school subject, reading, speaking, activity, motivation, etc. These criteria are very different and vague and we need one final outcome.
During evaluation of partial outputs (criteria) the broad model is suggested (Renzulli and Reis 2004). In the broad model the gifted individual must fulfil all or the most of evaluation criteria, so the methodological problem is how to combine these results.

In praxis and theory (Callahan and Renzulli 2012) is application of the additive model registered. In this model the partial outcomes are easily added for each individual in evaluation process. These outputs in a form of some total points are compared. The advantage of additive model is quite easy evaluation, where we add each point together. On the other hand we add the criteria with different conditions and relevance (for example logical thinking and motivation), moreover the results from each different criteria could be inappropriately compensate and give mistaken results of evaluation process.

Hunsaker (Hunsaker 2012) notes, that different evaluation criteria cannot be added linearity. He suggests addition of selected criteria which plays key role for evaluation of gifted students and other less important criteria which are used tentatively. To eliminate these disadvantages we suggest combining each result by using the fuzzy logic. The method allows to clear evaluation of larger number of data without compensation of variables. Its advantage comes from using of vague variables and in used evaluation method.

We found that there were no application of the fuzzy logic during evaluation process of gifted individuals according to analyze of available article database (EBSCO, XERXES and Proquest). There are no articles worldwide concerning evaluation of gifted student via computer aided processing. The buildup model enables evaluation of many students from databases and makes the evaluation objective and unified. The fuzzy logic outperformed evaluation process of gifted people by other methods mentioned in (Callahan and Renzulli 2012; Renzulli and Reis 2004; Hunsaker 2012) from this point of view.

Fuzzy logic

A fuzzy set A is defined as (U, μ_A), where U is the relevant universal set and μ_A: $U \rightarrow$ □0,1□ is a membership function, which assigns each element from U to fuzzy set A. The membership of the element x□U of a fuzzy set A is indicated $\mu_A(x)$. We call $F(U)$ the set of all fuzzy set. Then the "classical" set A is the fuzzy set where: μ_A: $U \rightarrow \{0, 1\}$. Thus x□A □ $\mu_A(x) = 0$ and x □□A □□$\mu_A(x) = 1$. Let U_i, $i = 1, 2, ..., n$, be universals. Then the fuzzy relation R on $U = U_1$ □□U_2 □□... □ U_n is a fuzzy set R on the universal U. The fuzzy logic theory is described in many books such as (Zadeh 1965; Zadeh 2012). The fuzzy application in non-technical field is described in (Dostál 2011; Dostál 2014), but no book in a pedagogical field.

The fuzzy logic system consists of three fundamental steps: fuzzification, fuzzy inference, and defuzzification. See Fig 1.

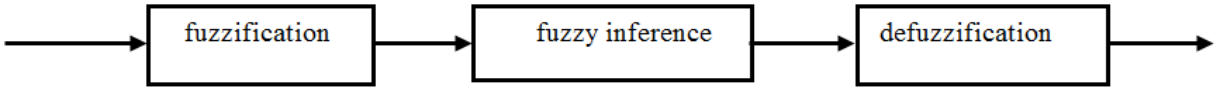

Fig 1. Decision making solved by means of fuzzy logic

Case study

The case study represents process of evaluation of students in the school subject from school classes.

Table 1: Criteria of evaluation (specific)

Criterion:	Input	Weight
1. Learning quality	LQ	(0.0 – 1.0)
2. Logical thinking	LT	(0.0 – 1.0)
3. Creativity in spoken and written expressions	CSWE	(0.0 – 1.0)
4. Broad vocabulary application	BVA	(0.0 – 1.0)
5. Text comprehension	TC	(0.0 – 1.0)
6. Knowledge of school subject	KS	(0.0 – 1.0)
7. Reading	R	(0.0 – 0.3)
8. Speaking	S	(0.0 – 0.3)
9. Activity and motivation	AM	(0.0 – 0.3)

We used the nine criteria (learning quality, logical thinking, creativity in spoken and written expressions, broad vocabulary application, text comprehension, knowledge of school subject, reading, speaking, activity and motivation) which has 5 levels (normalized scale A=1.0-0.8, B=0.8-0.6, C= 0.6-0.4, D=0.4.0-0.2, E=0.2-0.0), where A is extraordinary level and E is inadequate level. The individual weights of variables were set up by the experts on gifted students' evaluation. See Table 1.

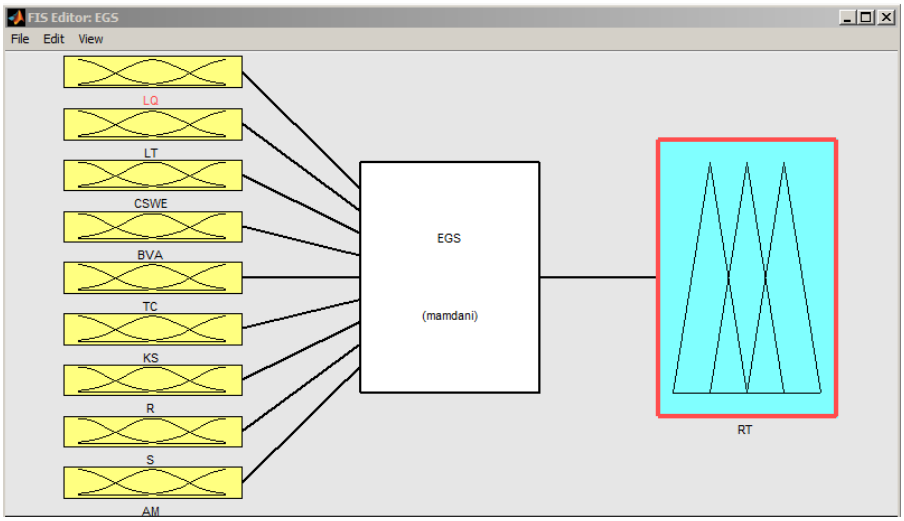

Fig 2. EGS Model

The application of evaluation of gifted students (EGS model) via fuzzy interface system is a result of deep analyses and it has nine inputs Learning quality (LQ); Logical thinking (LT); Creativity in spoken and written expressions (CSW); Broad vocabulary application (BVA); Text comprehension (TC); Knowledge of subject (KS); Reading (R); Speaking (S); Activity and motivation (AM) are used. See Fig 2. The output Rate of Talent (RT) is used.

The fuzzification, defuzzification and fuzzy inference are represented by following steps: The inputs *I=LQ,LT,CSWE,BVA,TC,KS,R,S,AM* have five attributes very low (vl), low (l), medium (m), high (h) and very high (vh) level. See Table 2 and Fig 3.

Table 2: Range for *I*

Fuzzy I	Variable	Range
I_{VL}	Very low (vl)	0.0-0.2
I_L	Low (l)	0.2-0.4
I_M	Medium (m)	0.4-0.6
I_H	High (h)	0.6-0.8
I_{VH}	Very high (vh)	0.8-1.0

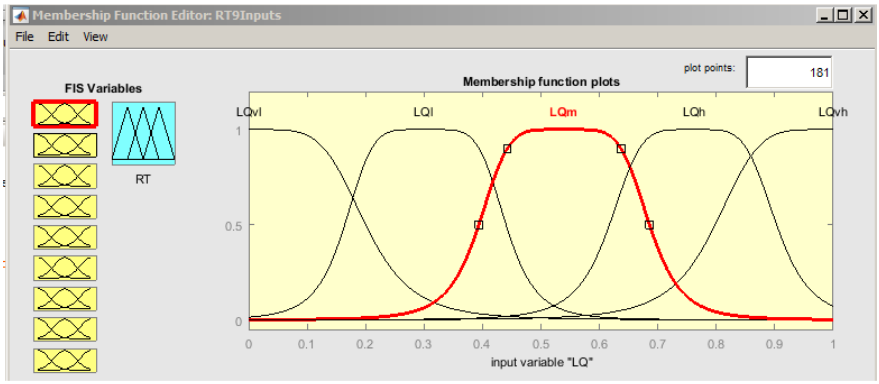

Fig 3. Membership functions for *LQ*

The outputs O=*RT* presents rate of talent it has three attributes low (l), medium (m) and high (h). See Table 3 and Fig 4.

Table 3: Range for *RT*

Fuzzy *RT*	Variable	Range
RT_L	Low (l)	0.00-0.25
RT_M	Medium (m)	0.25-0.70
RT_H	High (h)	0.70-1.00

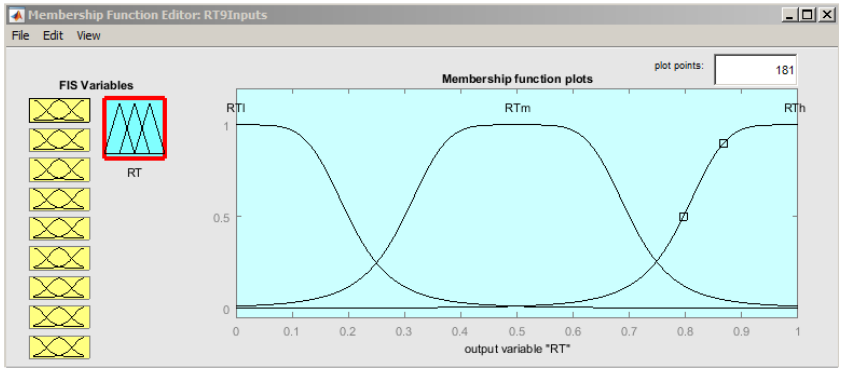

Fig 4. Membership functions for *RT*

The fuzzy inference is represented by set ups of rules such as:
If *LQ*=vl and *LT*=vl and *CSWE*=vl and *BVA*=vl and *TC*=vl and *KS*=vl and *R*=vl and *S*=vl and *AM*=vl then *RT* =vl
If *LQ*= l and *LT*= l *and CSWE*= l and *BVA*= l and TC= l and *KS*= l and *R*= l and *S*= l and *AM*= l then *RT* = l
If *LQ*=m and *LT*=m and *CSWE*=m and *BVA*= m and *TC*=m and *KS*=m and *R*=m and *S*=m and *AM*=m then *RT* =m
If *LQ*= h and *LT*= h and *CSWE*= h and *BVA*= h and *TC*= h and *KS*= h and *R*= h and *S*= h and *AM*= h then *RT* = h
If *LQ*=vh and *LT*=vh and *CSWE*=vh and *BVA*=vh and *TC*=vh and *KS*=vh and *R*=vh and *S*=vh and *AM*=vh then *RT*=vh

And some others. See Fig 5.

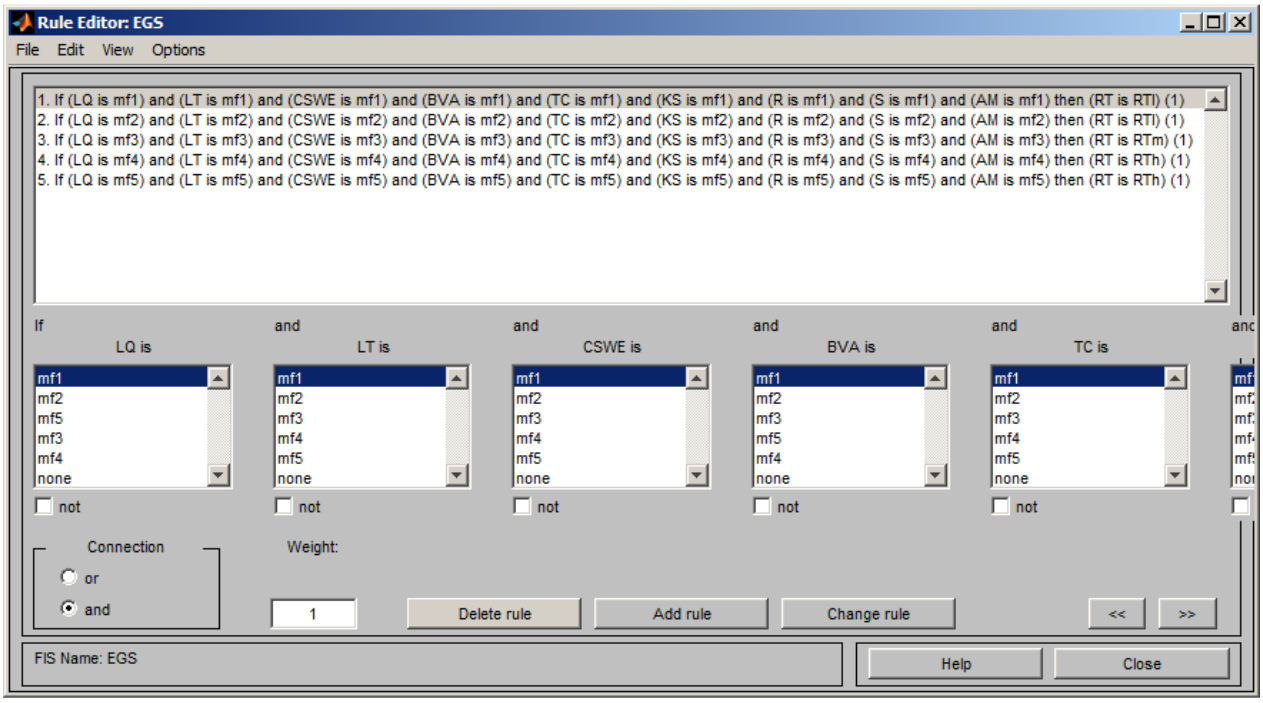

Fig 5. Set up of the rules

The fuzzy model was tuned with the help of MATLAB surface viewer. The rate of talent *RT* is dependent on nine inputs *LQ, LT, CSWE, BVA, TC, KS, R,S, AM*. The dependence of *RT* on *LQ* and *LT* is presented on Fig 6.

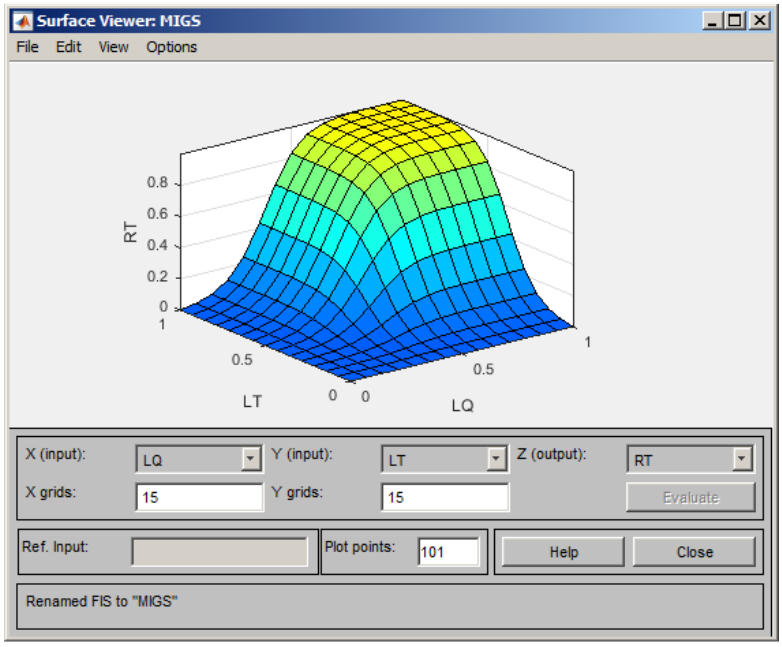

Fig 6. Surface viewer graph

The input values *LQ* = 0.93 (very high), *LT* = 0.92 (very high), *CSWE* = 0.87 (very high), *BVA* = 0.99 (very high), *TC* = 0.88 (very high), *KS* = 0.93 (very high), *R* = 0.94 (very high), *S* = 0.92 (very high),

AM = 0.90 (very high) gives the result *RT* = 0.853, that means that the rate of student is RT=0.853 and it means high gifted student. The inputs and outputs are presented in Fig 7.

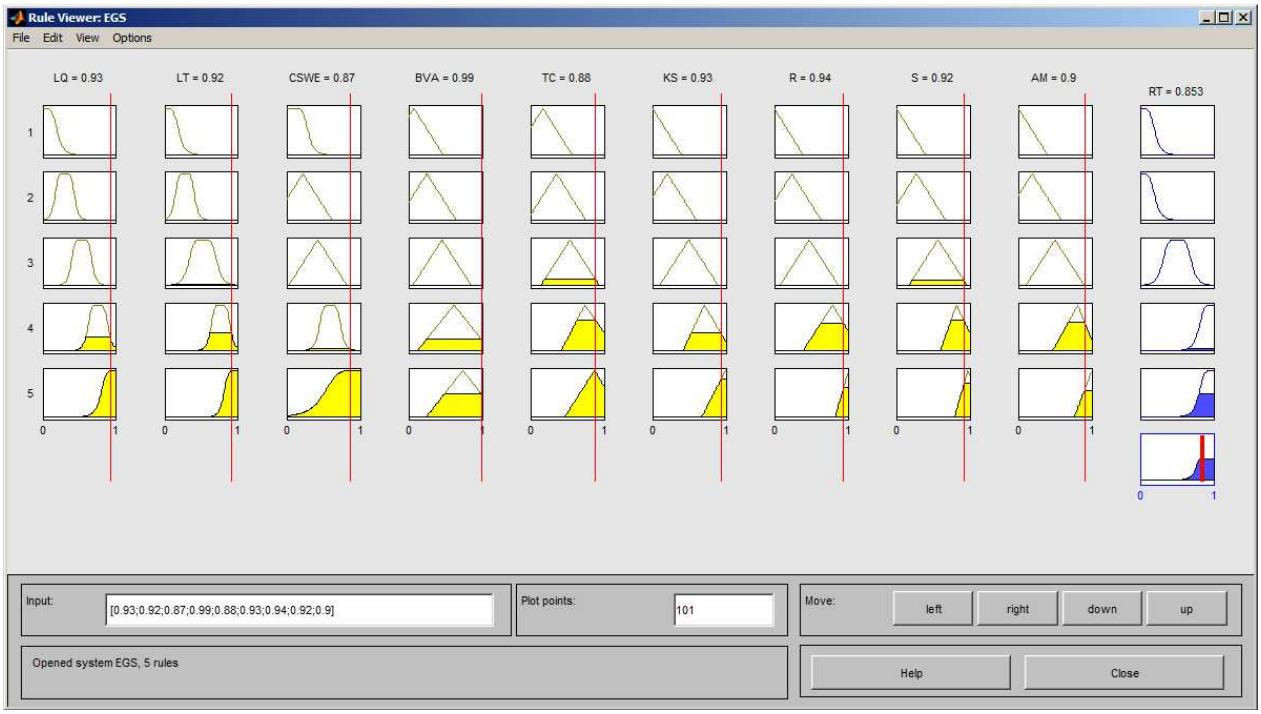

Fig 7. Rules viewer

The students from group with high level of talent demonstrated criteria of giftedness. They have an excellent logical memory; better quality of learning; advanced thought processes; understand abstract concepts better than their peers; see unusual relations and links; show good observation skills; be able to differ even insignificant details; manifest developed vocabulary; have a great knowledge in specific areas of interest.

It was evaluated many students and it results in following proportions: 20% for high, 55% for medium and 25% for low gifted students. The results serves to create the groups of high, medium and low talented student and for their specific education.

Conclusion

In this article we presented the process of evaluation of gifted students in the school subject from ordinary school classes. Students were evaluated with nine criteria: level of learning quality, logic thinking, creativity in spoken and written expressions, broad vocabulary application, text comprehension, knowledge of school subject, reading, speaking, activity and motivation, in which the class teacher evaluated all students in nine criteria, where A was extraordinary level and E inadequate level. We didn´t use "additive model", which is applied in many evaluation process, because of inappropriately compensation of each results of evaluation process.

For evaluating results from nine different criteria we used the fuzzy logic. The method allowed to clear evaluation of larger number of data without compensation of variables. This computing method is very suitable for mentioned purposes and it leads to higher quality of analyses and evaluation of students and educational process themselves.

Abstract

The Seven Principles of Good Practice have been recognized as a benchmarking tool to set educational standards. This paper measured the learning process effectiveness through the seven principles with different factors into consideration such as gender, age, majors, and level of study at New York Institute of Technology (NYIT), Abu Dhabi. The data was collected through questionnaires. We conducted a total of 61 surveys, 14 of which were discarded as some answers were invalid, resulting with a total of 47 valid responses. Five point Likert scale for evaluating the survey responses. The responses were analyzed using SPSS (Statistical Packages for the Social Sciences) software. Data analysis compared the means for every principle and how they differ between the three fields and levels of study (MBA, BSBA and Interior Design. The findings of the paper are anticipated to provide recommendations for the development of pre-implemented principles at NYIT's Abu Dhabi campus in particular.

Keywords: Education, Abu Dhabi, Learning

Introduction

As technology continues to evolve and advance, it is reshaping the process of learning and education among students. This continuous cycle places emphasis on finding methods that will further assure that efficient and beneficial learning methods are implemented. Chickering & Gamson's (1991) Seven Principles of Good Practice embrace the seven crucial principles that, if fulfilled, greatly enhance the students' learning process. The Seven Principles are described briefly as follows:

- **Good Practice Encourages Student – Instructor Contact**

The ability to have regular student and instructor contact during class time or during office hours is a vital facto that will boost student motivation and participation within the learning environment.

- **Good Practice Encourages Cooperation among Students**

The process of learning is enriched when it includes joint group efforts rather than working on your own. Therefore, this group work will lead to excellent outcomes, as well as increase participation and social skills.

- **Good Practice Encourages Active Learning**

Active learning is extremely important since it enables the students to apply it to their own self. In addition, instead of just sitting, listening and memorizing, they could actually relate it to situations and use it within their everyday life.

- **Good Practice Gives Prompt Feedback**

Giving prompt feedback to students enables them to be aware of how they are performing and gives them a chance to work on what they do not know. This will lead the students to take steps to improve.

- **Good Practice Emphasizes Time on Task**

Learning is not complete unless you give it the proper time it needs. The amount of time spent on a specific task is extremely critical for both the students as well as the professors. Therefore, students should be taught how to manage their time.

- **Good Practice Communicates High Expectations**

Having high expectations is a vital factor to encourage the unprepared student, the reluctant student that is not utilizing their skills and the demotivated as well as the motivated student. Thus, leading to complete outcomes.

- **Good Practice Respects Diverse Talents and Ways of Learning**

As we all know, colleges enjoy a vast range of different students, each having their own style and talent. One student varies from one another within the learning environment, since everybody has their weaknesses and strengths. Therefore, it is important to allow students to express their talents in learning and let them choose what works best for them.

This paper aims to identify which of the seven principles are applied and practiced and which ones are not entirely applied in New York Institute of Technology (NYIT). As predicted, the paper seek to further provide and understand the importance of difference in age, majors, and gender as significant factors to assess the effectiveness of learning process.

Literature Review

The Seven Principles of Good Practice have been utilized by many educational bodies as the basis of their research, including measuring how successful their quality of teaching is, and implementing the principles in order to achieve the desired effective learning process (Taylor, 2002) (Graham, Lim, Craner, Cagiltay, & Duffy, 2001). To start with, according to Bruce M. Bradford (1997), The American Association of Higher Education has a set of educational outcomes that were unachievable. However, through implementing the seven principles, it was able to achieve such set outcomes as the seven principles shifted the instructors' focus on incorporating more active learning that in return encouraged student is to perform better. In addition, Ritter & Lemke (2000) used the principles as a basis to evaluate the level of success of active learning as perceived by the students. Using the principles as evaluating tools was a success as they aided the researchers to identify which principles are favoured by students and delivered by instructors and vice versa. Similarly, Singelis (2006) based his research "*Active Learning in Aging Research"* on the seven principles, in which he was measuring the effectiveness of active learning on students' learning and instructors' teaching. Recent research has been conducted in the American University of Cairo (AUC) to assess the effeciveness of massive open online courses (MOOCs) using the Seven Principles of Good Practice (Bali, 2014). The research was conducted by assessing the degree of which each principle (if any) has been practiced by the MOOCs.

The seven principles are also used as as a framework in a study conducted to analyze how the use of podcasting has an impact on the distance student's learning process (Sallan, Simo, & Fernandez, 2009). The results of the study, based on Chickering & Gamson's (1987) Seven Principles, suggested that podcasting is an effective teaching tool that compliments the typical teaching methods, without replacing them.

Statement of Paper

The scope of our paper is limited to the students currently enrolled in the New York Institute of Technology located in the United Arab Emirates. The students are categorized based on their fields of study, age and gender. In our paper, three fields of study are included: Interior Design, BSBA and MBA. This will enable us to analyze if different fields of study embrace or place emphasis on one principle over the other. Similarly, we will be able to detect whether the field of study, age and gender have a significant impact on the student's responds or not.

Our paper results will be based on a survey that will give answers to the following questions:

- Which of the Seven Principles are highly/least favoured by the students?
- What are the students' perception and agreement on use of principles, with respect to their study fields/levels of study, age and gender?
- What are the areas of weaknesses/strength in the program of study? How can they be improved/sustained?

Methodology

Our questionnaire (See Appendix A) is targeted towards learning what students in New York Institute of Technology - Abu Dhabi, think and feel about the learning process they are receiving. Our study covered all three majors in NYIT Business Management, Interior Design and Master's of Business Administration. We conducted a two part questionnaire consisting of a total of 24 questions. The first part is made up of 4 questions targeted towards the respondants profile. The second part consisting of the remaining 20 questions, is targeted towards the students' learning process. The second part of the questionnaire is distributed between the 7 principles as follows:

Principle 1: 4 questions - 7, 10, 11 and 16
Principle 2: 4 questions - 19, 21 and 22
Principle 3: 4 questions - 12, 13, 14 and 15
Principle 4: 2 questions - 6 and 17
Principle 5: 3 questions - 5, 9 and 18
Principle 6: 2 questions - 8 and 20
Principle 7: 2 questions – 23 and 24

In order to get true results and not having to influence them, we sorted the questions randomly and not by principle. This way when our participants answer the questions, they do it truthfully with no influence from our side.

In our general questions, we asked the respondents 4 questions: Gender, Age Group, Major (Field of study) and Year of Enrollment. We placed most emphasis on the field of study in order to see the different learning environments that our college and faculty provide. In the other 20 questions, we gave the respondents 5 options to choose from. We used a 5-point Likert Scale for evaluating our responses: Strongly Disagree, Disagree, Neutral, Agree and Strongly Agree. One of the objectives of this study is to understand the difference in the students' perception of the Seven Principle of Good Practice to test the following hypotheses:

H1. There is a difference in the perception of students based on the gender.
H2. There is no difference in the perception of students based on different age ranges.
H3. There is a difference in the perception of students based on different fields of study.
H4. There is a difference in the perception of students based on different levels of study.

Data Collection and Analysis

Our data was collected in October 2015, a month after the start of university; in order to have the students already accommodated and any new students would have experienced the university and the advising stage. We conducted a total of 61 surveys, 14 of which we had to discard as some answers were invalid, resulting with a total of 47 valid responses. As our emphasis is placed on the field of study, we tried to diversify our selection of audience and resulted with Business Majors to be 55.3% of our total respondants, MBA to be 23.4% of our total respondants and Interior Design majors to be the remaining 21.3% of our total respondants. Responses were analyzed using SPSS (Statistical Packages for the Social Sciences) software. Data Analysis compared the means for every principle and how they differ between the three fields of study that we have, using a confidence interval of 95%.

Findings

Out of the four variables, we tested three variables with each principle. The variables tested are the gender, the age and the field of study. The age variable is tested three times for each principle since we defined three different age groups. Similarly, the field of study variable is tested two times for each principle - Interior Design with BSBA, and MBA with BSBA. In total, the three variables are tested 35 times. By using the 95% confidence interval method we were able to indicate whether the perception of each principle was different based on each variable.

Table 1: Mean Tests in Terms of Gender

	Mean					
Principle(s)	*Male*	*Female*	*t value*	*Sig*	*95% CI*	
Good Practice Encourages Student /Instructor Contact	4.4872	3.9048	4.56	0	0.33	0.84
Good Practice Encourages Cooperation Among Students	4.2115	3.6667	3.139	0.003	0.2	0.89
Good Practice Encourages Active Learning	4.4423	4.1905	1.853	0.07	-0.22	0.53
Good Practice Gives Prompt Feedback	4.3846	3.6667	3.835	0	0.34	1.1
Good Practice Emphasizes Time on Task	4.375	3.9405	2.585	0.013	0.1	0.7
Good Practice Communicates High Expectations	4.1538	3.6825	2.203	0.033	0.04	0.9
Good Practice Respects Diverse Talents and Ways of Learning	4.4231	4.0714	2.077	0.044	0.011	0.69

Based on Gender, all Seven Principles have shown significant differences except for Principle 3.

Figure 1: Mean Values Based on Gender

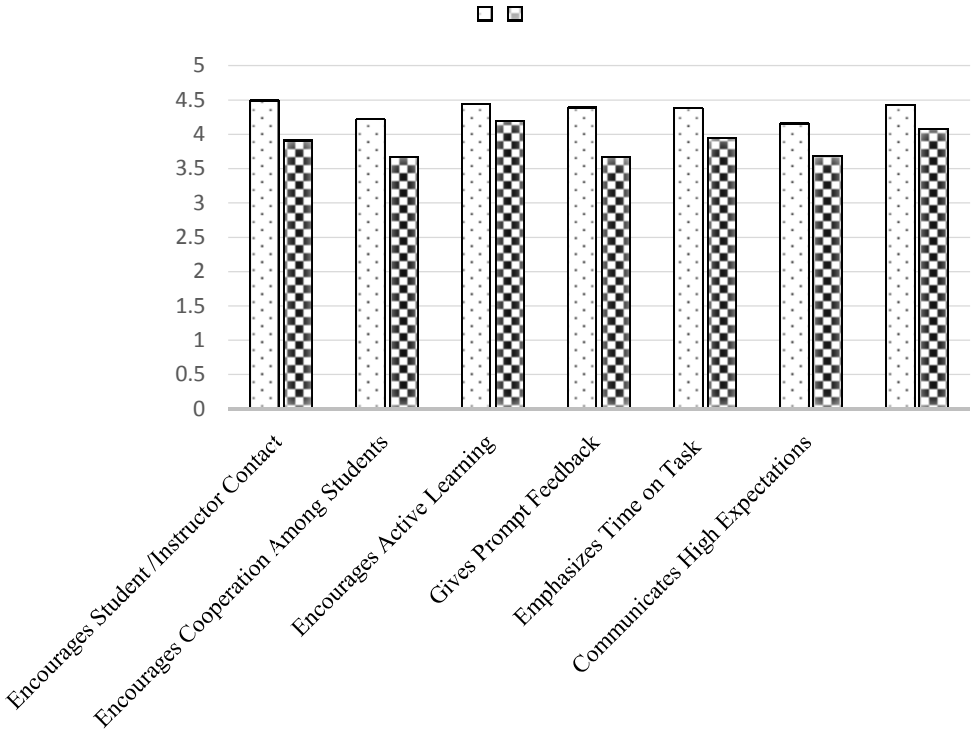

Table 2: Mean Tests in Terms of Age (17-19 & 20-22)

	Mean					
Principle(s)	*17-19*	*20-22*	*t value*	*Sig*	*95% CI*	
Good Practice Encourages Student /Instructor Contact	3.7778	4.303	-2.562	0.018	-0.86	-0.11
Good Practice Encourages Cooperation Among Students	3.4167	4.2273	-3.34	0.003	-0.81	0.12
Good Practice Encourages Active Learning	4.125	4.1818	-0.292	0.773	-0.54	0.14
Good Practice Gives Prompt Feedback	3.4583	4.0455	-1.864	0.076	-1.05	0.06
Good Practice Emphasizes Time on Task	3.8958	4	-0.48	0.636	-0.62	0.21
Good Practice Communicates High Expectations	3.5	3.6667	-0.569	0.575	-0.76	0.34
Good Practice Respects Diverse Talents and Ways of Learning	4	4.1818	-0.7	0.492	-0.61	0.27

Based on Age (17-19 & 20-22), only Principle 1 & has shown significant differences, while all of the remaining Principles have reported no significant mean differences. According to Principle 1, responses range from -0.86 to -0.11, which explains that there are different perceptions surrounding the second principle "Encourages Student/Instructor Contact".

Figure 2: Mean Values Based On Age (17-22)

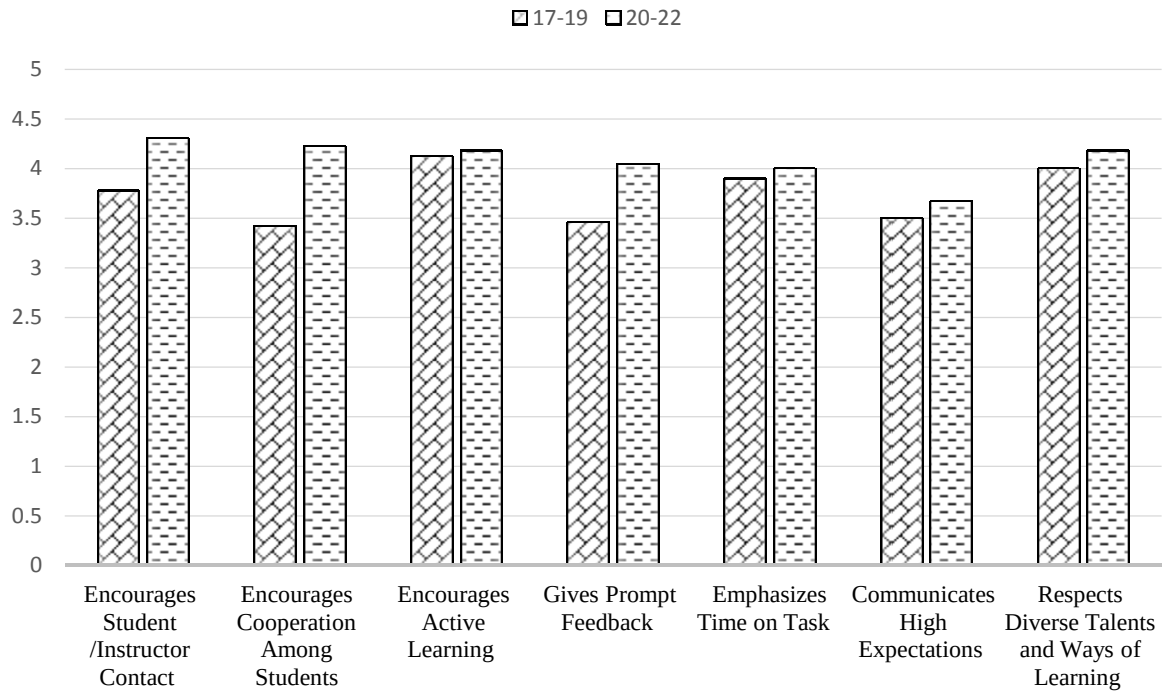

Table 3: Mean Tests in Terms of Age (17-19 & 23-25)

	Mean					
Principle(s)	*17-19*	*23-25*	*t value*	*Sig*	*95% CI*	
Good Practice Encourages Student /Instructor Contact	3.7778	4.303	-2.508	0.02	-0.95	0.099
Good Practice Encourages Cooperation Among Students	3.4167	4.0909	-2.646	0.015	-1.32	-0.31
Good Practice Encourages Active Learning	4.125	4.4545	-1.653	0.113	-0.46	0.35
Good Practice Gives Prompt Feedback	3.4583	4.2727	-2.84	0.01	-1.24	0.068
Good Practice Emphasizes Time on Task	3.8958	4.3864	-2.445	0.023	-0.56	0.35
Good Practice Communicates High Expectations	3.5	4.2424	-2.714	0.013	-0.78	0.44
Good Practice Respects Diverse Talents and Ways of Learning	4	4.3182	-1.308	0.205	-0.72	0.36

Based on Age (17-19 & 23-25), Only Principle 2 has shown significant differences, while all of the remaining Principles have reported no significant mean differences. According to Principle 2, responses range from -1.32 to -0.31, which explains that there are different perceptions surrounding the second principle "Encourage Co-operation among Students".

Figure 3: Mean Values in Terms of Age (17-19 & 23-25)

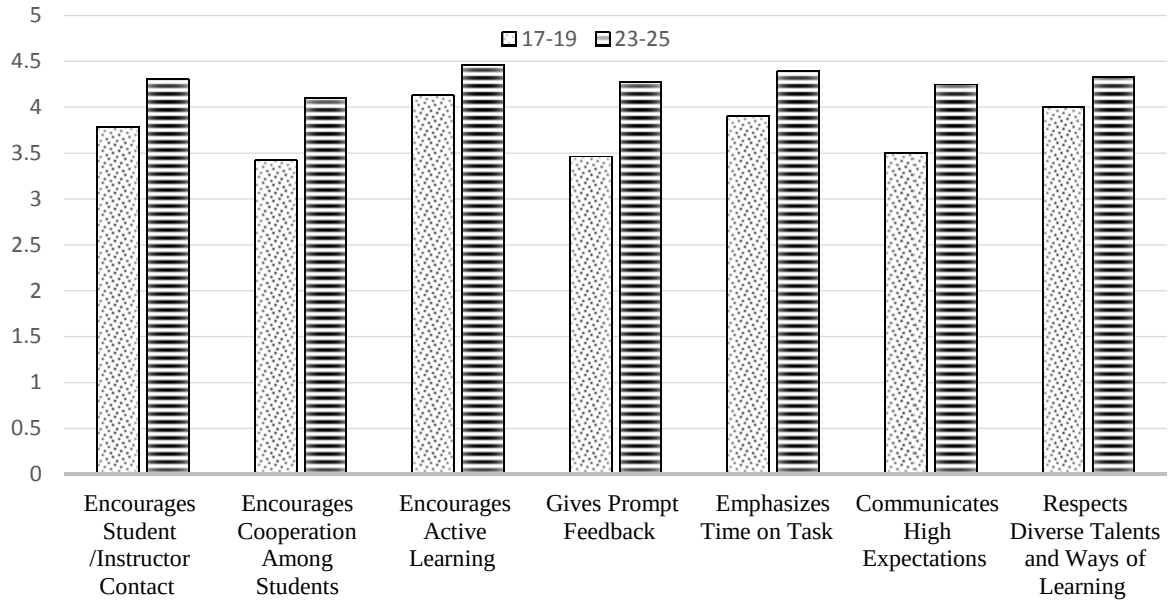

Table 4: Mean Tests in Terms of Age (17-19 & Above 25)

	Mean					
Principle(s)	*17-19*	*Above 25*	*t value*	*Sig*	*95% CI*	
Good Practice Encourages Student /Instructor Contact	3.7778	4.5128	-3.987	0.001	-0.17	0.58
Good Practice Encourages Cooperation Among Students	3.4167	4.1538	-3.101	0.005	-0.027	0.87
Good Practice Encourages Active Learning	4.125	4.5385	-2.293	0.031	-0.021	0.65
Good Practice Gives Prompt Feedback	3.4583	4.4615	-3.808	0.001	-0.21	0.84
Good Practice Emphasizes Time on Task	3.8958	4.4231	-2.272	0.033	0.066	0.95
Good Practice Communicates High Expectations	3.5	4.3333	-3.01	0.006	0.1	1.11
Good Practice Respects Diverse Talents and Ways of Learning	4	4.5385	-2.821	0.01	-0.33	0.61

In this case, based on Age (17-19 & Above 25), Only Principle 5 & Principle 6 have shown significant differences, while all of the remaining Principles have reported no significant mean differences. According to Principle 5, responses range from 0.066 to 0.95, which explains that there are different perceptions surrounding the fifth principle "Emphasizes Task on Time". According to Principle 6, responses range from 0.1 to 1.11, which explains that there are different perceptions surrounding the sixth principle "Communicates High Expectations".

Figure 4: Mean Values Based On Age (17-19 & 25 Above)

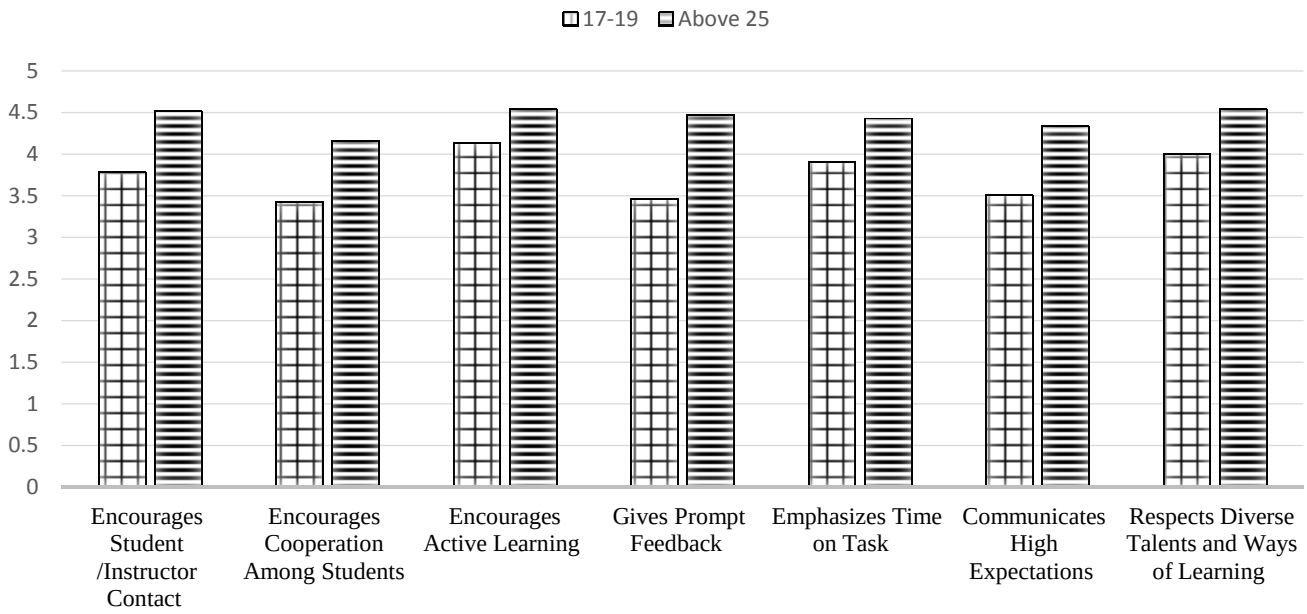

Table 5: Mean Tests in Terms of Major (IND & BSBA)

Conclusion

Applying the Seven Principles of Good Practice is crucial for any academic institution. It helps to examine not only the performance of student's learning, but also the institution itself. The main aim of this paper is to examine which of the seven principles are favored by the students at Abu Dhabi

campus of New York Institute of Technology and how they perceive them based on their age, gender and major.

The findings of the mean tests of the seven principles showed a significant difference between the age groups, gender and majors.

Even though NYIT Abu Dhabi covers these principles in each of their course's syllabus and carries out evaluations for the curriculum taught, it would be beneficial to make the students aware of the great importance these principles carry for their learning period not only for the current level of study, but for higher education as well.

As the findings show, one of the principles least rated is the encouragement of cooperation amongst students. NYIT can engage students from different majors to participate in in-group activities. Inter-major group activities would not only help the students to learn educational and personal enriching traits from each other, but also expand their skill set of working in a group and networking that is crucial to grow their career horizon.

In addition, further research can be done to make these principles comparable to different factors including universities, nationalities and study fields in Abu Dhabi.

Abstract

Using a dataset comprising 50 corporations listed at NASDAQ and component of Dow Jones index, over an extended period spanning 2000-2013, this article explores the link between corporate governance and taxation. The analysis is primarily carried out by estimating panel least squares and quantile regressions, combined with robustness checks such as generalized least squares, generalized linear model, and generalized method of moments. Our results show that the share of non-executive directors on the board, as well as board size negatively influences the effective corporate tax rate. Furthermore, we document a mixed association between CEO ownership, along with CEO tenure, and corporate taxation.

Keywords: effective corporate tax rate; corporate governance characteristics; panel data regression models; quantile regression.

1. Introduction

A special subject of finance is the corporate finance being not only comprehensive in terms of information presented, but also of interest to a broad range of stakeholders in the financial markets: shareholders, managers, investors. In the academic literature about corporate finance, numerous studies are devoted to the development of forecasting techniques for markets evolution, but there are also authors that make reference to corporate governance, an area for which has been granted a growing interest after the crisis of 2007. Besides specific phenomena from the world of finance, the human nature is an important element that leaves its mark (seemingly invisible, but significant) on financial markets. And the better we can support this referring to the notorious studies made by Kahneman and Tversky (1979, 1986). In this paper we tried to apply a procedure seen in watercolor paintings where was desired to obtain a gradient between two colors, so we applied the 'brush' of the empirical research on both corporate governance and the effective corporate tax rate. The novelty brought consists of an interdisciplinary study, dual, which includes a representation of fiscal management and the board characteristics, focusing on the idea of human nature as an influence factor, and we have highlighted the interdependencies between the two areas, all in the context of corporate finance. Although the literature about these two combined topics is rare, the ultimate goal of this paper

seeks to identify whether corporate governance influences the effective corporate tax rate, starting from the premise that earlier studies showed that separate, the two influence the financial performance (see Lee and Swenson, 2012; MacAvoy and Millstein, 1999).

The effective tax rate can be used in financial analysis with duties that transcend the sphere of fiscal management, from researching the lack of protection for minority shareholders to the means of tax avoidance, legal or not, used for the process of tax optimization. Perhaps even more important than corporate governance, the effective tax rate is a useful tool dedicated to the stakeholders 'trinity' and to the analysis of human relationships within it, translated into financial decisions targeting the company. Another goal is to identify correlations or connections between effective tax rate and corporate governance both in terms of objective point of view and subjective one (human nature) that can be considered as references for future papers on this issue. It is interesting to see if and how the management decisions (CEO, Board of Directors) on reducing the effective rate are influenced by rules imposed by corporate governance, and whether they may affect the company as a whole. Erkens et al. (2012) obtained results showing that corporate governance has affected financial performance during the crisis in 2007, meaning that companies with a large number of independent members have urged the shareholders to bring more capital and took fewer risky decisions, but that would had been favorable for company.

The paper proceeds as follows. Section 2 presents the prior literature. The data and empirical setting are provided in Section 3. Empirical results follow in Section 4. The paper concludes in Section 5 with a summary of the findings.

2. Prior research

Few authors researched the link between corporate governance and effective corporate tax rate. For the convenience of the reader, we named the effective corporate tax rate with the acronym ECTR. At first glance, the effective tax rate leads to the idea of taxes imposed by the state. However, the ECTR is very important in the context of fiscal management and tax optimization, being a good reflection of managerial decisions for the entire company. The literature on the ECTR is abundant and prolific but stands out the works carried out by Devereux and Griffith (1999) being a landmark for this area. Important contributions were made by Gupta and Newberry (1997), Richardson and Lanis (2007), along with Nicodème et al. (2014) who studied the relationship between ECTR and financial performance for US companies. They have demonstrated empirically that company size, indebtedness, leverage, ROA, ROE, and other financial items are factors which significantly influence the effective tax rate. Because these results are highly debated in the literature, we gave them a greater attention in the empirical research section. In terms of corporate governance, notable studies on the link between financial performance and characteristics of the Board of Directors (independence, size) and the CEO were brought by Yermack (1996), Metrick and Ishii (2002), Bhagat and Bolton (2008).

Studies that explicitly include both elements of corporate governance and ECTR are very few, but some authors have attempted an analysis between the governance and tax avoidance methods, making an indirect link

between the two. Sometimes confused with tax aggressiveness, Watson (2011) defined the legal tax avoidance as all means and strategies taken by the company, through the manager and the Board of Directors to reduce the tax burden, in other words, to reduce the effective corporate tax rate. Bauman and Schadewald (2001) showed that shareholders have appreciated the managers who had the ability to reduce the ECTR and have paid them according to the level of tax burden reduction. Armstrong et al. (2015) considered that unless paying more attention to agent problems that occur within a company, managers will apply more methods of tax avoidance to reduce the ECTR and to show a positive image to shareholders, but sometimes these methods may have negative effects on company's performance.

Although the tax planning is significant from a financial point of view, a manager should not permit the 'tax' tail wag the financial 'dog'. Hanlon and Heitzman (2010), as well as Gallemore et al. (2012) consider companies that use a small level of tax avoidance to reduce ECTR, as marked by dilemma 'under-sheltering puzzle'. As there is no clear evidence to support that tax avoidance involves direct costs, Gallemore et al. (2012) do not understand why some companies do not use this method. On the other hand, a CEO knows that all financial decisions have tax consequences and he should not be afraid to take a decision only from this perspective. Desai and Dharmapala (2006) argues that by reducing tax avoidance, as part of the tax planning, shareholders can control and reduce managerial deviations resulting from the agent's problem. The purpose of tax planning is to identify all the solutions that streamline the company's financial situation by reducing tax obligations. Desai and Dharmapala (2006) suppose that if by reducing the ECTR, using the methods of tax avoidance, the transparency of the company is affected, then there is an increase in the opportunities for CEOs to use the company's financial resources in its own interest, and appears the phenomenon named by literature 'managerial rent extraction'. Also, Desai and Dharmapala (2006) state that this is not possible in companies showing good corporate governance and obtained empirical results that support a negative relation between the CEO's remuneration in the form of equity ('manager's equity incentives') and tax avoidance/reduction of ECTR. Armstrong et al. (2015) challenged this idea and considered this type of CEO's remuneration as part of corporate governance mechanism, rewarding being determined by the Board of Directors in order to ease the agent problems. Thus, compensation in the form of equity should be functional in companies with lower corporate governance (small number of independent members, others). Further, Vintilă and Păunescu (2015) provide empirical evidence for large NASDAQ listed companies, components of Dow Jones, showing that compensation as bonuses has a positive relationship with ECTR. Rego and Wilson (2012) acquired empirical evidence that the ECTR reduction through tax avoidance is correlated with high levels of CEO compensation.

Dyreng et al. (2010) presented evidence that CEO predisposition towards reducing the effective tax rate by using aggressive tax avoidance is preserved even if they are employed at the same position in another firm. Thus, the ECTR becomes an important milestone when companies and boards of directors, interested in tax planning, analyze managerial skills of a candidate for CEO position. Blaylock (2011) analyzed US companies but failed to support the hypothesis that the problem of agent which says that managers are getting their own benefits from the use of tax

avoidance in order to reduce the ECTR. Florackis (2008) argues that if the CEO hold shares in the company, will be less tempted to seek own benefit to the detriment of the company.

Studying the relationship between effective tax rate and corporate governance, Armstrong et al. (2015) proposed the quantile regression (QR) estimation method instead the consecrated OLS econometric method that is conditioned mean type. The QR estimation follows the relationship between corporate governance and the entire distribution of ECTR because the level of tax avoidance influences the latter. Tax avoidance was seen as a riskier opportunity available to the management. Hence, a bigger Board of Directors and more efficient will realize the benefits of cash flows by reducing the effective tax rate and will want to increase tax avoidance because it does not bear a risk in terms of investment. Awareness of board members is relevant, for they must know when is exceeded the legal and moral limit to reduce the ECTR, because too much use of tax avoidance may have costs that exceed the tax savings achieved through reduced taxation. Armstrong et al. (2015) have included the independence and the financial expertise of the members of the Board in analyzing the relationship ECTR/corporate governance, and noted that there is a positive link between independence, financial expertise, and tax avoidance on the left side of the tax avoidance distribution and a negative relation to the right side. Thus it was shown that a company with several independent members and with developed financial expertise may reduce problems of agent arising with tax avoidance (over/under utilized) used by the CEO to reduce the ECTR in an ineffective governance conditions. Robinson et al. (2012) have studied the role of financial development of the company and have shown a positive link between the degree of financial expertise of the audit committee and tax avoidance applied to reduce the ECTR, but found that when companies consider that tax avoidance is risky the link becomes negative.

Minnick and Noga (2010) demonstrated empirically that a Board of Directors that do not show a balance between members (executive and independent) will lead to an increase in the effective tax rate. Florackis (2008) believes that shareholders holding large blocks of shares will benefit from the advantage of reducing the ECTR and will require the manager to fulfill this task but they want to monitor of this process. Chen et al. (2010) consider that shareholders will be the most affected by the penalties and reputational costs that exist for the use of tax avoidance, the proof of their existence being that not all companies have low levels of ECTR. Ribeiro et al. (2015) analyzed the determinants of effective tax rate and included elements of corporate governance. They obtained evidence supporting that insider's holdings of shares known as 'insider ownership', are associated with lower levels of ECTR. Another element identified was the concentration of ownership that for low levels was correlated with a higher ECTR. Ribeiro et al. (2015) obtained results showing that companies with a large number of members inside boards of directors had a higher ECTR. The same positive significant relationship was found between the number of independent members and the ECTR.

Florackis (2008) considers that often managers are not interested in reducing the ECTR, which is positive for shareholders' patrimony, because it does not directly fulfills their interests. Therefore, to be incentivized to reduce ECTR and to work out their duties of increasing the shareholders' wealth, managers should be rewarded in company's shares. Through this mechanism of corporate governance, the interests of both parties in the ECTR

reduction become the same and thus, it reduces the information asymmetry and agent issues. Badertscher et al. (2013) believed that through ownership of shares, the manager would not want to reduce too much the ECTR by any means, because it increases the risk of being affected in both positions they hold in the company. Subscribed to this idea were Fraile and Fradejas (2014) which supported the idea that once the manager will hold shares, he will have a greater power to act in his own interest.

Another element of corporate governance to be analyzed in conjunction with the effective tax rate is the structure of the Board and its characteristics. Studying the empirical relationship between the number of members from the board of directors, and financial performance (ROA, ROE, ROIC, Tobin Q), Vintilă et al. (2015) obtained mixed results. Wahab and Holland (2012) consider that these results are due to the experience brought by a large number of members, but also by hindering the adoption of financial decisions of each member. Florackis (2008) considers that a greater number of non-executive members have an important role in monitoring information asymmetry related to financial decisions. In addition, Vintilă et al. (2015) obtained results that support this idea.

3. Research design

3.1. Sample data

This study examines 50 companies, mainly from the technology area, listed at NASDAQ and component of Dow Jones index, from 2000 to 2013. The sample of issuers is drawn from Thomson Reuters Eikon database. Variable definitions are presented in Table 1. We use the effective corporate tax rate as outcome variable, together with characteristics of board (independence and size) and CEO (ownership and tenure) as explanatory variables.

Table 1. Definitions of variables used in empirical analysis

Variables	Description
Variables towards taxation (Dependent variable)	
ECTR	Effective corporate tax rate, calculated as Income Tax (Total) / Net income Before Taxes (EBIT).
Variables towards corporate governance characteristics (Independent variables)	
Board characteristics	
BIndep	Board independence, which depicts the share of non-executive directors on the board.
BSize	Board size, which relates to the total number of directors on the board, computed as ln(The total number of executive directors + Non-executive directors).
CEO characteristics	
CEO_Hold	CEO ownership, which denotes the percentage of company stock held by CEO.
CEO_Tenure	CEO tenure, which shows the length of time that a CEO has been at the helm of the corporation.
Firm-level control variables	
FSize	Firm size, as proxied by total assets (logarithmic values).
ROA	Return on assets ratio, found by dividing net income to total assets, assessing the efficiently of the firm towards using its assets.
Debt/Equity	Debt-to-equity ratio, which reveals a measure of a firm's financial leverage, respectively how much of a company is financed by its debtholders compared with its owners.
Debt/Assets	Debt-to-total assets ratio (also known as Debt ratio), showing the percentage of debt used to finance assets.

Source: Author's own work.

With respect to firm-level variables, we control for firm size, performance, and indebtedness. The political cost theory advocates a positive relation between firm size and tax since larger firms register higher degrees of

political costs such as public scrutiny. Instead, the political power theory specifies a negative connection for the reason that larger companies show more political power that can be disposed to handle their tax burden or lobby lawmaking in their benefit. Stickney and McGee (1982) and Porcano (1986) find a significantly negative link between effective corporate tax rate and firm size, whereas Zimmerman (1983) and Omer et al. (1993) revealed a significantly positive relation. Nevertheless, other studies provide evidence for a lack of association (Jacob, 1996; Gupta and Newberry, 1997; Mills et al., 1998).

Concerning financial performance, Noor et al. (2010) finds that firms with higher return on assets face lower effective corporate tax rates, whereas Gupta and Newberry (1997) ascertain that ETRs are systematically related to return on assets.

As regards indebtedness, Lasfer (1995) uncovers a weak association between leverage and effective tax rates, concluding that companies decide on capital structure to lessen agency costs rather than to benefit from tax deduction. Further, Gupta and Newberry (1997) and Rego and Wilson (2012) establish that firms with high leverage ratios are related with lower effective tax rates harmonious with higher tax avoidance, whereas Wilson (2009) and Lisowsky (2010) proved that tax shelter firms are linked with lower leverage ratios.

3.2. Econometric specification

The data set has the structure of a panel data. Each data point in the panel data indicates the ith firm (i = 1, . . . , 50) at the tth period (t = 2000, . . . , 2013). The basic equation model used to explore the link between corporate governance characteristics and effective corporate tax rate is depicted below:

$$ECTR_{it} = \alpha + \beta X_{it} + \varepsilon_{it} \quad (1)$$

where $ECTR_{it}$ is ECTR for company i in year t, X_{it} is a set of corporate governance characteristics and firm-level controls, ε_{it} is the error term. Primary, we will estimate several panel least squares regressions (both without cross-sectional effects and with cross-section fixed effects). However, 'since traditional OLS and median regression only estimates the relationship at the "center" of the distribution, these techniques cannot detect shifts elsewhere in the distribution of interest' (Armstrong et al., 2015). Consequently, we will employ later on quantile regression technique because 'is more general and describes changes in both the location and shape of the distribution of interest' (Armstrong et al., 2015). Withal, the robustness of the empirical results will be checked by means of various techniques such as estimated generalized least squares (EGLS), generalized linear model (GLM), and generalized method of moments (GMM).

Furthermore, the Granger (1969) approach is employed in order to examine how much of the current corporate governance characteristics can be explained by past values of them and then to see whether adding lagged values of ECTR can improve the explanation. Corporate governance characteristics are said to be Granger-caused by ECTR if ECTR helps in the prediction of corporate governance characteristics or if the coefficients on the lagged corporate governance characteristics are statistically significant.

4. Empirical results

4.1. Summary statistics

The descriptive statistics of the variables are presented in Table 2. The mean (median) ECTR for our sample is 28.015% (29.30%). As regards board independence, we acknowledge the lack of balance between executive and nonexecutive directors.

Table 2. Descriptive statistics

	N	Mean	Std. Dev.	Min.	Lower Quartile	Median	Upper Quartile	Max.
ECTR	700	0.28015	0.109489	0.000000	0.22720	0.29300	0.34900	0.82500
BIndep	700	0.12992	0.216752	0.000000	0.00000	0.00000	0.32258	0.66667
BSize	700	2.84301	0.377792	1.945910	2.48491	2.89037	3.13549	3.66356
CEO_Hold	700	0.07099	0.294398	0.000000	0.00000	0.00000	0.02000	6.67000
CEO_Tenure	700	2.28571	4.634087	0.000000	0.00000	0.00000	2.00000	26.00000
FSize	700	14.99689	4.125629	4.175925	12.80437	16.68184	18.20295	20.49733
ROA	700	0.09940	0.068681	0.000868	0.05400	0.08777	0.13528	0.65420
Debt/Equity	700	0.73884	1.043053	0.000000	0.05500	0.34500	0.91500	6.62308
Debt/Assets	700	0.45160	0.238057	0.000000	0.27316	0.45928	0.60044	1.21000

Source: Author's computations. For variable description, see Table 1.

The selected firms are profitable since the reported mean (median) ROA is 9.940% (8.777%). However, the companies from our sample are highly levered with a mean (median) Debt/Equity ratio of 73.884% (34.50%).

Table 3 contains the correlations between the variables. With the exception of the strong uphill (positive) linear relationship between BSize and FSize (0.719553), all of them show low correlation coefficients, so that multicollinearity should not be a concern.

4.2. Regression results

Table 4 provides the estimates of panel least squares regressions (without cross-sectional effects). We test the influence of board and CEO characteristics on ECTR, both separately and all once. Therefore, board independence (Eq 1, Eq5, and Eq 7) and board size (Eq 2, Eq 5, and Eq 7) negatively influence ECTR, but the explanatory power of the estimated models is reduced (a mean value of 4.32% related to R-sq). On the contrary, the relationships between CEO ownership and ECTR (Eq 3, Eq6, and Eq 7), as well as CEO tenure and ECTR (Eq 4, Eq6, and Eq 7) are not statistically significant.

Table 4. Panel least squares regressions of ECTR on corporate governance characteristics and firm-level controls

Further, the estimates with fixed effects are showed in Table 5. The negative influence of board independence on ECTR is reinforced (Eq 1, Eq5, and Eq 7), but the relationship between board size and ECTR get out of sight. Nevertheless, we find a negative influence of CEO tenure on ECTR (Eq 4 and Eq 6). This fact is related to the experience of the CEO about tax system, accumulated over the years.

By extending the empirical research by means of quantile regressions (see

Table 6), the results confirm the negative influence of Bindep on ECTR (all the estimated equations). Likewise, Bsize relveals a negative influence on ECTR (Eq 4 - Eq 8), but for quantiles over 0.3. Onward, we establish mixed associations between CEO_Hold and ECTR: positive (for quantiles between 0.3 and 0.5) and negative (at the 0.9 quantile or the 90th percentile). CEO_Tenure positively influences ECTR for upper quantiles (0.8 and 0.9). All these results can be attributed to the fact that executive and independent members from the boards and CEO, all of them have different views, opinions and interests regarding the level of ECTR, as we mentioned in Section 2.

By employing robustness checks via panel EGLS, GLM, and panel GMM (see Table 7), the negative influence of board independence (all the estimated models) and board size (Eq 2) is strengthened. However, the lack of influence related to CEO_Hold is emphasized. In addition, the influence of CEO_Tenure is mixed: positive (Eq 1) and negative (Eq 3 and Eq 4). Contrary Gupta and Newberry (1997) results, ROA had a negative sign for GMM estimation method. This fact shows that managers can use the financial performance to reduce ECTR, as a political power and in the interest of the company and shareholders.

Table 8 reports the output of Granger causality examination. We find, only for the first lag, that board independence Granger cause ECTR, even if the reverse causality is not valid. This fact is associated with the reluctance of the independent members about tax avoidance.

Table 8. Pairwise Granger Causality Tests

Null Hypothesis	Lag 1		Lag 2		Lag 3	
	Obs	F-Statistic (Prob.)	Obs	F-Statistic (Prob.)	Obs	F-Statistic (Prob.)

Source: Author's computations. For variable description, see Table 1.

In addition, for the first lag, ECTR Granger cause CEO tenure. Economically, this can be explained by the fact that only the experienced CEOs can juggle it with the tax system breaches and regulation, so that, taxation's harshness has an influence when a company employs a CEO, according his tenure. For the rest of variables and lags, the causality relationships are not statistically significant.

5. Concluding remarks

This paper examines the link between corporate governance characteristics and effective corporate tax rate. We extend the empirical research by estimating panel least squares regressions and quantile regressions. From the perspective of board characteristics, the results provide support for a negative influence of board independence on effective corporate tax rate opposite Ribeiro et al. (2015), but similar Armstrong et al. (2015) for high levels of tax avoidance. Also, we ascertain a negative influence of board size on effective corporate tax rate contrary Ribeiro et al. (2015), due to issues related to communication and coordination. As regards CEO characteristics, we find mixed results between CEO ownership and corporate taxation by means of quantile regression. Also, CEO tenure documents opposed results, namely negative influence when estimating panel least squares regressions (cross-section fixed) and positive for upper quantiles regressions. The robustness checks confirm the negative influence of board characteristics on effective corporate tax rate and support the mixed influence of CEO tenure. Likewise, the Granger (1969) approach emphasize that board independence Granger cause corporate taxation. All these findings can be explained by the influence of informational asymmetry and agency problems, but the true puppeteer behind the scene is the human nature who acts in the benefit of its owner: managers, directors, board members and shareholders.

The Attitude to Islamic Taxation in Russia: Does Financial Ethics Matter?

Nadezhda A. Lvova, PhD, Associate Professor, St. Petersburg State University, 7/9 Universitetskaya nab., St. Petersburg, 199034 Russia, E-mail: n.lvova@spbu.ru; lvova_n.a@mail.ru

Abstract

In this paper, the authors have raised and tested a set of questions concerning the essence of the Islamic taxation model in relation to taxpayers' financial ethics. The main question of the research addresses key factors, which determine the advisability of introducing a special socially oriented tax with signs of zakat in the opinion of persons with low-level awareness of the Islamic tax system (the case of Russia). To challenge this question, it was considered appropriate to conduct a survey. Relevant factors were revealed by means of ordinal logit modeling. It was proved that the corresponding loyalty positively relates to the following statements: a) an individual should regularly donate a part of his income to support the socially vulnerable categories of the population; b) administrating socially oriented taxes should be the responsibility of special non-governmental organizations with publicly available and transparent reporting; c) any socially oriented expenditures should be taken into account in the personal income tax. The chances to support the abovementioned special tax are significantly higher for younger students. In summary, there is a clear interconnection between financial ethics and opportunities to implement the Islamic tax model. It should be noted that Islamic taxation, focused on personal and social responsibility of taxpayers, creates for them maximum convenience and ensures their involvement and commitment. In our opinion, these aspects need to be taken into account in the traditional tax administration. Therefore, we believe that in the question of an effective taxation, financial ethics really matters.

Keywords: Islamic taxation, Islamic taxes, Islamic finance, Islamic financial system.

1 Introduction

Islamic ('alternative' or 'participation') financial markets and institutions present in most countries of the world. Islamic finance is a rapidly growing industry. Between 2009 and 2013, Islamic financial assets raised by 17% annually and reached $1.87 trillion at H12014 (Islamic Financial Services Industry Stability Report, 2015). Leading positions are occupied by Islamic banks, accumulating more than 90% of the assets (Islamic Finance, 2013). In this situation, it is quite natural that the literature on Islamic finance primarily addresses controversial issues on alternative banking (Lvova, 2013). The focus of research regards special features and development prospects of the Islamic banking model (Khan, 2010; Beck et al, 2013; Azmat et al, 2015). Maybe, even more attention is attracted to comparative advantages of alternative banking in the light of modern financial challenges (Čihák, Heiko, 2010; Hasan, Dridi, 2011; Khediri et al, 2015; Gheeraert, Weill, 2015). Sharia compliant financial markets, instruments and non-banking institutions are also widely discussed in much the same way (Hussain et al, 2015; Kammer et al, 2015; Lukonga, 2015; Rizvi et al, 2015; Farooq, 2015).

However, comprehensive research on Islamic public finance has been relatively few and rare (Bekkin, 2013). This gap reasoned the direction of our investigation. The article raises one of the most important aspects of this problematic – Islamic taxation, which is commonly observed from legal (e.g., Saleem, 1992; Al-Qardawi, 2000; Powell, 2009), organizational (Awad, 2000; Yusuf, Derus, 2013) and social (Abdullah et al, 2015; Mohd et al, 2015) perspectives. The key question of our research is greatly applies to financial ethics and can be formulated in the following way: what major factors determine the advisability of introducing a special socially oriented tax in the opinion

of persons who are not well informed about Islamic taxation? In this regard, we are going to cover three main issues:

1. The role of Islamic taxation in the Islamic financial system and the essence of Islamic taxes.
2. The perceptions of financial ethics in the modern Russian society.
3. The dependence of loyalty to a special socially oriented tax on financial ethics.

The methodology of our research, which is based on survey results, corresponds with a rather representative corpus of works on Islamic finance. However, as in the general case, these works are primarily concerns Islamic banking[1]. A remarkable exception is a Malaysian research proved that religiosity has a minimal positive impact on voluntary tax compliance (Mohdali, Pope, 2014), What is more notable and rightly pointed by the abovementioned authors, “the grounds for non-compliance or compliance behaviors of taxpayers are still inconclusive” (Mohdali, Pope, 2014), that predetermines the relevance of further research.

2 Islamic taxation in the context of the Islamic financial system

2.1 The Islamic financial system: the essence and structure

The history of Islamic finance is dated back the 7th century (Haron, Azmi, 2012). It is thought that the Islamic financial practices were well known in the medieval Europe. However, the Islamic financial system was established not earlier than the late 20th century: the first modern Islamic financial institution started working in 1963; the first commercial Islamic bank was opened in 1975; at the end of 1970s, Islamic financial institutions appeared in the Europe; the first retail Islamic bank in Europe has been operating since 2004 (Ivanov, 2014).

According to functional approach, the Islamic financial system can be defined as the set of markets and institutions used for financial contracting and the exchange of assets and risks in accordance with sharia principles. However, in our research, we strive to go beyond the Islamic financial industry taking into account public financial sector. Guided by this reason, we attribute Islamic taxation to the Islamic financial system. In this case, we need a broader interpretation of the latest, which allows focusing on the nature and subjects of financial relations.

Correspondingly, we consider the Islamic financial system as a regulated system of distributional relations connected with the formation and use of financial resources by public institutions, private organizations and households to accomplish their goals and objectives in accordance with sharia.

The ethical component is one of the most important characteristics of the Islamic financial system. Sharia financial principles are inseparably linked with religious requirements. Consequently, these principles significantly differ from traditional ones. In particular, Islamic financial relations should contribute to social justice.

The most important Islamic financial principles are the following:

– First of all, there is a ban on interest rate. In this context, interest rate is treated as a source of ill-gotten income because a lender does nothing to earn it[2]. Nevertheless, the "Islamic economics ... has nothing against the so-called natural rate of interest, or net productivity of capital … directly dependent on the profitability of investments" (Bekkin, 2007a).

– The prohibition of speculative behavior and uncertainty in contract terms. Consequently, if one party receives excessive advantage by another party, terms of the contract must be revised or corresponding transaction cannot take place. In this regard, the concept of profit and loss sharing is worth noting. The main point about it is that parties involved in a financial transaction must share both associated risks and financial results.

– The prohibition of some directions of investment activity (financing harmful activity). This principle refers to the activities that may cause physical or mental harm to individuals or society as a whole (production of weapons, alcohol, gambling, etc.).

The main sense of these principles is to discourage unfair incomes and ensure equality of opportunities. Therefore, each financial transaction should be tied with tangible underlying assets or business revenues. Surprisingly, money is considered an intangible asset.

Besides, all Muslims must pay a special socially oriented tax.

Let us turn to the institutional dimension of the Islamic financial system. From traditional perspective (Bodie, Merton, 2004), it consists of four elements (Gordeeva, Lvova, 2009):

– Financial markets (markets for Islamic financial instruments).
– Financial institutions (Islamic banks, Islamic investment funds, Islamic insurance companies, etc.).
– Financial instruments (Islamic debt- and equity-based financial instruments).
– Organization of operations and supporting infrastructure (in particular, corresponding legislation, professional standards, lawmakers and regulators).

In the strict sense, the matter concerns the Islamic financial services industry (IFSI) as it is commonly addressed (Islamic Development Bank 35th Annual Report, 2010). However, to characterize the Islamic financial system, we should not lose sight of no less important element – Islamic public finance, including taxation.

There is one more important gap. The term 'Islamic financial system' is usually applied in the international context. The same time, national financial system can be more or less 'Islamic'. In some countries, such as Iran and Sudan Islamic banks are the only mainstream financial institutions. In others, they exist alongside conventional financing. The Middle East and Asia dispose substantial rates of Islamic financial assets (Islamic Finance, 2013; Imam, Kpodar, 2010). Evidently, the most of the related literature is devoted to the cases of these regions (as a typical example: Khediri et al, 2015).

Commitment to Sharia in the country scale, as it would be logical to assume, largely depends on the size of the Muslim population. However, the Russian Federation with her multimillion Muslim population (The World Factbook) is highly conventional in the financial sphere. There has been almost no Islamic financial market here (Zhuravlev, 2014). All the essential elements of the Islamic financial system have been just emerging. Nonetheless, Islamic taxation is one of the most developed institutions.

2.2 Islamic Taxation

Islamic taxation is one of the most important institutions of the Islamic financial system. Principles of Islamic taxation correspond to the basic principles of financial relations complying with Muslim ethics[3].The list of Islamic taxes is fiercely debated for compliance with the Quran and (or) Sunnah (Bekkin, 2007b) and, what is the most interesting for financiers, the nature of the tax (for zakat see, e.g., Shaikh, 2009). Mobilization and redistribution of the raised funds within Islamic taxation are less fiscal than religious. Islamic taxes combine traditional imposing and innovative levying. The center of the Islamic tax system is zakat. Zakat represents a group of 'fard' (compulsory) payments relating to imposition of various objects and taxpayers with different non-taxable minimum (the 'nisab' for zakat) at differential rates. Such payments are characterized by common principles of levying and redistribution (L'vova, Pokrovskaya, 2015).

The special features of zakat are the following:

– Mandatory payment of zakat is reasoned by the religious duty of Muslims as one of the 'Five Pillars' of their faith. Therefore, zakat is a sphere of personal responsibility that logically eliminates the need for external enforcement to pay the tax;
– Targeting spending of zakat is stipulated in the Quran: "Zakat expenditures are only for the poor and for the needy and for those employed to collect [zakah] and for bringing hearts together [for Islam] and for freeing captives [or slaves] and for those in debt and for the cause of Allah and for the [stranded] traveler – an obligation [imposed] by Allah" (the Quran, Surah At-Tawba Verse 60);
– The religious duty to pay zakat means that Islamic taxes can be successfully collected without governmental institutions providing rule of law and ensuring compulsory levying of secular taxes;
– Regardless of whether zakat is paid by the support of governmental or non-governmental institutions, its size and terms of payment are defined in the Koran and Sunnan, as well as in the commentaries. Zakat cannot be considered as a donation. It is a purifying tax of a certain size.

Notably, zakat-payers are exclusively Muslims. Consequently, the regional structure of the Islamic tax system does not always correspond to the administrative-territorial structure of modern countries. Moreover, Muslims are subjected to double taxation, since they have to pay zakat along with traditional taxes at the place of their tax jurisdiction.

Zakat is the integral part of the state tax system in Yemen, Libya, Malaysia, Pakistan, Saudi Arabia and Sudan. Another nine Muslim countries (Bahrain, Bangladesh, Egypt, Indonesia, Jordan, Iran, Kuwait, Lebanon and the United Arab Emirates) provide varying degrees of governmental support for the institution of zakat, including tax privileges for its payers (mitigation of double taxation amongst others), co-operation in funds redistribution and (or) financial control over donation. In other Muslim countries, zakat administration is carried out without the participation of the state. This is especially the case for the countries where Islam is not the predominant religion. Unsurprisingly, zakat is not officially stipulated in the Russian Federation. However, it is voluntarily paid by Muslims to non-governmental organizations.

3 Methodology

For our research we conducted the survey of second-, third- and forth-year bachelor students on faculty of economics of Saint Petersburg State University. The survey was completed by 127 persons (both male and female) (Fig. 1).

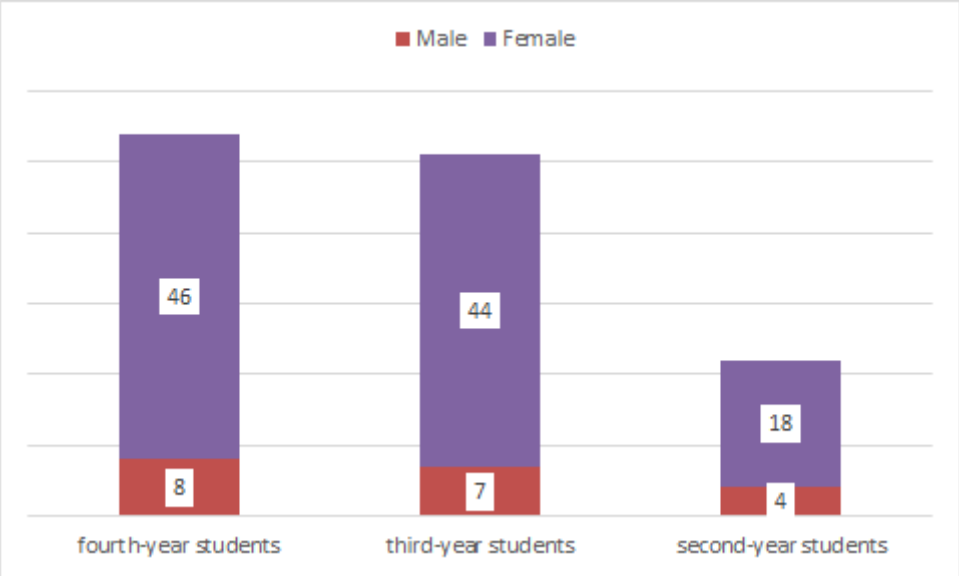

Fig 1. The respondents of the survey on Islamic taxation

The questionnaire included 20 questions, which constituted two groups. The first 10 questions were devoted to the degree of awareness of religious taxes and the Islamic financial system. The second 10 questions reflected the attitude of respondents to the ethical foundations of financial relations and the social responsibility.

Each question suggested ranking the answer from negative ('positively wrong', 'probably not true') to positive ('more true', 'positively true'). Fifth variant was 'unable to choose an answer'.
Our first hypothesis was a low level awareness of the Islamic tax system:

– H_0: respondents have enough knowledge about Islamic taxation.
– H_1: respondents have little knowledge about Islamic taxation.

Second part of our research was econometric modeling of the factors, which determine the loyalty to imposition of a special socially oriented tax with signs of zakat.

– H_0: the loyalty to imposition of a special socially oriented tax with signs of zakat does not on the set of subjective (the attitude to financial ethic and social responsibility) and objective (gender and the year of education) factors.
– H_1: the loyalty to imposition of a special socially oriented tax with signs of zakat depends on the set of the abovementioned factors.

In other words, we test the hypothesis that all of the coefficients in the model are equal to zero (alternative hypothesis that at least one of the 12 regression coefficients in the model is not equal to zero) and then choose significant factors As loyalty to imposition of a special socially oriented tax ordinal variable, we applied the ordered choice method, ordinal logit modeling in Stata 11.

4 Results

4.1 Testing the Awareness of the Islamic Finance and Taxation

Our first hypothesis was a low level awareness of the Islamic tax system. In our survey, we used questions reflected as subjective as objective awareness concerning Islamic finance in general, religious taxes and Islamic taxes. Only 10% of respondents state that they are aware of Islamic finance. At the same time more than one third students believe that main principle of the Islamic finance is prohibition of usury, 14% believe that Islamic finance system operates both in Muslim and non-Muslim countries (Fig. 2).

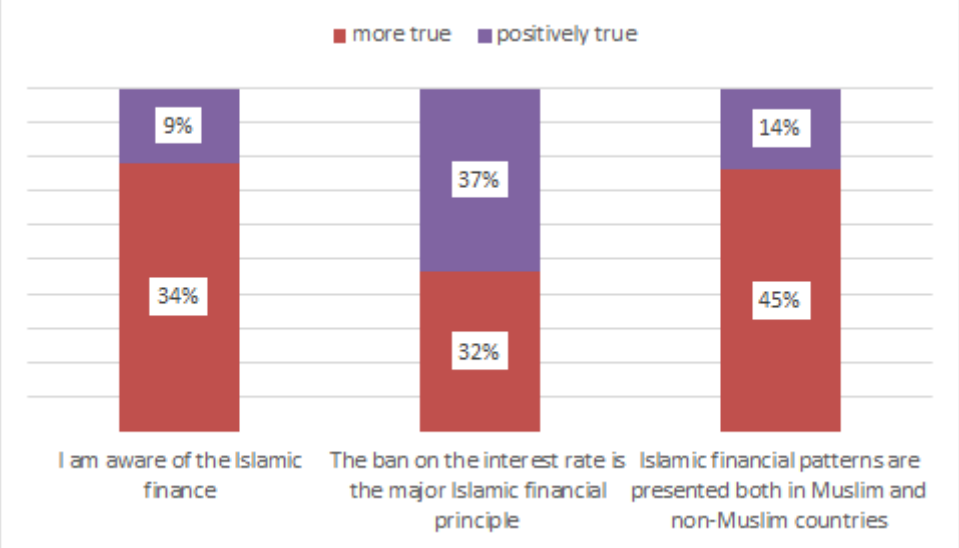

Fig 2. The awareness of the Islamic financial system

Therefore, we suppose, that subjective low level of awareness about Islamic financial system supported by objective awareness, could mean opinion of respondents, that their knowledge about Islamic finance is insufficient; they want to know more.

Awareness of religious taxes is lower. More than a half of respondent state that they are not aware of religious taxes (Fig. 3).

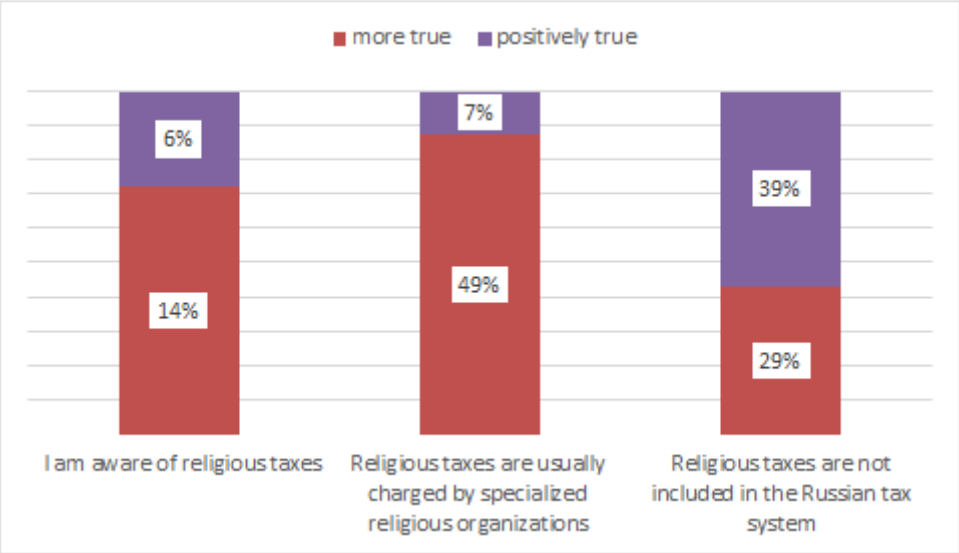

Fig. 3. The awareness of religious taxes

The lowest was awareness of sharia taxes. Only 5% of respondents believe that they are aware of sharia taxes. Surprisingly, all of them answer that there are not sharia taxes in Russia, which make their subjective awareness doubtful (Fig. 4).

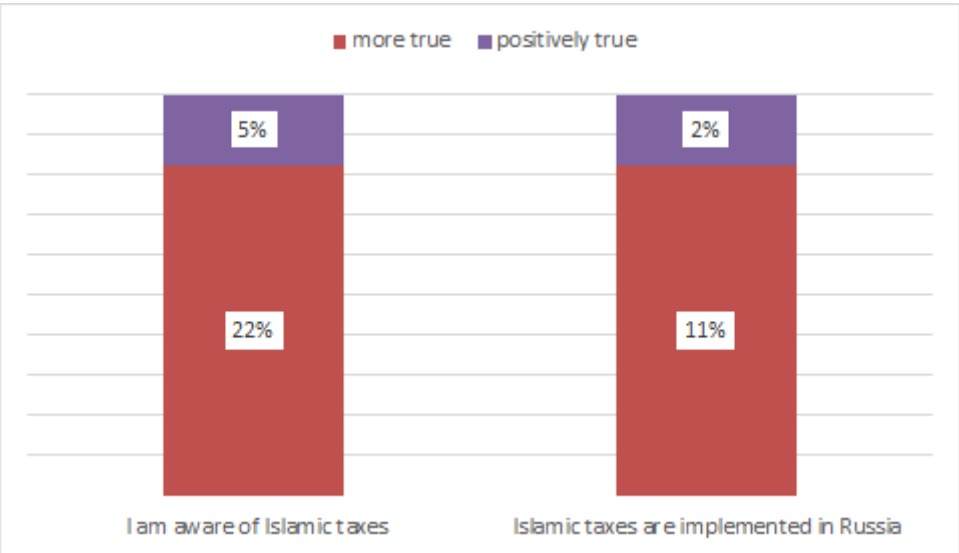

Fig. 4. The awareness of sharia taxes

Taking into account the survey results in aggregate, the authors come to conclusion that hypothesis about low level of awareness about sharia finance and taxation was confirmed.

4.2 Modeling the Loyalty to Imposition of a Special Socially Oriented Tax

Second part of the research implies econometric modeling the loyalty to imposition of a special socially oriented tax with signs of zakat.

In the analysis, 122 from 127 observation were used excluding those with incomplete answers.
12 regression coefficients were tested:

– 9 ordinal variables based on second part of questionnaire and reflected the attitude of respondents to the ethical foundations of financial relations and the social responsibility;
– 3 sets of dummy variables: for female students, for second-year students, for third-year students.

In the issue, we obtained the following statistically significant model (tab. 1).

Table 1: modeling the loyalty to impose a special socially oriented tax with signs of zakat

/cut2	4.453875	1.12938			2.240332	6.667418
/cut3	7.111679	1.259993			4.642138	9.58122

The selection of relevant factors was based on t-test at 5% significance level. Table 1 shows that only five factors proved to be significant, including:

– opinion that financial relations should comply with strict moral principles;
– a financial system should promote socially equal distribution of income in the society;
– a state should provide financial support for socially vulnerable categories of the population;
– all of the society is responsible for such kind of financial support;
– an individual should carry the donations to support the socially vulnerable categories of the population at a certain time and amount.

Chances to agree with imposition of the special socially oriented tax are significantly higher for the second-year students, compared to third- and forth-years students. Such a result, in our view, means that younger students associate themselves with taxpayers to a lesser extent. The same time, gender differences were found to be insignificant.

The factor which reduces the likelihood of agreement with the imposition of a special tax with signs of zakat is the perception that financial support for socially vulnerable categories of the population is a compulsory element of social responsibility as applied to the business community

5 Conclusions and Discussion

We consider the Islamic taxation as one of the most important elements of the Islamic financial system, which can be defined as the set of financial markets and financial institutions operating in accordance with some special principles. These principles, focusing on the social and religious aspects of financial relations, strongly differ from the conventional ones. Therefore, there are two dimensions of our research: not only financial, but also ethical.

The role of Islamic taxation in the Islamic financial system is usually underestimated. The same time, this institution is widely represented and develops at the rapid pace. In many countries, including Russia, Islamic taxes are collected and distributed by non-governmental organizations. What is also important to note, Muslims are largely guided by religious norms in their everyday life. Therefore, the rate of Muslim population is the significant factors for the Islamic financial system's growth. Therefore, the importance of Islamic financial instruments and taxes in Russia and other countries will surely increase.

The research proved that there is a clear interconnection between taxpayers' financial ethics and opportunities to implement the Islamic tax model. In particular, the loyalty to imposition of the special socially oriented tax with signs of zakat positively relates to the following statements: an individual should regularly donate the part of his income to support the socially vulnerable categories of the population; administrating socially oriented taxes should be the responsibility of special non-governmental organizations with publicly available and transparent reporting; any socially oriented expenditures should be taken into account in the personal income tax.

As for the further research, subsequent surveys seem prospective to be conducted attracting other respondents: a) with higher level of awareness about Islamic financial system; b) from regions with high rate of Muslim population; c) older than second-, third- and forth-year bachelor students.

In conclusion, we would like to stress that Islamic taxation, focused on personal and social responsibility of the taxpayer, presumes innovative tools. Methods of effective tax communication and special marketing techniques are used. Transferring zakat is possible with a wide range of modern payment instruments. This, in sum, creates maximum convenience for taxpayers and ensures their involvement and commitment. In our view, such positive aspects need to be taken into account in the traditional tax administration. It means that financial ethics does really matter in the question of an effective taxation.

Notes

[1] Let us put an example. The research on development prospects of Islamic banking in India showed that the respondents (the students of three universities in Chennai) "have a positive and favorable patronage towards Islamic Banking due to their perception about its success in other parts of the world" (Masvood, Lokeswara Choudary, 2015). To study the required factors, the authors of the abovementioned research applied percentage analysis, t- test and ANOVA. As for the Russian Federation, there have been few surveys of attitude to Islamic financial principles, institutions and instruments, but in contrast to international practice without economic modeling (e.g., Kalimullina, 2010).

[2] As it is well known, usury was prohibited in the Medieval Europe. Let us illustrate this assertion by a quotation from 'The Divine Comedy' (Dante):
"…*Obsequious follows, as the learner treads*
In his instructor's step, so that your art
Deserves the name of second in descent
From God. These two, if thou recall to mind
Creation's holy book, from the beginning
Were the right source of life and excellence
To human kind. But in another path

The usurer walks; and Nature in herself
And in her follower thus he sets at nought,
Placing elsewhere his hope…".

However, there is a clear difference between the Islamic and the early European conceptions of interest rate (for more details: Homer, Sylla, 2005).

[3] In this regard, let us draw attention to such feature of the Islamic tax system, as the absence of indirect taxes. These taxes cause higher prices for goods. They are not directly related to welfare of consumers. The same time, being paid by rich and by poor, indirect taxes are regressive by nature and, consequently, have the greatest burden on needy. It is very remarkable that in the days of the Prophet Muhammad, fixing taxable wealth and income was rather complex matter. Therefore, duties and excises were the most widely spread. However, direct taxes of all taxes and duties become Islamic, since they admit implementing socially fair redistribution of income. To the present day, tax systems of many Muslim countries, including those of the Cooperation Council for the Arab States of the Gulf, are based on direct taxes. Religious leaders do not support projects on VAT implementation because this tax contradicts the spirit of Islamic taxation. Hence, there are great concerns of substantial VAT evasion in the case of its imposition (Gurnak et al, 2014).

Abstract

Innovation has become a 'magic word' in management practice and economic policy. An innovative company is defined as a company that develops innovative services, products and internal processes and is not a trend follower but a trend setter and can thus profit from a competitive advantage. Therefore, innovation is received as the actual path to growth because the assumption is that innovation is the success driver for the firm and increases its value disproportionally. However, innovation initially results in only costs and risks. Thus, the question occurs regarding how to measure the performance contribution of innovation in scientific studies to provide evidence whether innovation really pays back, particularly in the context of the concept of second mover advantage, which questions the idea of first mover advantage and favors imitation instead of innovation. Therefore, the first part of this conceptual paper criticizes recent studies and develops an own approach, which will be tested in the paper's second part. To prepare this test, the first part develops a predictor based on a case study.

Keywords: Innovation, Innovativeness, Meassuring Innovativeness, Research & Development, Key Performance Indicators, Firm Performance

JEL Classification: C18 Methodological Issues: General; D22 Firm Behavior: Empirical Analysis; O32 Management of Technological Innovation and R&D

Introduction

Due to increasing dynamics and complexity, as well as highly saturated markets, a rethinking of business is required to stand out from the competition, which usually leads to price competition between companies with increasingly more comparable products and services. The common believe is that innovation is the key to escaping from ruinous price wars.

In stagnant or saturated markets, growth can result from three sources: customer loyalty, marketing, and innovation whereas the latter factor can also be seen as synonymous with quality. An innovative company is distinguished in that it develops services, products and internal processes at least as fast as the market changes. It is not a trend follower but a trend builder and can thus be one of the first to take an advantage, with the result of higher profitability due to a competitive advantage. The implementation of promising ideas into successful innovations is not only time-consuming but also a

costly and risky challenge. Innovation requires often high financial investments while the chances of success cannot be determined.

The problem is that the simple connection between innovation and firm performance is not as simple as it seems on the first view. The objective of this study is to develop a testing approach to determine in more detail the performance contribution of innovation beyond the R&D expenditure as the main determining variable. Two measurement dimensions derive from this study's issue: (1) firm performance and (2) innovation. In the case of firm performance, possibly the best reference is the so-called success factor research.

The main financial indicator in quantitative empirical studies concerning innovation and its impact on firm performance is R&D expenditures. This approach is criticized as insufficient. This becomes particularly apparent in relation to firm performance. Thus, for example, Sridhar observes in their study on innovation that R&D expenditures and revenue are correlated moderately high. The interpretation of this result is not as simple as it may be on the first view, because the existence of a correlation neither reveals anything about causality nor the direction of a possible direct causal link between both variables. They can co-vary only randomly or are influenced by a third variable, etc. This problem becomes apparent also by a simple case study of three companies (Apple, Fiat and Honda).

If one compares the correlations between the R&D costs and performance metrics of Fiat and Honda, it appears that the correlations between R&D expenditures and revenues and R&D expenditures and intangible assets is as high as in the case of Apple. More relevant concerning the testing of the NI/R&D ratio is the fact that Apple's net income explains only 30% of the ROIC variance, whereas the NI/R&D ratio 85% of the ROIC variance, whereas the range between Fiat's NI/R&D ratio (explained variance = 88%) and its net income (explained variance = 86%) is very small. To remind once again, both ROIC and the NI/R&D include net income as a factor, so that generally a higher correlation is expected. More important is the fact that net income doesn´t explain Apple's ROIC, but the NI/R&D ratio does. Therefore, the assumption is that the NI/R&D ratio expresses the value contribution of innovation in the case of Apple. This is all the more obvious in the face of the explanation power of Apple's R&D and intangible assets as independent variables (see Tab.4) and their correlations with the ROIC.
These results show that in both cases, the NI/R&D ratio is comparably high, which can be explained by the fact that the ROIC and the NI/R&D ratio is calculated based on net income whereas the range between the NI/R&D-ROIC correlation and the net income/ROIC correlation in both cases is extremely different. This leads to the assumption that the range between both correlations may be the value to differentiate between innovative and non-innovative companies. Based on this concept, the second part of this conceptual paper will test the difference between the NI/R&D-ROIC correlation and the NI/ROIC correlation as a predicator with a larger sample from one industry. The hypothesis is that this profitability–innovation predicator allows the prediction of firm performance due to the firm-specific innovativeness.

I. Research Problem

Due to increasing dynamics and complexity, as well as highly saturated markets, a rethinking of business is required to stand out from the competition, which usually leads to price competition between companies with increasingly more comparable products and services. The common believe is that innovation is the key to escaping from ruinous price wars.

An innovative company is distinguished in that it develops services, products and internal processes at least as fast as the market changes. It´s not a trend follower but a trend builder and can thus be one of the first to take an advantage, with the result of higher profitability due to a competitive advantage[1]. In stagnant or saturated markets, growth can result from three sources: customer loyalty, marketing, and innovation[2] whereas the latter factor can also be seen as synonymous with quality. According to management text books, innovation is the main driver of firm growth and company performance because growth always takes place where the invention of new markets is possible.

Therefore, innovation is widely regarded as the success driver for businesses because innovation increases firm value mostly disproportionally[2]. Thus, the creation of innovation, from selling new products to the introduction of new procedures in operations, is seen as the key success factor for companies and organizations in academic research[3].

On the other hand, innovation causes, first of all, only costs because market success does not come by itself. Budgets suffice often only for research and development, but not for the production, product launch, and market penetration, so that innovation failure is often caused by a lack of ample funding[4]. The implementation of promising ideas into successful innovations is not only time-consuming but also a costly and risky challenge. Innovation requires often high financial investments while the chances of success cannot be determined.

Real innovation includes transformed ideas and developments into new products, services or processes. Thus, commercial implementation as the diffusion of innovation in the market is an indispensable part of innovation, at least in the framework of economic research and theory.

According to Hausschildt[5] innovation is characterized as follows:
1. New Combination of Means and Ends: Innovations cover market needs. Innovation is a combination of problem-solving with a market need.
2. Commercializability/Marketability: An innovation is successful if the market launch is successful and the innovation reaches the break-even point. The product must prove itself in the market as economically successful.

In particular, the second characteristic is of a high relevance for this conceptual paper. To pronounce it, innovation must be profitable; otherwise, it is a nice but a costly idea.

In economics, the term innovation was introduced by Schumpeter's theory of innovation, who defines innovation as the implementation of a new production function[6]. Recent literature distinguishes a variety of innovation categories such as (1) product, process, business model and management innovation, (2) technical and organizational innovation, (3) service innovation, (4) business model innovation, (5) design innovation, and (6) social innovation[7]. For Schumpeter an innovator is the creative entrepreneur as opposed to arbitrage entrepreneur who exploits only existing price differences, respectively, market inefficiencies for profit. The creative–destructive entrepreneur searches for new fields of economic activities[8]. His driving force is the short-term innovation monopoly, which provides the innovative entrepreneur a ‘pioneer premium’, which results in monetary benefits, for example, by means of higher productivity through process innovation or through higher pricing due to product innovation and a temporary monopoly[9].

According to Schumpeter, innovation is the implementation of technical or organizational innovation in the production process, not just the invention itself[10]. Thus, innovation is a process and not only a one-time event, in terms of idea generation and must be distinguished from creativity and invention. In contrast to creativity, which is engaged in the development of ideas, innovation is the commercial exploitation of ideas in the form of the transformation of ideas and inventions in monetary successful products or services[11]. Therefore, innovation management is seen as a key part of corporate strategy and refers to, on the one hand, products and services, but also on the other hand, to production processes, organizational structures, and management processes. Thus, innovation has an exterior side referring to the market, and an interior side referring to the firm, because product innovation usually aims at better meeting the customers’ needs whereas process innovation focuses on improving the effectiveness and efficiency of processes within the firm[12].

The problem is that the simple connection between innovation and firm performance is not as simple as it seems on the first view. Empirical research regarding innovation and firm performance must deal with the problem that detailed internal data at the firm level are hardly available, so that research often must rely on external data[13] available from, for example, annual reports, board presentations, or market research studies.

II. Research Problem

The application of R&D expenditures as general measure for innovation intensity is widely criticized in the literature as not being sufficient to measure innovativeness[15]. The identified problem is that the multi-dimensionality of innovativeness is hardly to measure. This becomes explicitly apparent regarding the many dimensions and types of innovation mentioned in the sections above. Therefore, the challenge is to make more use of the rare available data in using more advanced instruments developed in the context of financial analysis, which is mainly developed to evaluate a single company or a stock but is also relevant for analyzing larger datasets. This may be a way to improve the quality of empirical research in the field of innovation and firm performance, which is the objective of this two-part conceptual paper.

The approach of this conceptual paper is to test a research approach with a limited data set of 30 companies from one industry based on a further developed variable set, which allows going beyond the testing of only first-order and second-order financial variables from annual reports. Thus, the objective of this study is to develop a testing approach to determine in more detail the performance contribution of innovation beyond the R&D expenditure as the main determining variable.

Two measurement dimensions derive from this study's issue: (1) firm performance and (2) innovation. In the case of firm performance, possibly the best reference is the so-called success factor research. In this research field, performance is measured mainly in terms of firm growth based on a variable set for which financial research provides metrics to measure quantitative and qualitative growth. Davidson and Delmar (1997) and Delmar et al. (2003) found that turnover/sales is the most frequently applied performance measure in the field of success factors research.

It must be noted critically that employee growth may be an indicator for the expansion of the firm, but not in the sense of business success, because the expansion of employees is at first the expansion of costs. Thus, employee growth seems to be a not so suitable indicator for performance, whereas revenue indicates at least that the company expands on the market to a certain extent, and is thus an indicator for market success. Only a few studies use profitability ratios such as return on equity (ROE), return on assets (ROA), or return on invested capital (ROIC) whereas none applies market share or economic value-added metrics as firm performance indicators.

The main financial indicator in quantitative empirical studies concerning innovation and its impact on firm performance is R&D expenditures (e.g., Abazi-Alili, 2014; Sridhar et al., 2014). As mentioned, this approach is criticized as insufficient[16]. This becomes particularly apparent in relation to firm performance. Thus, Sridhar et al. (2014), for example, observe in their study on innovation that R&D expenditures and revenue are correlated moderately high with[17] $r = 0.691$ and $p < 0.05$. The interpretation of this result is not as simple as it may be on the first view, because the existence of a correlation neither reveals anything about causality nor the direction of a possible direct causal link between both variables. They can co-vary only randomly or are influenced by a third variable, etc. This problem becomes apparent also by a simple case study of three companies, which will be conducted in the following sections.

Apple may be seen as ideal–typical for an innovation-driven, company[18]. If one calculates Pearson's R to determine the correlation between R&D costs and revenue, intangible assets, gross profit as well as net income, Apple shows no correlation with $r < 0.9$ (fig. nr. 1).

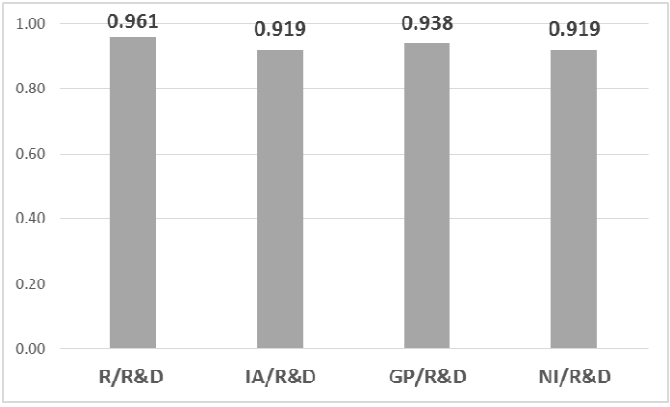

Fig. 1. Correlations between R&D Costs and Performance Indicators for Apple (2005–2014)
Data Source: Revenue, intangible assets, gross profit, and net income from Morningstar Database.

Note: R = revenue, IA = intangible assets, GP = gross profit, NI = net income.
Source: Own calculation based on annual report data for the time period 2005–2014 drawn from the Morningstar database; observations = 10; all p-values < 0.01 (two-tailed), which indicates highly significant results.

As mentioned, Sridhar et al. (2014) observe in their study on innovation, leaders based on financials that R&D expenditures and revenue are correlated moderately high with[19] r = 0.691, with a significance of p < 0.05. Out of this result they conclude that a firm's R&D intensity is the explanatory variable for firm performance in the longer term, at least in the case of the high-technology industry[20].

The question occurs whether R&D expenditures determine market success indicated by revenue growth or vice versa. Because it could also be the case that companies follow a relatively static approach in budgeting R&D expenditures, depending on revenue growth as a more or less fixed share of revenue. This assumption may be supported by a simple comparison, for example, between the high-technology company Apple and two car manufacturers, Fiat and Honda, which are not notorious for innovativeness, as the first step to developing a determining variable with a higher forecasting ability and a clear causal link.

If one compares the correlations between the R&D costs and performance metrics of Fiat and Honda, it appears that the correlations between R&D expenditures and revenues and R&D expenditures and intangible assets is as high as in the case of Apple (fig. nr. 2).

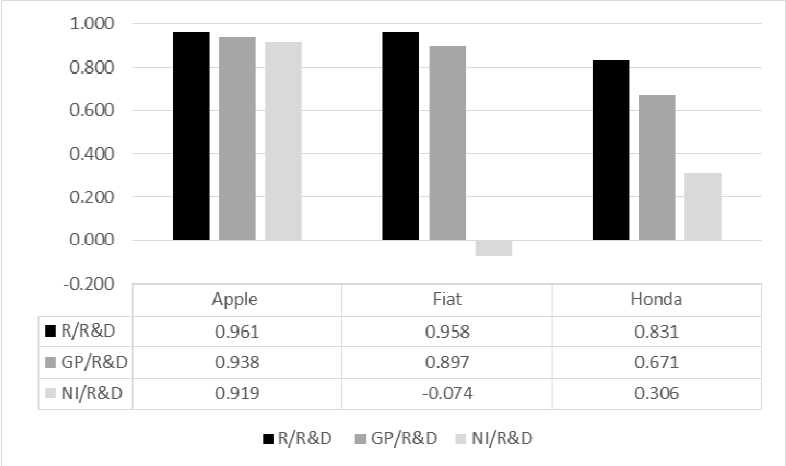

Fig. 2. Correlations between R&D Costs and Performance Indicators for Fiat, Apple, & Honda (2005–2014)

Data Source: Revenue, intangible assets, gross profit, and net income from Morningstar Database.

Note: R = revenue, IA = intangible assets, GP = gross profit, NI = net income.
Source: Own calculation based on annual report data for the time period 2005–2014 drawn from the Morningstar database; observations = 10 for each company; $p < 0.05$ (two-tailed) for all coefficients except Honda NI/R&D with $p = .38$ and Fiat NI/R&D with $p = .83$.

Based on the results of Sridhar et al. (2014), Fiat and Honda are also high-innovative companies. Fiat shows the same pattern as Apple. Revenue and R&D expenditures are in both cases equally highly correlated as well as R&D expenditures with intangible assets and R&D expenditures with gross profit. Instead, Fiat and Honda are not able to convert R&D expenditures in net income to the same extent as Apple, although Fiat is also able to convert R&D expenditures into intangible assets and gross profit to almost the same extent as Apple. This raises first the question of which is the relation between revenue and R&D expenditures, and then the question of whether the relation between R&D expenditures and net income is more revealing to determine the innovativeness of a company, because as mentioned, it does not matter how inventive a company is; however, what matters is if the company is able to convert inventiveness into innovativeness, which is the conversion of ideas and invention into commercializable and profitable products. Innovation is not only the ability to develop new products and product features, but to convert these innovations into market success respectively firm performance. Mendes dos Reis[21] conclude, by comparing Apple and Fiat, that both companies may have the same degree of inventiveness, but differences in their supply chains' flexibility lead to differences in firm performance, which lead to better sales management in the context of product life cycles. This assumption can be verified by Fiat's correlations (see Fig. 2). Fiat is able to convert at least R&D expenditures, but not into net income, which means that somewhere in the value chain, cash 'gets lost'. Thus, it becomes apparent that inventiveness does not necessarily lead to market success and that innovation is not only a product of R&D, but of the management of the whole value chain with the purpose of generating profit. Therefore, it is necessary to follow the value chain starting with R&D expenditures through intangible assets to net income. In the case of Apple and Fiat (fig. nr. 2), it becomes apparent, that Fiat loses innovation momentum along the value chain, namely much more than Honda. Based on this value flow, it seems appropriate to use a different measure, as the most of the innovation/firm performance studies do.

However, a correlation indicates, at first, only a relationship and not the direction of the relationship. In this case, it is also possible that the increase in revenue also leads to an increase in R&D because more cash is available to finance R&D investments. Also the converse assumption is plausible: Innovation increases sales opportunities and allows higher prices, which may lead to an increase of revenue. Instead, in the case of Fiat, revenue is highly and significantly correlated with R&D expenditures and also intangible assets, but not with net income whereas R&D expenditures are also highly correlated with intangible assets (Table 1). This, at least, shows that Fiat generates intangible assets out of R&D expenditures and even gross profit, but not a higher net income (Table 1).

	Revenue	**R&D**	**Net Income**	**Intangible Assets**	**Gross Profit**
Revenue	1.000				
R&D	0.958*	1.000			
Net Income	-0.056	-0.074	1.000		
Intang. Assets	0.948*	0.925*	-0.266	1.000	
Gross Profit	0.970*	0.897*	0.118	0.878*	1.000

Table 1. Bivariate Correlation Matrix for Fiat
Source: Own Calculation; Note: * $p < 0.05$ (two-tailed).
Data Source: Revenue, intangible assets, gross profit, and net income from Morningstar Database.

It becomes apparent that the simple correlation of R&D and revenue neither indicates innovativeness nor explains firm performance, as the mainstream of empirical innovation studies mentioned above suggests. As the case of Fiat and Apple shows, both companies show a high correlation between revenue and R&D expenditures. The higher R&D expenditures are, the higher is the revenue. According to the studies mentioned above, this represents evidence that R&D leads to firm performance. Fiat shows an increase in revenue but not in net income, which is, under the bottom line, a more relevant measure to determine the relationship between R&D and firm performance because, as it was argued, innovation is only as 'good' as long it creates profit and thus firm value.

III. Developing a Predictor Measure to Predict Firm Performance

Therefore, it seems appropriate to reflect on a more sophisticated measure to explain the relationship between product innovation and firm performance, because it is apparent that the correlation between revenue and R&D does not explain that innovation leads to firm performance. This means also that R&D expenditures are not a predictor for firm performance. The simple case study above shows that R&D is only somehow correlated with revenue. However, neither the direction nor the relevance of the correlation of both variables to determine firm performance is plausible. Instead, it occurs even with the assumption that revenue only predicts R&D expenditures and not vice versa, so that it remains unclear what´s the dependent and the independent variable. Furthermore, following the concept that innovation not only invents new product features or new products, but generates cash, leads to the requirement that first of all, the measure for firm performance must be different and that another predicator variable must be found.

Haric et al. show in their success factor study, based on the so-called hidden champions, that the high performance of these companies depends not on breakthrough innovation but on incremental permanent product innovation in little steps[22]. Haric defines hidden champions ('unofficial winners') as medium-sized companies, which are European or world leaders in niche markets or niche segments of larger markets. They are 'secret winners' because they usually are not public companies and therefore hardly known, because they are not observed by analysts, investors, or the media. The niche markets they occupy are so small in terms of sales volume that they are usually not recognized by larger international companies so that the competition intensity is also very low in these market niches. They were able to occupy these niches due to their customer-driven and thus focused innovativeness and, therefore, they are highly profitable companies, although, or precisely because they are not breakthrough innovators[23]. This is due to that fact that Haric et al. state that the ratio between R&D and net income (NI/R&D-ratio) is higher than in larger companies with a mass market focus and a cost–leadership strategy[24].

The NI/R&D-ratio expresses to which extent a company is really able to realize added-value in terms of net income from one dollar spent in R&D. Thus, a ratio of 1 means that one dollar spent in R&D generates one dollar of net income (NI). Although this ratio depends on many other variables such as process efficiency, supply chain management, etc., it shows how much of innovation spending is really converted along the value chain into profitability. Thus, Apple, for example, shows an NI/R&D ratio of 6.5 for 2014, which means that one dollar spent for product innovation generates a USD 6.5 ratio in net income (see Table 2).

	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Net Income	1,335	1,989	3,496	4,834	8,235	14,013	25,922	41,733	37,037	39,510
R&D	534	712	782	1,109	1,333	1,782	2,429	3,381	4,475	6,041
R&D/ NI Ratio	2,50	2,79	4,47	4,36	6,18	7,86	10,67	12,34	8,28	6,54

Table 2: NI/R&D-Ratio Calculation for Apple (2007-2014)
Source: Own calculation and presentation.
Data: Net income and R&D expenditures from Morningstar Database.

Thus, the NI/R&D-ratio reflects the ability to realize net income from innovation, which depends not only on 'invention' but on implementing added-value along the whole value chain out of innovation, because innovation, to repeat it, is only relevant when it creates net income. The relevance of this ratio also becomes apparent in comparing the NI/R&D ratios of Honda, Fiat, and Apple (Fig. 3).

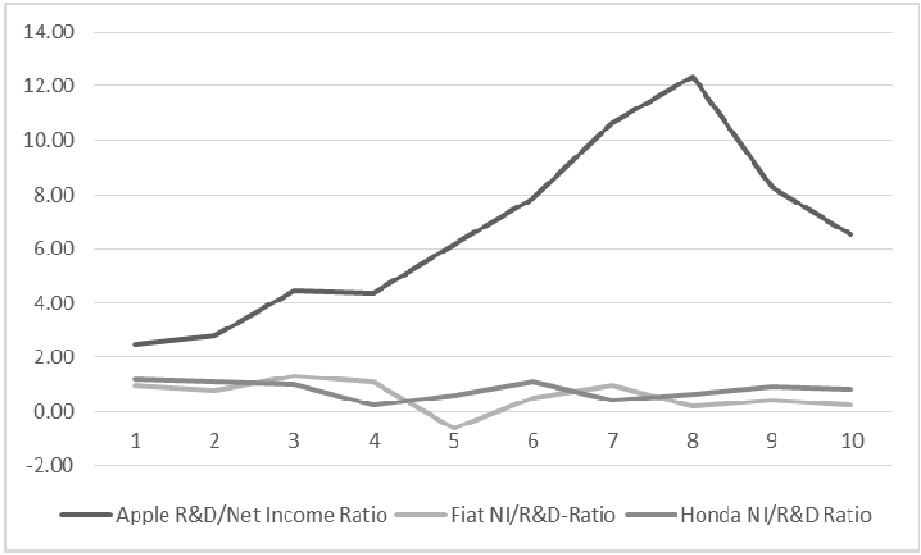

Fig. 3. Comparison of NI/R&D Ratios of Honda, Fiat, and Apple
Source: Own calculation and presentation.

Figure No 3 encourages the assumption that the NI/R&D ratio 'makes a difference' in measuring innovativeness and may indicate much better the difference between high-innovative companies and other non-innovative companies. The question remains regarding whether this indicator may also serve as a predicator of firm performance. Because, if the NI/R&D ratio can also predict firm performance, then the ratio can confirm that innovativeness in terms of being inventive and being able to transform innovation into marketable products, such as Hausschildt has defined[25]. It really makes a difference in firm performance.

According to Hawawini and Viallet[26] the capacity of the firm to create value is mainly driven by the profitability of its business whereas profitability is measured as return on invested capital (ROIC). Therefore, the ROIC is the worldwide commonly used measure of firm performance in management[27] and investment analysis. If one calculates the correlation coefficients for Fiat, it becomes apparent, that neither revenue or R&D expenditures nor intangible assets or gross profit explains the profitability and thus the capacity of value creation of the company (Table 3).

	NI/R&D Ratio	Revenue	R&D	Net Income	Intang. Assets	Gross Profit	Revenue Growth YoY
ROIC	0.942**	-0.252*	-0.289**	0.929**	-0.462*	-0.061**	0.264**

Table 3: Correlations for Fiat Key Figures (2005-2014)
Source: Own Calculation; Note: * $p > 0.05$, ** $p < 0.01$ (two-tailed).
Data Source: Revenue, intangible assets, gross profit, and net income from Morningstar Database.

However, the correlations between the NI/R&D ratio or net income and the ROIC are high (0.942 and 0.929) and significant ($p < 0.01$). This is not surprising at first, if one considers the ROIC formula which is

$$ROIC = \frac{Net\ Income - Dividends}{Total\ Capital}$$

Therefore, it is first of all, consequently compelling logic that the ROIC is highly correlated with net income and the NI/R&D ratio. The difference between all three measures is the ROIC calculates the profit of a dollar of the total capital invested. Thus, for example, Fiat's ROIC of 1.33 in 2014 indicates that the company's management generates from one dollar of the company's total capital invested only USD 0.0133, whereas Apple's ROIC of 26.2 (2014) signals that the company's management generates USD 0.25 of every dollar of the total capital invested.

The interpretation of the correlations of Tab. 3 reveals that the NI/R&D ratio explains 94% of the total profitability of a company, whereas the net income explains 'only' 92% of the profitability. The conclusion is that Fiat's R&D expenditures do not have a high impact on the company's profitability because the range between both correlations is very small. This is also supported by the low correlation of -0.289 between R&D expenditures and Fiat's ROIC.

Instead, in the case of Apple, the results are highly different. This applies first for the variables gross profit, intangible assets, and revenue growth, which shows a relatively high correlation with the ROIC whereas the correlations in the case of Fiat indicate that these variables have no effect on Fiat's ROIC.

	NI/R&D Ratio	**Revenue**	**R&D**	**Net Income**	**Intang. Assets**	**Gross Profit**	**Revenue Growth YoY**
ROIC	0.923**	0.456*	0.269	0.549**	0.500**	0.522*	0.656**

Table 4: Correlations for Apple Key Figures (2005-2014)
Source: Own Calculation; Note: * p > 0.05, ** p < 0.01 (two-tailed).
Data Source: Revenue, intangible assets, gross profit, and net income from Morningstar Database.

These differences between Fiat and Apple can be interpreted as follows: Neither the intangible assets, nor the gross profit or revenue have any effect on Fiat's profitability (see table nr. 3). This means, that Fiat's revenue growth is not really profitable, and the build-up of intangible assets does not generate any profit. On the contrary, the correlation of -0.462 in the case of Fiat shows a moderately negative effect of intangible assets on the ROIC as well as R&D expenditures on ROIC with -0.289.

Instead, Apple was able to convert its investment into R&D in profit. Whereas R&D expenditures explain 7% of the ROIC variance (r = 0.269; r2 = 0.072), intangible assets explain 25% of the ROIC variance (r = 0.500). The relationship seems intuitively logical. R&D activities creates intangible assets such as patents, trademarks, brand value, etc.

III. Research Design Conclusions

What´s more relevant concerning the testing of the NI/R&D ratio is the fact that Apple's net income explains only 30% (r2 = 0.301) of the ROIC variance, whereas the NI/R&D ratio 85% (r2 = 0.851) of the ROIC variance, whereas the range between Fiat's NI/R&D ratio (r = 0.942; r2 = 0.887; explained variance = 88%) and its net income (r = 0.929; r2 = 0.863; explained variance = 86%) is very small. To remind once again, both ROIC and the NI/R&D include net income as a factor, so that generally a higher correlation is expected. All the more important is the fact that net income does not explain Apple's ROIC, but the NI/R&D ratio does. Therefore, the assumption is that the NI/R&D ratio expresses the value contribution of innovation in the case of Apple. This is all the more obvious in the face of the explanation power of Apple's R&D and intangible assets as independent variables (see Tab.4) and their correlations with the ROIC.

However, these results show that in both cases, the NI/R&D ratio is comparably high, which can be explained by the fact that the ROIC and the NI/R&D ratio is calculated based on net income whereas the range between the NI/R&D-ROIC correlation and the net income/ROIC correlation in both cases

is extremely different. This leads to the assumption that the range between both correlations may be the value to differentiate between innovative and non-innovative companies. Based on this concept, the second part of this conceptual paper will test the difference between the NI/R&D-ROIC correlation and the NI/ROIC correlation as a predicator with a larger sample from one industry. The hypothesis is that this profitability–innovation predicator (PI predicator) allows the prediction of firm performance due to the firm-specific innovativeness. The profitability–innovation predictor is defined as:

$$PI\ Predictor = NI\text{-}R\&D\text{-}Ratio/ROIC\ Correlation - NI/ROIC\ Correlation$$

Where:
NI – Net Income
R&D – Research and Development
ROIC – Return on invested capital

The hypothesis to be tested is: The PI predictor, calculated on a previous 5-year period, predicts the firm performance of the consequent 5-year period. The assumption is: The higher the PI predictor in the period year 1 and year 5 (y1-y5), the higher is a company's net income and ROIC in the period year 6 and year 10 (y6-y10). This test will be conducted in the second part of this conceptual paper.

Social and Environmental Risks: The Role of Board Members

Faizah Darus, Accounting Research Instutute (ARI),Faculty of Accountancy, Universiti Teknologi MARA, Shah Alam,Selangor Malaysia, faiza634@salam.uitm.edu.my

Tamoi Janggu, Faculty of Accountancy, Universiti Teknologi MARA, Sarawak, Malaysia, tamoi@sarawak.itm.edu.my

Abstract

Corporations are increasingly being pressured to manage their business risks including their social and environmental risks. The aim of this study is to examine the extent to which plantation companies in Malaysia address their social and environmental risks and the role of the board of directors in motivating the disclosure of risk management information. The agency theory was used to underpin arguments for the study. Content analyses of the annual and sustainability reports of forty (40) public-listed companies in the plantation industry for the year 2013 was undertaken to examine the quantity of risk management disclosure among these companies. The data for the multiple regressions was analyzed using the Structural Equation Modelling technique of Partial Least Squares (SEM-PLS).

The results of the study revealed that for social risks, *Community Involvement* issues were the most disclosed item while for environmental risks, the companies were concerned with *Pollution Abatement/Environment awareness* risk management issues. The findings from the study revealed that board professionalism was significant in inducing management to provide risk management information to stakeholders. However, board interlock and board size were not significant drivers motivating risk management disclosure. The findings from the study suggest that the professionalism of board members is critical to guide managements towards revealing risk management information. The findings from the study provide evidence that plantation companies in emerging economies such as Malaysia are becoming concerned about the social and environmental impacts of the palm oil plantation to the community and are taking steps to address these issues.

Keywords: Corporate Governance; Social and Environmental Risks Management; Board Characteristics

1. Introduction

The governance of an organization is normally related to its policies, organizational structures and procedures by which the organisation is administered and manages itself both internally and externally. The Cadbury Committee (1992) viewed corporate governance as "the system by which companies are directed and controlled' (p.15). With the increasing importance of corporate social responsibility (CSR) in today's business environment, organisations have no choice but to include social and environmental risks management as part of their enterprise risk management system. Therefore, the scope of corporate governance of an organisation today has expanded to include managing the social and environmental risks management system. The board of directors of an organisation as the highest governing body has a critical role to play in the governance of an organization including managing the social and environmental risks. This is because the board of directors as agents has the duty of making sure that management of the organisation is behaving in a way that will provide the optimal value for shareholders (Coles et al., 2001) to ensure that the firms' activities are aligned with the set objectives of the organisation. The board of directors is therefore required to direct and monitor the activities of top management as such activities have been argued will be able to improve the quality of the managers' decisions (Monks and Minow, 1995).

Therefore, one critical aspect of the role of the board members relates to overseeing risks management system as such risks management system will ensure that the organisations will not be exposed to excessive financial and business risks that could result in the organisation becoming financially distressed. Anderson and Anderson (2009) pointed out that an effective risk management system will enable an organization to reduce the negative effects of various risks both quantitative and qualitatively. They argued that a proper risk management implementation enables an organization to respond to the adverse effects caused by various risks and furnishes a steady stream of business opportunities that can reduce the volatility in corporate earnings. However, despite the emergence of social and environmental risks in today's business environment, risks mitigation system involving such risks are still ignored by many organisations where they still do not spend time in planning risk mitigation strategies relating to such risks for their organisations. Therefore, the focus of this study is to examine the extent to which plantation companies in Malaysia address their social and environmental risks management issues and the role of the board of directors in influencing the quantity of disclosure of social and environmental risk management information. Such study in the context of an emerging economy such as Malaysia is still lacking even though the emergence of such risks are becoming more prevalent especially in plantation industries.

The aim of this study is to examine the extent to which plantation companies in Malaysia address their social and environmental risks management issues and the role of the board of directors particularly board characteristics in motivating the disclosure of risk management information by plantation companies in Malaysia for the year 2013. In this context, it is expected that the board of directors as agents for the shareholders will be motivated to disclose the social and environmental risks management information in their corporate reports to reduce information asymmetry and to ensure greater transparency. Therefore, the agency theory is used to underpin arguments for this study. The focus of this study is on the plantation industry where such industry is subjected to a higher degree of social and environmental risks and is expected to provide more information in their corporate reports relating to social and environmental risks. In summary, this paper seeks to answer the following two questions:

- To what extent do the plantation companies in Malaysia address their social and environmental risks?
- What is the relationship between board characteristics and the disclosure of social and environmental risks management information?

The findings of this study will help to identify the gaps that may exist between the role of the board of directors in determining the risks information disclosed. Despite the importance of the disclosure of risks management information to stakeholders for decision making purposes specifically in relation to equity and debt investment decisions, prior research reveals that the amount of disclosure of risks information in corporate annual reports remains inadequate (Ntim et al., 2013; Taylor, 2011). This is especially for studies on social and environmental risks disclosure.

The remainder of this paper is organized as follows. Section 2 discusses the literature review and hypotheses generation. Section 3 discusses the research methodology. The research findings are reviewed in Section 4. The final section highlights the conclusion and implications of the results.

2. Literature Review and Hypotheses Generation

2.1 Agency Theory

Agency theory has been widely used in empirical research published on the subject of board of directors. Therefore, corporate governance problems may arise when there are two parties who are involved, the managers as agents and the shareholders as principals where there is no substantial reason to believe that the managers will always act in the shareholders' best interest (Jensen and

Meckling, 1976). Therefore, it is the responsibility of the board to represent the shareholder's interests. Jensen (1993) also argues that the board of directors is crucial to ensure the effectiveness of a company's internal control systems:

"The problem with corporate internal control systems starts with the board of directors. The board, at the apex of the internal control system, has the final responsibility for the functioning of the firm. Most importantly, it sets the rules of the game for CEO" (Jensen, 1993, p.862).

Therefore, since risks management is part of the internal control system of an organization, the role of the board of directors is critical in ensuring that the organisation considers and develops a system to mitigate all types of risks that it is exposed to including social and environmental risks.

2.2 Social and Environmental Risks

In the current business setting, organisations cannot afford to ignore social and environmental issues if they are to survive and succeed in the current environment because these are emerging risks area that are of growing importance in an increasingly global economy. The traditional risk management framework does not address corporations' exposure to social and environmental risks such as the implications of emitting greenhouse gases and the global increase in carbon dioxide emissions. As a result, many new frameworks on risks have been developed to incorporate social and environmental concepts into businesses, namely, social, governmental and political systems. For example, Knott and Fox (2010) presented a model which enable users to follow a structured assessment process that integrates sustainability objectives and risks management technique. Delai and Takahashi (2011) also proposed a sustainability measurement system (SMS), which are designed into two phases. The first phase is to determine the steps necessary for designing SMS through an extensive sustainability and performance measurement system based on the development of literature review, whereas the second phase is to develop a comparative analysis of the eight sustainability measurement initiatives. Additionally, sustainability offers a new way of looking at risks. Sustainability, together with traditional risk identification, gives risk managers the information they need to make better informed decisions on an array of risks including social and environmental issues (AON, 2008).

2.3 Board of Directors Characteristics

An effective board of directors is expected to be able to lead and monitor the organisations appropriately. This is because in a corporate governance system directors are entrusted with the responsibilities and duties in relation to a company's affairs where they are accountable in steering the organisation to maximise shareholder's value. Of late, there is a growing number of literature that has provided evidence that the support and commitment from top leadership is essential for the enhancement of CSR initiatives (Maclean & Rebernak, 2007, Janggu, Darus, Mohamed Zain and Sawani, 2014). Such support and commitment by top leadership will result in organisations gaining competitive advantage (Guarnieri and Kao 2008). In this study, it is expected that the characteristics of board members can influence the organisation commitment to social and environmental risks management system which will subsequently lead to improved disclosure relating to social and environmental risks. In this study, board characteristics namely; board interlock, professionalism of board members in the context of their qualification and the size of the board is expected to influence the disclosure of social and environmental risks related information.

2.4 Board Interlock

Interlocking boards is a situation where board members of one organization are also elected as members of the board of other organisations. In such situation these interlocking boards form a director network to carry the knowledge and corporate practices, either bad or good, between companies (Chiu, Teoh, & Tian, 2013). This is where imitation practices could spread (Westphal et al. 2001; Brandes et al. 2006; Chiu et al., 2013). These imitation practices are more likely to happen in situation of uncertainty such as in risk management strategies relating to social and environmental risks where the strategies and mitigation practices of such risks are still new. Therefore, as interlocked directors observed social and environmental risk practices in other firms, they may adapt

such strategies and practice choices. Therefore, the first hypothesis developed for this study is as follows:

H1. Board interlock is positively and significantly related to risks management disclosure

2.5 Board Professionalism

According to DiMaggio and Powell (1983), there are two aspects of professionalisation. First, is through the formal education, either by universities or professional training institutions and second, is through professional networks, where the change of ideas and information has induced an organisation to be similar with its peers (DiMaggio & Powell, 1983, p. 152). Prior literature have found links between professionalism and the implementation of new accounting practices (Irvin 2008; Carpenter and Feroz, 2001; Touran, 2005). In this study, it is expected that formal education of the board of directors will influence their way of thinking in the context of social and environmental risks disclosure especially where there is now more emphasis in universities training on issues of sustainability. Therefore, the second hypothesis developed for this study is as follows:

H2. Board professionalism is positively and significantly related to risks management disclosure

2.6 Board Size

The relationship between board size and its effectiveness in making business decisions remains as an elusive area. For example Jensen (1993) concluded that larger board was less effective in coordinating communication and decision making and is more likely to be controlled by the CEO. However, Laiho (2011) and found that large board size are believed to be able to monitor the management better than small board size as they internalize larger part of the monitoring costs and have sufficient voting powers to influence the corporate decisions thus reducing the agency costs. Darus, Mat Isa, Yusoff, and Arshad (2015) found that the number of directors on the board influence the CSR information disclosed in companies' annual and sustainability reports. Due to the mixed findings, this study hypothesized that as risk is a critical aspect of the business operations with multitude facets; larger board size will be more effective in managing risk. Thus, the third hypothesis for this study was developed as follows:

H3. The larger the board size the higher the risks management disclosure.

3. Research Method

The sample for this study comprised of forty (40) public listed companies from the Plantation industry in Malaysia for the year 2013 which comprised of the whole population of the public-listed companies listed on Bursa Malaysia. A content analysis of the annual and sustainability reports was undertaken to determine the quantity of social and environmental risks information reported by the plantation companies. As suggested by Zeghal & Ahmed (1990), one of the limitations in using content analysis to measure disclosure quantity is the element of subjectivity involved in determining a particular type of disclosure. To overcome this limitation, the components of risks management disclosure to be investigated in this study were segregated between social and environmental disclosure and were grouped as follows:

Social risks
- human resources/workplace
- community involvement
- marketplace
- stakeholders
- occupational, safety, and health

Environmental risks
- law & regulation
- pollution abatement/environment awareness
- sustainability development/environmental commitment

- environmental management

The quantity of social and environmental disclosure was measured by the number of sentences relating to the categories disclosed. In order to test the relationship between independent and dependent variables in this study, the data was then analysed using the Partial Least Square - Structural Equation Modelling (PLS-SEM) approach using the software version 2.0 developed by Ringle, Wende and Will in 2005.

4. Results and discussion

4.1 Descriptive Analysis

Table 1 and Table 2 present the descriptive analysis of the social and environmental risks disclosure. The results revealed that for the social risks disclosure, the highest mean score was for the *Community Involvement* (10.50) followed by the *Human resources/Workplace* (6.23). The results suggest that the companies were concerned about the impact of their activities on the community and were taking steps to ensure that the risks of their business activities on the community were addressed and mitigated. The companies were also concerned about the risks exposure of the employees in the workplace. While for the environmental risks, the most disclosed item relates to *Pollution Abatement/Environment awareness* (9.03) while the least disclosed item was for the category *Law & Regulation* (1.10). Since the companies comprise of plantation companies, the effects of their operation in the context of pollution were of a major concern to the companies and they seemed to portray that they are aware of such risks and are having a proper environmental pollution abatement strategies to mitigate such risks.

Table 1: Descriptive Analysis for Social Risks Disclosures

	N	Min	Max	Mean	Std. Deviation
Human Resources/Workplace	40	0	62	6.23	13.229
Community Involvement	40	0	55	10.50	16.802
Market place	40	0	26	2.65	5.864
Stakeholders	40	0	50	2.03	8.766
Occupational, Safety, and Health	40	0	43	2.55	8.051

Table 2: Descriptive Analysis for Environmental Disclosures

	N	Min	Max	Mean	Std. Deviation
Law & Regulation	40	0	13	1.10	2.649
Pollution Abatement/Environment awareness	40	0	56	9.03	12.705
Sustainability development/Environmental commitment	40	0	31	4.05	6.441
Environmental Management	40	0	23	1.68	4.382

Figure 1 presents the mean score for the descriptive analysis of the social and environmental risks disclosure.

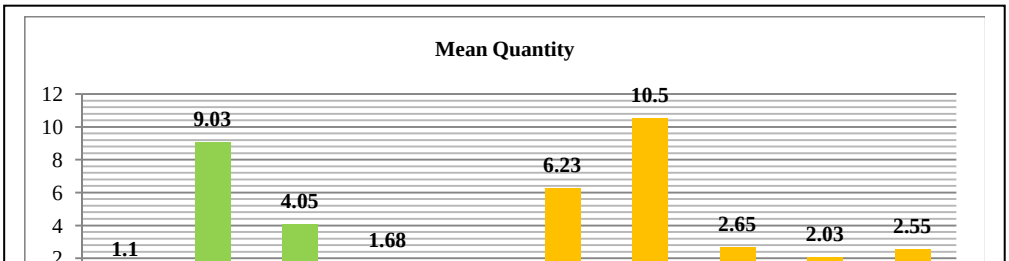

Figure 1: Mean Score for the Social and Environmental Risks Disclosure

4.2. The measurement model

Table 3 summarizes the results of the internal reliability and convergent validity for the constructs. Convergent validity was assessed based on factor loadings, average variance extracted (AVE) and composite reliability (CR) through a procedure called Fornell and Lacker, (1981). All the factor loadings were above the recommended level of 0.5 (Chin, 1998). The AVE quantifies the amount of variance that a construct captures from its indicators relative to measurement error and should be greater than 0.50 (Chin, 1998) which means that 50 percent or more variance of the indicators should be accounted for. Meanwhile CR should be greater than 0.7 as a benchmark for a "modest" reliability. This condition is satisfied for the CR and AVE as shown in Table 3.

Table 3: Measurement model

Construct	Items	Convergent validity		
		Loadings	AVE	CR
Interlock	Interlock	1.000	1.000	1.000
Professionalism	Mast	0.863	0.563	0.715
	Prof	0.617		
Size	Size	1.000	1.000	1.000
Risk	Risk	1.000	1.000	1.000

Table 4 presents the results for the discriminant validity of constructs. In order to assess discriminant validity, AVE should be greater than the variance shared between the construct and other constructs in the model (i.e the squared correlation between two constructs). Discriminant validity is said to be adequate when the diagonal elements significantly greater than the off-diagonal elements in the corresponding rows and column. This condition is satisfied as shown in Table 4.

Table 4: Discriminant validity constructs

	Interlock	Prof	Risk	Size
Interlock	SIM			
Prof	0.275	0.750		
Risk	0.187	0.415	SIM	
Size	0.410	0.205	0.198	SIM

Note: Diagonal represents the square root of the average variance extracted while the other entries represent the correlations.
SIM=Single Item Measure

Therefore, from the results presented in Table 3 and Table 4, the measurement model used demonstrated adequate reliability, convergent validity, and discriminant validity.

4.3 The structural model

Figure 2 presents the explanatory capacity of the structural model for the study. The structural model indicates the causal relationships among the constructs in the model, which includes the estimates of the path coefficients and the coefficient of determination, R^2 value. Together, the R^2 and path coefficients (loadings and significance) indicate how well the data support the hypothesized model (Chin, 1998). The R^2 value for the relationship between the independent variables and risk management disclosures was 0.187 which indicates that 18.7% of the variance in risk management disclosures can be explained by board characteristics.

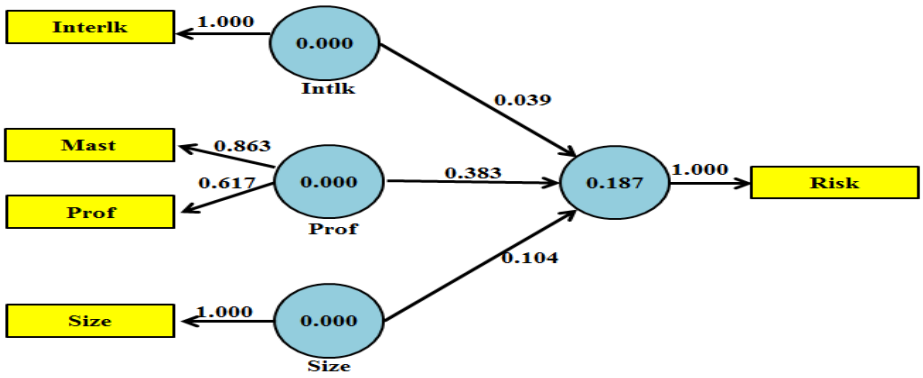

Figure 2: Explanatory capacity of the structural model

Table 5 presents the results of the hypotheses testing. The results from Table 5 revealed that the professionalism of the board of directors is significant with risk management disclosure. Therefore, H2 is supported.

Table 5: Result of Hypotheses Testing

Hypotheses	Path coefficient	Beta	SE	t-value	Decision
H1	Interlock -> Risk	0.039	0.173	0.223	Not supported
H2	Prof -> Risk	0.383	0.150	2.551**	Supported
H3	Size -> Risk	0.104	0.165	0.632	Not supported

**p<0.01 (t-value > 2.33)

The results of the study imply that even when board members of one organization are also elected as members of the board of other organisations, such practices are not facilitating the social and environmental risks management strategies between the organisations. This finding therefore does not support arguments made by (Chiu, Teoh, & Tian, 2013; Westphal et al. 2001; Brandes et al. 2006) where in such situation imitation practices were argued to be more likely to happen. The insignificant results could be because the interlocking directorships were on board of companies where good social and environmental risks management strategies have not been put in place resulting in non-imitation practices. Therefore, H1 is rejected. Similarly, the result for H3 reveals that the size of the board is not significant in the context of this study. Therefore, the size of the board plays no role in determining the risk management strategies relating to social and environmental disclosure. This findings is contrary to previous studies done between board size and CSR disclosure where the results of these studies reveal that board size is a predictor of CSR reporting (Said et al. (2009; Darus et al. 2015).

With regards to professionalism, the results from H2 imply that companies whose board members are professionally qualified will facilitate the organisations to address issues of social and environmental risks management. The findings are therefore consistent with prior literature that have found links between professionalism and the implementation of new practices (Irvin 2008; Carpenter and Feroz, 2001; Touran, 2005). Therefore, H2 is accepted.

5. Conclusion

The aim of this study is to examine the extent to which plantation companies in Malaysia address their social and environmental risks management issues and the role of the board of directors particularly board characteristics in motivating the disclosure of risks management information for the year 2013. The agency theory was used to underpin arguments where the board of directors as agents would be motivated to disclose the social and environmental risks management information in their corporate reports to reduce information asymmetry and to ensure greater transparency. The results of the study revealed that for social risks, the plantation companies were concerned with *Community Involvement* issues and were taking steps to ensure that their business activities were not causing harm to the community. While for the environmental risks, the companies were concerned with *Pollution Abatement/Environment awareness* risk management issues. This is consistent with the nature of the plantation companies where the effects of their operation may cause harm to the environment and as such they seemed to be taking the necessary steps to address this issue by having proper environmental pollution abatement strategies to mitigate such risks.

Further statistical analysis revealed that board professionalism is a determinant for risk management disclosures. However, board interlock and board size was found to be insignificant. The results suggest that professionalism of the board of directors supports the organization in addressing issues of social and environmental risks management system which is a new risk management area especially in an emerging economy such as Malaysia. The insignificant results for board interlock in this study merits further investigation. This is because interlocking directorships in companies with poor social and environmental practices could instead result in imitation of poor social and environmental practices resulting in poor reporting practices.

One of the biggest challenges for plantation companies in Malaysia is to ensure that their operations do not take place at the expense of the natural ecosystems because the palm oil industry is vital to the economy of the nation. This study provides empirical evidence that the plantation industry in Malaysia are taking steps to safeguard the social and environmental impact of their business operations by protecting the community rights and undertaking pollution abatement strategies as an integral part of the plantation management system. This is where the board of directors as agents needs to play their roles to ensure that the best interest of the shareholders as principals of the organisations are being upheld.

Abstract

This paper highlights a model for determining the cost and benefits (CBA) analysis of a green fertilizer technology development research program in Malaysia. A five-stage process model for the Cost-Benefit Analysis is developed to focus on the value of several projects undertaken within the research program. The five stages of the CBA model are to: (i) identify the deliverable of each project; (ii) identify the advantages and disadvantages (opportunity cost) of each deliverable; (iii) qualify the advantages; (iv) quantify the advantages and; (v) monetize the advantages. The above-mentioned five stages CBA model has helped researchers to monetize the direct and indirect benefits expected to be delivered by the green fertilizer technology development research program.

Keywords: Cost Benefit Analysis, Green Fertilizer Technology Development, OneBaja.

I. Introduction

Agriculture industries play an important role in the Malaysian economic development and supply many job opportunities for the society (Fahmi et al., 2013). To enhance the agriculture production and to get optimum plant growth, nutrients must be accessible in sufficient and balanced amount (Chen, 2006). The recovery in agriculture production, underpinned by a significant improvement in paddy output, had supported the economic growth even during the 1998 financial crisis (Wang and Chien, 2007).

Nevertheless, the traditional method of agricultural farming in which chemical-based fertilizers are heavily used has contributed to increased global warming and greenhouse effect. In tandem with this, a group of researchers from several public and private universities in Malaysia has embarked on a research program named as **"OneBaja"**. The primary objective of the OneBaja research program is to develop a green fertilizer technology by featuring a green production of ammonia as well as a controlled-release mechanism of urea for paddy farming fertilizer. The aims of this research program are: (i) to model and synthesize ammonia and urea in a magnetic induction reaction zone with the presence of catalyst and catalyst support; (ii) to design multi-functional layers of biodegradable granulated urea and to develop a new coating formulation material to increase nutrient uptake; (iii) to systematically model the process design of Enhanced Efficiency Fertilizer (EEF) plant as well as to calculated the energy saving of the new system; and (iv) to run efficacy test on the newly developed EEF products and to conduct some economic impact analysis via stakeholder communication.

To achieve the above mentioned objectives whose ultimate goal is to produce a green fertilizer technology in the form of Control Release Fertilizer (CRF), the research program is broken down into seven sub research projects as shown in Figure 1. **Project 1** to **6** are related to technology developing, engineering and sciences, while **Project 7** of the OneBaja research program relates to stakeholders communication strategy as well as social and economic analysis. (Refer to Fig 1)

As such, this paper highlights the economic analysis performed in **Project 7** of the OneBaja research program by developing a Cost-Benefit Analysis (CBA) model for four out of seven projects under the green fertilizer technology development research program mentioned above. CBA is crucial to ascertain the benefits and value of the expected deliverables of the OneBaja research program. As such, this paper develops a 5-stage CBA model for the computation of the costs and benefits for the projects under examination. The 5-stage CBA process model is shown in Figure 2.

II. Literature Review

A. A Case of Green Fertilizer Technology in the form of Control Release Fertilizer (CRF)

The world-wide concern about worsening environmental conditions necessitate the need for eco-friendly agriculture products (Hashim and Ho, 2011). Green technology policy refers to the development and application of products, equipment and systems used to converse the natural environment and resources which minimizes and reduces the negative impact of human activities (Hashim and Ho, 2011). The continual application of traditional fertilizers in Malaysian paddy production has been creating adverse environmental impact with negative social consequences. The development of an eco-friendly fertilizer is hence timely and appropriate. Green fertilizer technology in the form of control release fertilizer (CRF) has numerous advantages. These advantages are:

i. it increases fertilizer efficiency and crop yield,

ii. it reduces losses of nutrients through leaching, runoff, volatilization, and denitrification,

iii. it saves time, cost, and labor in reducing the frequency required for fertilizer application compared to the conventional method,

iv. it synchronizes the release of all macro- and micro-nutrient in the soil necessary for crop plantation, and

v. it eliminates the risk of nutrients deficiency or scorching.

B. Cost Benefit Analysis (CBA)

To ensure investment in the projects are successful and creating value to stakeholders, it is crucial for the project owner to perform a thorough cost benefit analysis (CBA) (Holland, 2012), (Cervone, 2010). There is no a single or standard model for the CBA. Cost Benefit Analysis is a broad form of economic evaluation and it has been used as an aid to decision making in many different areas of economic and social policy in the public sector during the last 50 years (Wen & Chen, 2008). It has been widely used in integrated economic and environmental assessments (Mishan & Quah, 2007). The hallmark of CBA is that costs and benefits are expressed in monetary terms so that they can be directly compared to other similar or competing projects (Robinson, 1993), (Hastings, 2015), (Pearce, 1998).

C. The OneBaja Research program and its 7 Projects

The OneBaja research program is broken down into 7 separate but interrelated projects. The expected deliverables for each project are: **Project 1:** *a novel magnetic induced reaction for green ammonia-urea synthesis*; **Project 2:** *formation of iron fused oxide nanotubes catalyst system for green urea production*; **Project 3:** *green processing of biodegradable urea granules*; **Project 4:** *multifunctional layers of controlled release fertilizer for greener environment*; **Project 5:** *Enhanced Efficiency Fertilizer (EEF) urea on crop production and the environment*; **Project 6:** *integrated computational fluid dynamics (CFD) analysis and design optimization for green urea processing*; and **Project 7:** *socio-economic impact analysis and stakeholder's communication strategy*.

Specifically, Project 1 of OneBaja program deals with synthesizing and developing a new ammonia/urea process using One-Step approach in a magnetic induction reaction zone. Project 2 performs integrity studies of metal oxide fused oxide nanotube catalysts for green urea production. Project 3 synthesizes biodegradable binder for urea granulation. Project 4 formulates a new multifunctional controlled released for green EEF. Project 5 carry out efficacy test on the newly developed EEF of the Green fertilizer. Project 6 deals with design of Nano-mixer for Green Urea Production using Computational Fluid Dynamics (CFD). Whilst project 7 of OneBaja program

focuses on sociology, economic analysis, stakeholder's communication and market segmentation analysis of EEF application.

Figure.1: Green Fertilizer Technology Development Research Program

III. Stages of Cost Benefit Analysis Model

This paper highlights a model for determining the cost and benefit analysis of a green fertilizer technology development research program (OneBaja) mentioned earlier. The CBA model is developed to identify, qualify, quantify and monetize the benefits of each separate but interrelated project undertaken within the OneBaja research program. The developed CBA model comprises five stages of process flow as shown in Figure 2:

Stage 1 and **Stage 2** involves data collection through interviewing the respective project leader and research officer to validate the deliverables of each project undertaken. Two questions were asked in these stages, namely;

i. what are the expected deliverables for this project?

ii. what are the advantages and disadvantages (opportunity cost) of these deliverables vis-a-vis the existing method of farming in the context of its fertilizer application.

The obtained information from the interview was used as input for analysis in **Stage 3** and **Stage 4** of the CBA model, i.e. qualification and quantification of the value of the expected deliverables. Lastly, in **Stage 5**, the value from Stage 3 and 4 were used to determine the monetary value of the cost and benefits of the expected deliverables of each project.

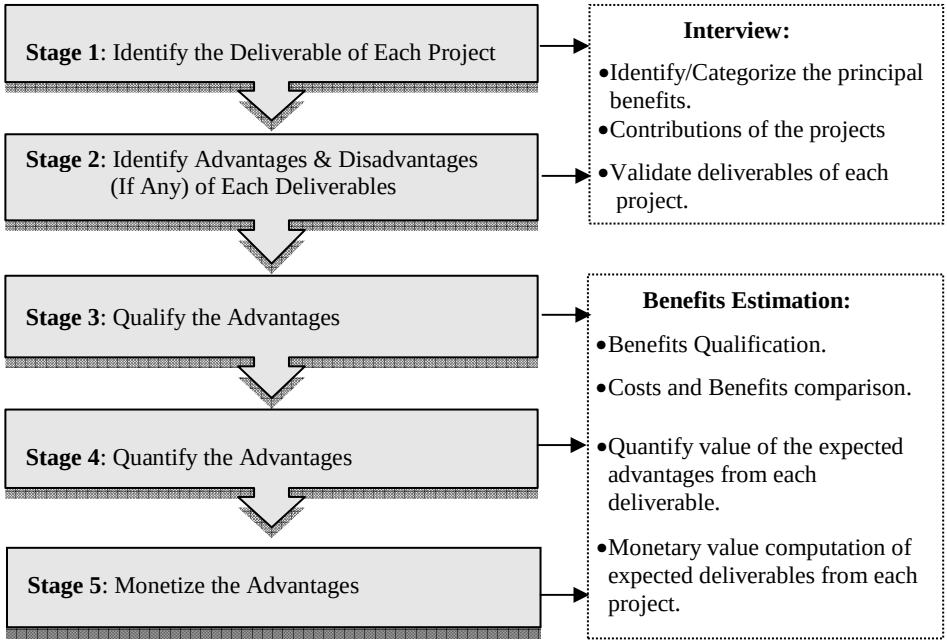

Figure 2: Cost Benefit Analysis Process Model

IV. CBA Examination

Although there are seven separate but interrelated research projects under the OneBaja research program, the CBA examination is only performed on Project 1, Project 2, Project 3, and Project 4, of the green fertilizer technology development research program. Project 5 is found to be irrelevant for the CBA examination due to the nature of its research as it involves soil testing. Whilst Project 6 relates to catalytic computational flow simulation. Project 7 is also excluded from the CBA as it involves economic, social and stakeholder's communication strategy. The ensuing section describes the CBA examination for project 1, 2, 3, and 4 based on the model presented in Figure 2.

A. CBA Examination on Project 1

Project 1 deals with the production of ammonia by applying magnetic field at ambient conditions using a nanocatalyst. α -Fe_2O_3 nanowires were developed and the effect of activation energy with and without magnetic field were studied. The kinetic models for ammonia and urea synthesis reactor were developed and simulation of both process were carried out.

Stage 1 of CBA identified three deliverables which are; (i) established a new model for Thermo-magnetic induction reaction system, (ii) enhanced One-Step NCZ urea synthesis method, and (iii) a concept design of an integrated ammonia/urea processes.

Stage 2 identified the advantages in that the production of ammonia by applying magnetic field at ambient conditions and by using nanocatalyst could reduce the energy consumption and time duration.

Based on the above, *Stage 3* qualified that the amount of nitrogen needed for the production of ammonia could be reduced by half from 120kg to 60kg to produce a given level of urea-based fertilizer, e.g. for the production of 3 tones paddy crop yield per season hectare.

As a result, *Stage 4* computed that, based on the total fertilizer needed in a year for the paddy plantation in Malaysia (2.5 plantation seasons per year and 688,207 total hectarage), the green ammonia production technology developed in Project 1 is able to reduce the usage of nitrogen amounting to 103,231,050 kg. Converting 50% of this amount to nitrogen oxide (N_2O), it is equivalent to 51,615,525 kg reduction of N_2O or further conversion to 16,000,812 tons of CO_2, emitted into the environment.

Stage 5 monetized that, based on the global carbon trading price of 1 metric ton of CO2 = USD11, the total carbon emission offset per year is worth USD176,008,932 or RM642.8 million.

B. CBA Examination on Project 2

Project 2 deals with the formation of nanocatalyst system which comprised of catalyst support and catalyst that uses a microreactor for urea formation. Electrochemical and chemical deposition methods are used to produce the catalyst and catalyst support. The materials that were investigated are zirconia, tungsten trioxide, zinc oxide and titanium dioxide. Anodic process is selected to grow oxide support. The integrity and robustness of the material are being investigated either experimentally or by modelling.

Stage 1 of CBA process identified following deliverables; the methods and materials used for urea formation i.e. (anodization method and Thermal Oxidation method) contributes significantly on material processing technology especially the bottom up approach of nanomaterial formation, it contributes in the progression and development of knowledge in the field of nanostructured semiconducting oxides, ceramic science, catalysis and chemical engineering.

Stage 2 identified that the anodization of metal foils of zirconium, titanium and aluminum for the formation of oxide nanotube arrays will result in highly ordered alignment, and aspect ratio, their dimension can be controlled by varying anodization parameters, less chemicals are required, they are robust and crystallization can be induced at room temperature. The only disadvantage is that high level of amorphous nanotubes are produced and annealing is required.

Based on the above, *Stage 3* qualified that various methods are available to synthesize metal oxide such as anodization, sol gel, hydrothermal & template assisted method. However, in this study anodization and thermal oxidation method is chosen. These methods are chosen because they are cost effective, less time consuming simple and fast. Hydrothermal method requires high temperature and pressure, additional chemicals required in producing the metal oxide which are costly, and time consuming. Sol gel method require multiple steps and extra chemicals to synthesize metal oxide as compared to anodization method.

Stage 4 of the CBA examination estimated that for the synthesis of catalysts, room temperature and atmospheric pressure is required. Similarly, the materials needed for catalyst formation are cost effective and a very less amount is required in each case. For example, ethylene glycol costs only RM50 for 2.5 liters that could be used for at least 50 samples. An amount of only 0.3 g of ammonium fluoride is needed per 1000 g of catalyst, while the cost for 1kg of ammonium fluoride is only RM150. Power requirements and the additives used are free of cost (available in labs) in this process. Likewise, the cost for preparation of iron foils is merely RM250/50 samples.

The CBA examination on Project 2 provided the necessary information about the methods and materials required for catalyst formation. The output of this project will serve as input for value realization in Project1, 3, and 4. Therefore, *Stage 5* will not provide any monetary value per se for Project 2 (see Table 2).

C. CBA Examination on Project 3

Project 3 deals with processing biodegradable urea granules. Binder containing starch /PVA /glycerol was developed and mixed well with urea during granulation process. Optimum parameter or lab-scale fluidized bed granulator have been developed. Biochar as a highly potential binder material impregnated with urea to reduce the mineralization and retain a more nitrogenous compound in soil.

Stage 1 of CBA identified three deliverables which are; (i) designed new approach incorporating coating process within the granulation system, (ii) established self-sustain granulation process by using the ammonia waste as an energy source for the ammonia fuel cell generator, (iii) established integrated granulation-coating technology.

Stage 2 identified the advantages of using starch/PVA/glycerol and processing with biodegradable urea granules which are; it reduces the gas emission, and increases the output up to 12.73 %.

Based on the above, *Stage 3* qualified that the cost of normal urea is RM 109.40/hectare whereas, the cost of Bio-UF is RM 566.30. The difference of cost between the normal and Bio-UF is RM 456.90/hectare. The obtained information from Project 1 indicates that in Malaysia paddy plantation seasons are 2.5 and total hectarage of paddy is 688,207. By assuming rice yield per hectare is 3.82 tons. The results show that by adapting Bio-UF (new fertilizer), the yield/hectare will increase to 4.31 tons. The difference in yield/hectare between the normal and Bio-UF is 0.49 tons.

As a result, *Stage 4* computed that, in Malaysia the sale of paddy in one season is RM 1,300. By using the normal urea the sale of paddy is equivalent to RM 4,966 (rice yield per hectare is 3.82 tons using normal urea), whilst by using the Bio-UF the sale will be equivalent to RM 5,603 (rice yield per hectare is 4.31 tons using Bio-UF).

Stage 5 indicates that the paddy plantation in Malaysia=1.7 million hectare/year. The Bio-UF produced in Project 3 is able to increase the yield to 843.1 million tons/per year and the cost will also increase to RM 786.1 million/year. However, the yield will lead to a net increase in benefit value of RM 1,095.97 million/year. Hence, the total value realization using Bio-UF will be equivalent to RM 309.9 million (see Table 3).

D. CBA Examination on Project 4

Project 4 deals with multifunctional layers of controlled release fertilizer for greener environment. Tapioca starch was chemically modified with urea in the presence of borate which act as a cross linker and catalyst.

Stage 1 of CBA identified three deliverables which are; (i) Project 4 enhances new knowledge in preparation of cross linked starch and novel geopolymer and geopolymer-composite membrane for controlled release urea fertilizer, (ii) acquired new knowledge in the production of multilayer coating of new controlled release urea fertilizer using fluidized bed methods, (iii) project 4 delivered new cost effective and environmentally controlled release fertilizer for commercial production.

Stage 2 identified that by using multifunctional layers to produce controlled release fertilizer have various advantages which are; the control release fertilizer can be produced by using waste, it's cheaper, consist of waste (fly ash) and only one chemical solution (NaOH) is required, and it is non-degradable but harmless as the polymer contains the same element as in the mineral (silica and alumina).

Based on the above, *Stage 3* qualified that the cost of normal urea is RM109.40/hectare whereas, the cost of Geo-Coated urea is RM 240/hectare. The difference of cost between the normal and Geo-Coated urea is RM130.60/hectare. Based on the information from Project 1, in Malaysia paddy plantation seasons are 2.5 and total hectarage of paddy is 688,207. By assuming rice yield per hectare is 3.82tonne. The results show that by adapting new fertilizer Geo-Coated, the yield/hectare will increase to 4.31tonne. The difference in yield/hectare between the normal and Geo-Coated urea is 0.49tonne.

Stage 4 indicates that, in Malaysia the sale of paddy in one season is RM1, 300. By using the normal urea the sale of paddy is equivalent to (1300 x 3.82) RM4, 966 tons, whilst by using the Geo-Coated urea the sale will be equivalent (1300 x 4.31) to RM5, 603.

*Stage 5*computed the monetary value using Geo-Coated urea, for the paddy plantation in Malaysia (2.5 plantation seasons per year and 688,207 total hectarage), indicates that the total paddy plantation in Malaysia = 1.7 million hectare/year. The paddy yield by using Geo-Coated urea will be 843.1 million ton/year and the cost will be RM 224.7 million. However, the yield will lead to a net increase in benefits value of RM1, 095.97 million/year. Hence the total value realization using Geo-Coated Urea will be equivalent to RM 871.3 million (see Table 4).

V. Conclusion

The research summarized in this study has attempted to examine the cost and benefits of a green fertilizer technology development research program "OneBaja". The results indicated that OneBaja product is eco-friendly green fertilizer and it is economically efficient as compared to the conventional methods for domestic paddy farming. The OneBaja product is supposed to save time, cost, and labor in the application frequency of the fertilizer in paddy plantation (as it incorporates the controlled release mechanism of urea absorption by the plant). The value of the OneBaja product is further validated by the cost-benefit analysis (CBA). CBA is performed on four out of seven projects under the green fertilizer technology development research program. For instance, Project 1 of the OneBaja research program indicates that the green fertilizer which is low in nitrogen content, if applied in paddy field in Malaysia, will reduce the emission of Nitrogen Oxide (N_2O) (1 N_2O = 310

CO_2) by about 51.6 million kg per year. Project 2 provided the necessary information about the methods and materials required for catalyst formation, the output from project 2 served as an input for value realization in Project 1, 3, and 4. Therefore, project 2 does not provide any monetary value. The Bio-UF produced in *Project 3* is able to increase the yield to 843.1 million tons/per year. Hence, total value realization from *Project 3*, using (Bio-U) will increase in benefits at a value RM309.9 million. *Project 4*, the total value realization using Geo-Coated Urea will be equivalent to RM 871.3 million. In a nutshell, the CBA results show that the OneBaja product can generate the benefits equivalent to RM 1,824 million per year. (See Table 5 summary of the CBA examination.).

Table 5. Summary of Obtained results from CBA examination

Project	CBA Calculation	Remarks
Project 1	RM 642.8 million	Reduction in carbon emission
Project 2	N/A	Output from P2 served as an input to P1, P3, P4
Project 3	RM 309.9 million	Increased in benefits value by using Bio-U fertilizer
Project 4	RM 871.3 million	Increased in benefits value by using Geo-coated urea
TOTAL	**RM 1,824 million**	-

Abstract

This study investigates the effects of Corporate Governance (CG) on Corporate Social Responsibility Disclosures (CSRD) practices amongst publicly listed companies in Malaysia. The corporate governance mechanism has been proxied by board independence, board size, board meetings and board gender in understanding companies' CSRD practices. Content analyses have been carried out on the annual reports of 85 non-financial companies covering a 3-year time frame, thus a total observation of 255 company case. The evidence revealed that the studied companies have gradually improved their CSRD practices over the three-year period. Mixed results have been found concerning the links between CG mechanisms and CSRD in four dimensions i.e. Marketplace, Workplace, Community and Environment. Specifically, positive significant links have been found for board independence-community, board size-workplace and environment, board meetings-marketplace relationships. The outcome of the study signifies that the companies may have strategized for better and specific dimension of CSR disclosure practice through strong governance structure.

Keywords: Corporate governance, Disclosure, CSR dimensions, Content Analysis

1. Introduction

Malaysia, in general, is seen as one of the active countries in engaging with the global Corporate Social Responsibility (hereafter, CSR) initiatives and practices. A number of financial and non-financial supports towards local CSR-related programmes and initiatives have been carried out by the country, including CSR national awards, related policies and regulations, tax incentives as well as CSR-related reporting regulations. The introduction of the CSR Framework by Bursa Malaysia in 2006 obviously had made a positive mark towards greater business engagement in CSR management and practice in the nation, which include CSR-related reporting accountability.

CSR disclosure practices reflect companies' reporting accountability towards providing information to numerous stakeholder groups. Particularly, CSR disclosures have the potential to strengthen the bond vis-à-vis contract between companies and the society at large (Turker, 2009). Hence, these CSR-related potentials and benefits indicate the need for good governance structure in promoting greater disclosure practices (see Bayoud and Kavanagh, 2012). Accordingly, Malaysia had established the Malaysian Code of Corporate Governance 2001 (MCCG 2001) (latest revised code known as the MCCG 2012) and the Bursa Malaysia Revamped Listing Requirements 2001.

Ho and Taylor (2013) discover that the essence strength of the corporate governance (hereafter, CG) in terms of the directors and management highly influences the CSR disclosure practices. The role of CG in managing business-related pressures is be quite challenge despite the types of information that the 3rd party needs which somehow might effects the company's management behavior and maintaining customers loyalty. As mentioned by Mathews (1995), companies that develop CSR disclosure practice offer several initiatives including good social responsible information may certainly affect their market performance, where it explains the reliable of information the users reached which influence the graph of their market performance. This is supported by Turker (2009)

who states that CSR disclosure is a form of business mechanism which facilitates company's CSR performance.

Amongst the primary reasons for company's CSR disclosures are to improve company image (Ramdhony and Oogarah-Hanuman, 2012), and due to continuous stakeholders' pressures (Bayoud and Kavanagh, 2012). Particularly, Esa and Mohd Ghazali (2012) mention that the association between CSR disclosure and corporate governance may lead to long term business value thus promote efficient business operations and users acceptance. Hence, the roots of generating a high quality CSR disclosure is CG itself, which subsequently will accelerate better governance (Adam and Shavit, 2009).

Based on the above discussions, thus, this study seeks to investigate the possible links between CG mechanisms and CSR-related disclosures, particularly with a focus on the primary CSR dimensions, i.e. Marketplace, Workplace, Community and Environment. The findings of this study may offer some insights to the relevant policymakers, including the Bursa Malaysia and other regulatory and professional bodies, to improve current CSR strategies towards promoting greater CSR disclosure engagement amongst Malaysian companies. Additionally, the study findings may put forward some preliminary ideas relating to the appropriate CG aspects in enhancing specific and worthy CSR disclosures practices by the industry players.

2. Literature Review

2.1 Underpinning Theoretical Perspectives

Stakeholder theory is one of the primary theoretical perspectives found to be relevant in understanding companies' CSR-related disclosure behaviour towards fulfilling the interest and demands for information by various stakeholders (see Roberts, 1992; Hooghiemstra, 2000, Figar and Figar, 2011). Cecil (2010) argues that non-financial matters are growingly becoming crucial to the sustainable development of companies, and that disclosure practice functions as an essential approach to communicate the CSR effects of organizations' economic actions. Apart from that, disclosing CSR information signifies companies' execution of their accountability and good governance, as well as CSR-related programmes and activities for both their external and internal stakeholders. Stakeholder theory posits the dynamics of the interrelationship between a company and its business environment, which emphasised for responsibility and accountability (Gray et al., 1996). This theory affirms that:

'*…corporations continued existence requires the support of the stakeholders and their approval must be sought and the activities of the corporation adjusted to gain that approval. The more powerful the stakeholders, the more company must adapt. Social disclosure is thus seen as part of the dialogue between the company and its stakeholders.* (Gray et al., 1995, p. 53)

Stakeholder theory positions companies as the central point of stakeholders' circle of relationships. In a specific time period, a company will have relationships with two core stakeholder groups; often known as internal and external, or primary and secondary (see Freeman and Reeds, 1983; Clarkson, 1995).

Agency theory is also a relevant notion to comprehend the possible association between CSR disclosure and CG. Jensen and Meckling (1976) argue that in a business setting, there exist a contract between one or more persons (the principal/s) and another person (the agent) to perform certain matters on their behalf, thus, involves delegation of decision-making authority to the respective agent. The management is the essential group of people who has the opportunity to enter into a contractual relationship with other stakeholders; hence, they are company's 'agents' (Hill and Jones, 1992). They are also responsible (on behalf of their principals) to monitor business operations, achieve company's goals in addition to maximize shareholders' wealth. Strict control and monitoring business mechanism is an important initiative in avoiding a breach of action hence capable to control agency problems and safeguard managers' action in the best interests of their shareholders (see Ho and Wong, 2001).

CG mechanisms including board of directors are crucial for a progressive disclosure practice (see O'Sullivan et al., 2008). Frolova and Lapina (2015) contend that a successful business-CSR requires the establishment of a separate managements system i.e. an effective board of directors who supports CSR disclosure practices. Additionally, Garvare and Johansson (2010) describe the benefit of a relationship between board of directors and CSR in fulfilling stakeholders' needs and demand. From a local setting, Ho and Taylor (2013) highlight the potential of companies in Malaysia through strong CG structure to stimulate voluntary disclosure practices. In relation to this, Darus et al. (2013) conclude that larger board is relevant in mitigating agency problems caused by information asymmetry; this also influences businesses to adopt new guidelines in improving CSR initiatives.
Consequently, the literature points out the relevancy for these theories to underpin the investigation concerning CSR disclosures and CG.

2.2 CSR Dimensions

The Bursa Malaysia CSR Framework requires all publicly listed companies to clearly define their sustainability strategies and objectives, and accordingly make appropriate disclosures of company's CSR-related information. Four primary CSR dimensions that should be followed and balanced in order to reflect company's sustainability objectives include community, workplace, marketplace and environmental. Summaries for the disclosures according to these dimensions are as follows:

Community: companies' engagement with activities involving the communities, including supporting education, donations and organizing youth development programs; with the aim to create bonds with the communities and focus on their welfare and benefits.

Workplace: maintain employees' welfares towards greater productivity and quality, including quality of working environment, safety and health, and human and labour rights.

Marketplace: formulation of activities aiming to encourage stakeholders, such as shareholders, suppliers, vendors and customers to act sustainably through the value chain relationships thus support the company's sustainability agenda.

Environment: environmentally-related policies and activities involving matters of energy, bio-fuels, biodiversity, preservation of the flora and fauna as well as other sustainability business practices.

2.3 CSR Disclosure Practice: The Benefits and Links with CG

Prevailing literature has explored the possible benefits of CSR disclosure practices to companies. Fombrum et al. (2000), for instance, discover that CSR-related disclosures improve business ability to attract resources, enhance performance and develop competitive advantages while satisfying stakeholders' needs. CSR disclosures also have the ability to determine company's reputation (e.g. Ramdhony and Oogarah-Hanuman, 2012), increase the "licence to operate" and enhance business sustainability (Hamid et al., 2007; Herbohn et al., 2014), and improve financial performance (Janggu et al., 2007; Yusoff et al., 2013). These studies infer the notion that CSR disclosures have much to offer to individual company, next to the entire business industry hence the national economic and social sustainability.

Good CG generally may lead to practice of fairness, transparency, and accountability in managing business organizations. Black et al. (2002) found that strong CG will enhance operating performance through improved efficiency of operations. Previous studies had also focused on the potential links between CG and corporate reporting practice. For instance, De Villiers, Naiker, and van Staden (2011) reveals that companies with larger board size, higher percentage of independent board members, more legal experts in the board, more active CEOs in the board, and a lower dual role of board members as board chairman and are significantly correlated with strong environmental performance. A strand of studies also discover that CG mechanisms are closely linked to greater voluntary disclosures, namely; board characteristics such as board independence and ownership structure (e.g. Norita and Shamsul, 2004; Albawwat and Ali Basah, 2015), board size (Darus et al., 2013; Yusoff et al., 2015), board commitment (Giannarakis, 2014). In view of that, Esa and Mohd

Ghazali (2012) comment on the strong association between CSR disclosure and CG which will result in positive long-term business values, efficient business operations and user acceptance. Michelon and Parbonetti (2012) who studied the potential of CG to influence sustainability disclosures amongst US and European companies had resulted with an affirmative association between community influential and disclosure practice.

Cormier, Lapointe-Antunes and Magnan (2015) learnt that good corporate responsibility relies highly on top management strong leadership. Apart from that, they also discover that CG strategic framework should encompass clear identification of key issues, stakeholders, and spheres of influence establishment of relevant policies and procedures as well as active stakeholder engagement.

Based on the above discussed literature, the followings hypotheses are developed:

H1 **There is a significant positive relationship between board independence and CSR disclosure.**

H1a There is a significant positive relationship between board independence and Marketplace disclosure.

H1b There is a significant positive relationship between board independence and Workplace disclosure.

H1c There is a significant positive relationship between board independence and Community disclosure.

H1d There is a significant positive relationship between board independence and Environment disclosure.

H2 **There is a significant positive relationship between board size and CSR disclosure.**

H2a There is a significant positive relationship between board size and Marketplace disclosure.

H2b There is a significant positive relationship between board size and Workplace disclosure.

H2c There is a significant positive relationship between board size and Community disclosure.

H2d There is a significant positive relationship between board size and Environment disclosure.

H3 **There is a significant positive relationship between board meetings and CSR disclosure.**

H3a There is a significant positive relationship between board meetings and Marketplace disclosure.

H3b There is a significant positive relationship between board meetings and Workplace disclosure.

H3c There is a significant positive relationship between board meetings and Community disclosure.

H3d There is a significant positive relationship between board meetings and Environment disclosure.

H4 **There is a significant positive relationship between board gender and CSR disclosure.**

H4a There is a significant positive relationship between board gender and Marketplace disclosure.

H4b There is a significant positive relationship between board gender and Workplace disclosure.

H4c There is a significant positive relationship between board gender and Community disclosure.

H4d There is a significant positive relationship between board gender and Environment disclosure.

3. Methodology

Content analysis has been carried out on the annual reports of 85 non-financial companies covering a 3-year time frame (2011 to 2013), thus a total observation of 255 company case. The total sampled companies were selected based on the systematic stratified random sampling approach.

A disclosure checklist which consisted of 31 items has been developed based on prior literatures and Bursa CSR framework. The CSR disclosure items in the four primary dimensions have been collected using the disclosure-rating used in Sumiani et al. (2007), and Yusoff and Lehman (2008). The rating of CSR disclosure items are as follows:

general disclosure = scored as '1'
qualitative disclosure = scored as '2'
quantitative disclosure = scored as '3'
combination of qualitative and quantitative disclosure = scored as '4'.

The independent variables used in this study were board independence, board size, board meetings and board gender. The justifications for such a selection of variables are based on these notions:
Board independence: to measure board effectiveness and to determine the board quality as socially responsible or non-responsible firms (Webb, 2004). This variable is measured based on the proportion of non-executive directors to total directors.

Board size: to measure the effectiveness, coordination, communication and decision-making by looking at the board size (Jensen, 1993; Astrachan et al., 2006). Board size is measured based on the number of board of directors in the company.

Board meetings: focused on the board diligence and the level of monitoring on the implementation of the company's activities (Laksamana, 2008; Giannarakis, 2014). Board meeting is measured based on the number of board meetings held a year in a company.

Board gender: male and female directors are deemed to play different roles in company's decision-making, especially on issues relating to CSR management and practice (Giannarakis, 2014). The board gender is measured based on the percentage of director's gender to total directors on board.

These dependent and independent variables of the study are gathered from the sampled companies' annual reports, whilst the control variables, i.e. profitability, company size and sales were collected via Data Stream Thompson. Study analysis was run using the SPSS version 20. Multiple regression models were applied to conform to aim of this study i.e. to examine the effect of CG mechanisms towards CSR disclosure practice. Specifically, the following five models have been identified:

Model 1
$CSRDS = \beta_o + \beta_1 INDs + \beta_2 BodSize + \beta_3 BMeetings + \beta 4 BGender + \beta 5 Size + \beta 7 Lev + \Sigma$
Model 2
$CSRDC = \beta_o + \beta_1 INDs + \beta_2 BodSize + \beta_3 BMeetings + \beta 4 BGender + \beta 5 Size + \beta 7 Lev + \Sigma$
Model 3
$CSRDW = \beta_o + \beta_1 INDs + \beta_2 BodSize + \beta_3 BMeetings + \beta 4 BGender + \beta 5 Size + \beta 7 Lev + \Sigma$
Model 4
$CSRDM = \beta_o + \beta_1 INDs + \beta_2 BodSize + \beta_3 BMeetings + \beta 4 BGender + \beta 5 Size + \beta 7 Lev + \Sigma$
Model 5
$CSRDE = \beta_o + \beta_1 INDs + \beta_2 BodSize + \beta_3 BMeetings + \beta 4 BGender + \beta 5 Size + \beta 7 Lev + \Sigma$

Where:

CSRDS	= Total CSR disclosures
CSRDC	= CSR disclosures on Community dimension
CSRDW	= CSR disclosures on Workplace dimension
CSRDM	= CSR disclosures on Marketplace dimension
CSRDE	= CSR disclosures on Environment dimension
βINDs	= Proportion of INDs to total directors
BodSize	= Number of directors on the board
BMeetings	= Number of board meetings in the year
BGender	= Number of gender on the board
Size	= Total sales
Lev	= Debt Ratio
Σ	= Error term

4. Research Findings

It has been found that there is a gradual increase in the total scores of CSR disclosures made by the sampled companies, over the three years period of study (refer Figure 1). The increase in disclosure practice is evident for all four CSR dimensions. Nevertheless, 'environmental' dimension showed the least percentage of progression between 2011 and 2013.

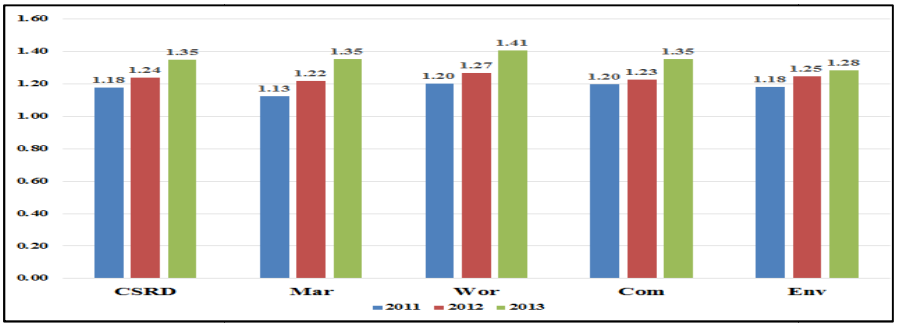

Figure 1 Average Score for CSR Disclosures (2011-2013)

Table 1 provides the average mean scores for all CSR disclosures according to the primary dimensions. Generally, the CSR disclosure reporting for the three years are considered low despite the gradual increased trend, as depicted in Figure 1 above. All CSR items have resulted to fall under the range of 'descriptive' and 'qualitative' form of disclosures (score between 1 and 2). Among the four dimensions, workplace-related disclosures ranked first, with a total mean score of 1.33; followed by Community, Environmental and Marketplace disclosures.

Table 1 Average Mean Scores for CSR Items According to Dimensions

Marketplace	
Produce, use, and develop green products	1.00
Promote good CG practice	1.00
Engage in business of good faith, conduct with sustainable practices	1.00
Promote awareness to uphold market integrity	1.00
Investor protections by lean asymmetry information with good relation	1.33
Engage with multiple stakeholders	1.00
Ethical Procurement by compliance to guidelines	1.00
Supplier management to address business integrity	1.33
Vendor management to address business integrity	1.50
Social branding to foster trust and loyalty amongst stakeholders	1.25
Avg. Mean	1.14
Workplace	
Empower open communication by supporting employees involvement	1.00
Workplace diversity to promote better working environment	1.00
Address issues of gender, bias, and protection of the minorities	1.00
Support labour rights and human rights	1.00
Practice safety and health code of conduct in production	1.33
Provide a quality life for employees at workplace	2.00
Human capital development, training, and sponsorship	2.00
Avg. Mean	1.33
Community	
Employee support and volunteerism in philanthropy activities	1.02
Moral support to the underprivileged, unfortunate and the needy	1.00
Promote and embark on healthy life-style programs for youth	1.00
Impart internship and training program for future employees	1.00
Provide opportunity to fresh graduate and develop unskilled employees	1.27
Award scholarship or sponsorship for higher learning	1.00

Children development, protection and sharpen up their talent		2.00
	Avg. Mean	1.18
Environment		Mean
Relevant anticipation in addressing issue of climate change		1.00
Significant activities to promote carbon reduction		1.00
Allocation for renewable energy exploration		1.00
Energy efficiency and support usage of least conventional fuel		1.00
Waste management or sustainable natural resources		1.05
Awareness and development program for biodiversity protection		1.00
Protection and rehabilitation program for endangered wildlife		2.00
	Avg. Mean	1.15

Overall, the study variables have been found to be normally distributed, and that there was no evidence of multicollinearity problem. Hence the data used in this study were suitable for further analysis.

Table 2 presents the results of the regression analyses performed. All five models have been found to be significant (i.e. F. Change was significant at the .001 level). The Adjusted R-Squares for all five models are .483, .280, .274, .083, .360; which explain the variation in CSR disclosure practice based on the primary dimensions and have been influenced by all CG proxies. Generally, these results indicate the significant influence of board-related decision-making mechanism on the companies' CSR disclosure practices.

Table 2 Regression Analyses: CSR Disclosures and CG Mechanisms

	CSRD Score	Marketplace	Workplace	Community	Environment
	Beta	Beta	Beta	Beta	Beta
	(t–Stat)	(t–Stat)	(t–Stat)	(t–Stat)	(t–Stat)

p< .05*, .01**, .001***

Table 2 also shows that *Board independence* has been discovered to highly influence greater CSR disclosure practice, and in particular, significance influence on the Community-based information (see also, Jo and Harjoto, 2011). With regards to the *Board size*, the first model showed a significant positive relationship of this variable with CSR disclosures. Specifically, this variable has positive significant correlation with the Workplace and Environmental-based information. Such a finding signifies the extent of companies' efforts to fulfill stakeholders' demands for CSR information. Esa and Mohd Ghazali (2012) comment that the existence of wider board expertise and knowledge may

create unanimous decision-making and effective communication among the directors; in which, it represents one of the effective ways to mitigate the agency conflict.

Board meeting has been found to have a positive significant influence only on the Marketplace dimension, whereas the Environmental dimension is seen to have an insignificant and negative relationship. CSR-Marketplace information is closely related to company's internal policies, thus justify the need for higher number of discussions amongst the board members (see Giannarakis, 2014). With respect to *Board gender*, both male and female board members are found to have insignificant influence on CSR disclosures. This finding contradicts the study by De Cabo, Gimeno and Escot (2011) and Francoeur et al. (2008) which argue that women directors are able to provide new skills and abilities to the board, hence facilitate the decision-making process. These findings further conclude that the accepted results for the study hypotheses are related to H1, H1c, H2, H2b, H2d and H3a.

5. Conclusion

Overall**,** despite a slight progression, the CSR disclosure practices for the three years of study have been found to be rather low and 'simplistic'. The research findings also offer some knowledge that pertains to the extent of link between the selected CG mechanisms and CSR disclosure information according to four primary dimensions, and the relevancy of Stakeholder and Agency theories. Specifically, positive significant results have been found for the relationships relating to board independence-community, board size-workplace and environment, and board meetings-marketplace. These findings put forward some preliminary ideas about the CG-related strategies towards enhancing the quality of CSR disclosures thus imply the potentials of CG mechanisms in promoting greater implementation amongst companies in Malaysia.
Two recommendations may be applicable for future research. First, an extended research may be carried out using the samples of award winning companies; based on the justification to investigate the most disclosed information according to the CSR dimensions. Second, other influencing factors for CSR disclosures may be tested against the disclosures in the dimensions. Such a study may further offer ideas pertaining to the business strategies towards greater local CSR disclosure practice.

Acknowledgment

The researchers would like to thank ARI HiCOE and Ministry of Higher Education Malaysia (MOHE) for the research grant received.

Abstract

Malaysia National Green Technology Policy accentuates improvement in the area of energy, building, water and waste management and transportation. However moving to Renewable Energy (energy), Low Carbon Model Town (building) and purchasing Electric Vehicle (transportation) are behavior related to sustainable energy consumption that typically infrequently happens in an individual's life. Discovering the actual and potential customer is more difficult if there is constant fluctuation. Therefore, we focused on development of trends that enable predictions of the future use of these new green-tech product. We focus on personal values to characterize consumers because it has been shown that they impact purchase decisions. Personal values assessed with Schwartz's Portrait Value Questionnaire (PVQ) mediated with three stable groups: 1. LOHAS (those pursuing a Lifestyle of Health and Sustainability), 2. Traditionalists and 3. Career oriented. By referring to Mohr's 5 (five) diffusion of innovation model: the tendency of adopters who are likely purchasing those high tech green product are assessed to forecast the feasibility. Negative path to Technology Enthusiast and Visionaries denote no market. However if these two niches are found, it will become the focal point for segmenting the market. The relationship among constructs is assessed with Structural Equation Modelling on 178 Malaysian samples.

Keywords: Schwartz's Portrait Value Questionnaire (PVQ), segmentation, technology enthusiast, Structural Equation Model (SEM).

Introduction

The government's vision of turning Malaysia into a humane industrialized country by the year 2020 will have a great impact on the usage of energy in the country. To speed up the process, in April 2009, Ministry of Energy Green Technology and Water was established that later on created the National Green Technology Policy (NGTP) serving as national guidelines to improve the four (4) key sectors of *energy*, *buildings*, water *& waste water management* and *transportation*. Furthermore, the current Economic Transformation Program has put sustainability as one of the three goals of the economic transformation program and aspires to place Malaysia as a green hub all the way along the business development continuum – from research to design to manufacturing to commercialization. However, Renewable Energy, Low Carbon Model Town and Electric Vehicle in Malaysia are a kind of radically new hightech product requiring to be introduced in the niche market (Levinthal, 1998; Ortt et al., 2008; Sood & Tellis, 2005; Suprapto, 2010). Slatter and Mohr (2006) based on the work of Moore (1995) provides a unique insight that the marketing strategy should focus on the niche that consists of 'visionaries' and 'innovators' as the early adopters of the new high-tech products, yet not much explanation can be found on how to identify and select the potential niches within the market that is nonexistent.

Although Malaysia is a progressive nation in terms of industrialization, Malaysians are conservative in most business dealings and usually governed by concrete past experience (Koh & Hoi, 2003). As such a new practice such as introducing green electricity, creating low carbon house, marketing electric car may not provide comfort for decision-makers to commit themselves to until it is proven acceptable. This notion is confirmed with the recent findings from Ghodrati et.al (2012) that green

housing market still is not attractive for majority of home buyers. Higher price compared with conventional homes is one of the main causes of the current situation in the green home market.

This paper is aiming at profiling the prospective buyers by establishing the values that are important to people to forecast their attitudes and behavior as values are argued to be a more effective to profile consumers and to segment markets (De Pelsmacker et al., 2005; Doran,2009; Mueller et al., 2011).

Values in Segmenting Green Consumers

The work of Ottman (1993) provides valuable insights into the demographic characteristics of green consumers: educated, affluent and under 55 years of age which are consistently true when examined in the USA (Wiser, 2007; and Zarnikau, 2003), Canada (Rowlands et al., 2003), Germany (Gossling et al., 2005; Muller, et.al., 2011), the Netherlands (Arkesteijn and Oerlemans, 2005), and the UK (Diaz & Ashton, 2011). However, if this segmentation is applicable within Malaysian setting further investigation is necessary as marketing based on demographic consumer characteristics is ineffective (Doran, 2009). Diamantopoulos et.al (2003) concluded that demographics alone are not very significant in defining the socially responsible consumer because ethical concern and awareness have become widespread.

In Malaysia setting, the current research on green marketing is mostly approached by classic Ajzen's Theory ofPlanned Behavior (Wahid et.al, 2011; Phuah et.al, 2011, Moorthy et.al, 2012, Nizam et.al, 2014). Therefore, little is known as to what motivates Malaysian consumers to buy green high - tech products.

Theorists (Rohan, 2000, Young et.al, 2010) and marketers (Lowe and Corkindale, 1998) believe that values cause behavior of consumers and keeping up with societal changes concerning values is an imperative for marketers (Kahle et al., 1988). As such, currently many scholars (e.g., Doran, 2009; Kim, 2011) have attempted to find particular types of values that are considered to influence pro-environmental beliefs and behaviors. The values theory developed by Schwartz and Bardi, (2001) have been dominant in the values domain for much of the last two decades (Parks & Guay, 2012) making it is employed as the basis for this values-related study. Schwartz's theory is based upon 57 single values, which can be abstracted into 10 value types encompassing similar motivations and organizes the value types in two basic bipolar dimensions: *self-transcendence* and *self enhancement values.*

Environmentally favorable attitudes and behaviors are driven more strongly by collective or/and self-transcending goals than individual or/and self-enhancing concerns (Follows and Jobber 2000; Kim 2006; Kim and Choi 2005, Kim, 2011). The self-transcendence values are *universalism, benevolence, security, conformity and tradition* while self-enhancement values are self-direction, stimulation, hedonism, achievement and power. Consequently, self-transcendence values are used to explain why people engage in pro-environmental actions and to predict potential buyer of green product described in the following theoretical framework.

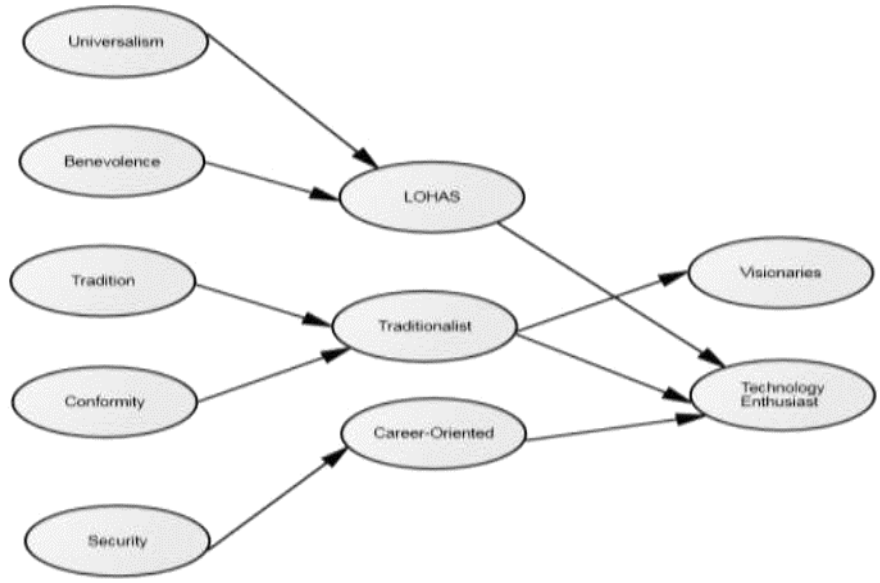

Fig 1. Theoretical Framework

Doran (2009) found out that universalism values have the strongest influence on the decision to consume fair trade products. Therefore, the hypothesis in this study is:

Hypothesis 1: *Market segment with universalism value prefers to be Lifestyle of Health and Sustainability leading to technology enthusiast- minded toward purchasing green high tech product.*

Benevolence prefers to preserve and enhance of the welfare of people with whom one is in frequent personal contact and Shaw et al. (2005) found that the values helpful and honest to be related to ethical consumption leading to the second hypothesis.

Hypothesis 2: *Market segment with benevolence value prefers to be Lifestyle of Health and Sustainability leading to technology enthusiast-minded toward purchasing green high tech product.*

The importance attached to conformity values could be attributed to the fact that participants may feel that in order to promote the smooth functioning of purchasing high green tech product which involves social interaction on a regular basis, they must emphasize self-restraint from socially disruptive behavior (Shaw et al. 2005).This implies that the person will wait and see and watch what most people prefer.

Hypothesis 4: *Market segment with conformity value prefers to be traditionalist leading to visionaries- minded* toward *purchasing green high tech product.*

In collectivist culture including Malaysia, the environmental concerns and green purchase behaviors are a hierarchical model of value-attitude-behavior that has served as the conceptual framework for predicting a wide range of behaviors (Follows and Jobber 2000; Homer and Kahle 1988; McCarty and Shrum 1994), yet, the strengths of the attitude behavior relationship have been controversial (e.g., a weaker relationship than expected). Thus the fifth hypothesis is:

Hypothesis 5: *Market segment with tradition value prefers to be traditionalist leading to visionaries-minded toward purchasing green high tech product.*

Methodology and Sampling

In line with demographic characteristics of green consumers: educated, affluent and under 55 years of age, theresearch questions are operationalized in a questionnaire adapted from Schwartz (2012) on measuring self-transcendence value. This way, the writer applies purposive sampling technique as it is the most effective when one needs to study a certain cultural domain (Tongco, 2007). Purposive sampling has been used through the years including comparisons of cultural practices (Neupane et al, 2002). The survey is targeted to obtain 200 respondents. Participants are asked to rate on a seven-point scale the importance of each value as a guiding principle to them when they are offered high tech green product under government policy at the moment. To investigate consumers' awareness on LOHAS concepts, the questions are designed according to the LOHAS principles (MY LOHAS Editors, 2008). The highest score indicates those pursuing a Lifestyle of Health and Sustainability, medium indicates Traditionalists and lowest indicates Career-oriented groups. Questionnaires to segments the innovation adapters: Technology Enthusiast, and Visionaries, are developed from the work of Slater & Mohr (2010). Path Analysis is used to determine the relationship among Lifestyle of Health and Sustainability (LOHAS), Traditionalists and Career-Oriented with Technology Enthusiast, and Visionaries. When no particular problem is observed in the measurement model, the path analysis is then employed to analyze the overall fit of the proposed model and to estimate all the relevant path coefficients. Finally theory trimming is performed by eliminating path with insignificant coefficients, and this becomes the model for segmenting green-tech product consumers in Malaysia. After validated, 178 data is ready for processing.

Measurement

All instruments incorporated in the questionnaire were based on the previous literature analysis. Universalism as endogenous construct is measured with 8 (eight) dimensions: equality (x11), a world at peace (x12 unity with nature (x13), wisdom (x14),), a world of beauty (x15), social justice (x16), broadminded (x17), and protecting the environment (x18). Benevolence as endogenous construct is measured with 5 (five) dimensions: for loyal(x21), honest (x22), helpful (x23), responsible (x24), and forgiving (x25). Security as endogenous construct is measured with seven (7) dimensions: family security (x31), national security (x32), social order (x33), cleanness (x34), reciprocation of favors (x35), sense of belonging (x36), and healthy (x37). Conformity defined as restraint of actions, inclinations, and impulses likely to upset or harm others and violate social expectations or norms is measured with self-discipline (x41), politeness(x42), honoring parents and elders (x43) and obedience (x44). Another endogenous construct: tradition defined as respecting commitment, and acceptance of the customs and ideas that traditional culture or religion provide is measured with four dimensions: devout (x51), respect for tradition (x52), humble (x53) and moderate (x54).

Exogenous variables of Lifestyle of Health and Sustainability (LOHAS), Traditionalists and Career-Oriented are investigated through agreement of their values on the following 4 (four) dimensions: holistic health (y11), conservation (y12), global social justice (y13), personal growth (y14), and sustainable living (Pesek et al., 2006).Questionnaires to segments the innovation adapters: Technology Enthusiast and Visionaries are developed from the work of Blackburn (2011) where visionaries are denoted as sensitive to group norms and values (y41) having more of a local perspective (y42), likely to be opinion leaders (y43) adopting through Technology Enthusiast' endorsements (y44) and cost-conscious (y45). Technology Enthusiast is reflected as those who are better educated (y51), cosmopolitan outlook (y52), high involvement outside their own communities (y53) depending less on group norms (y54) and having greater self-confidence (y55).

Results

Measurement Model

Table 1 shows that the factors loading extracted all surpassed 0.50 indicating that the instrument had acceptable convergent validity. Structural equation modelling usually presents debates on model evaluation as no model can actually meet all the required criteria (Schumacker and Lomax, 2004). For example, SEM requires small value for Chi-square statistic ($\chi 2$) and probability (P) smaller than 0.05. However, though these statistics are usually reported in structural equation modelling results, they are seldom accounted for and mostly ignored by referring to other alternative ways of assessing model fit (Robins, Fraley and Krueger, 2009). Hu and Bentler (1999) argue that threshold values approaching to 0.95 for Tucker Lewis Index (TLI), 0.90 for Norm Fit Index (NFI), 0.90 for Incremental Fit Index (IFI), 0.06 for Root Mean Square Error of Approximation (RMSEA) may sufficiently support the conclusion of a reasonably good fit between the proposed model and the data. Other scholars proposed other goodness-of-fit statistics consisting of CMIN/DF (The Minimum Sample Discrepancy Function) supposed . 2, 0 (Arbuckle, 2005); GFI (Goodness-of-Fit Index) approximating 0.90 and AGFI (Adjusted Goodness-of-Fit Index) approaching to 0, 90 or higher (Hair et al, 2006).

By referring to $\chi 2$ test ($\chi 2$ = 1318.669) and probability (P = 0.01), this model cannot capture goodness-of-fit of the model, perhaps due to the model which is complicated and the smallness of sample size. However when observed from other measurement, the model indicates an acceptable fitness: CMIN/DF = 1.137 (expected smaller than 2), GFI = 0.778 (marginal fit), AGFI = 0.767 (marginal fit), CFI = 0.972 (higher than 0.95), TLI = 0.971 (higher than 0.95), NFI: 0.881 (close to 0.90), IFI = 0.973 (above 0.90).

The full model of the research after model specification to meet SEM requirement is observable on the Figure 2.

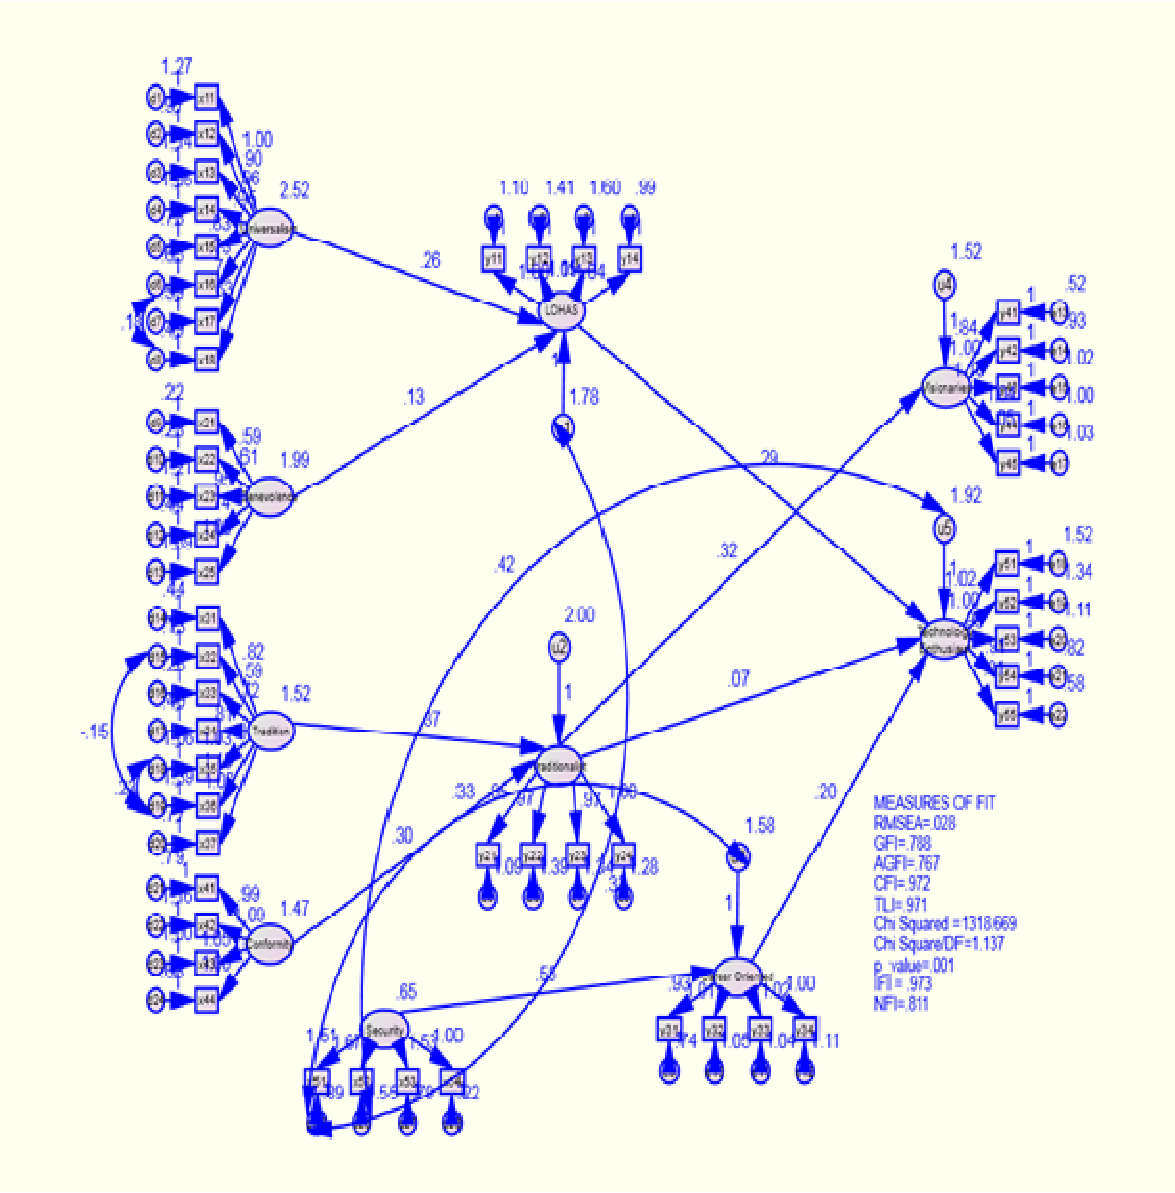

Fig. 2: Full model describing relationship among construct

Structural Model

The proposed structural model has been examined through the significance of the path coefficients (standardized β) and by observing the probability values of the dependent (endogenous) variables. Hypothesis testing to measure direct effect is observed through regression weights for each exogenous construct to its endogenous construct. Since the model applies intervening variable, the indirect effect is inferred from the condition that if direct effect from independent variable to intervening variable is significant and direct effect intervening variable to dependent variable is also significant, thus, the indirect effect is concluded significant. In the other hand, if one of direct effect or both are insignificant, then, the indirect effect is inferred as insignificant. The result for structural model analysis is observable on Table 2.

Table 2: Structural Model Result Among Constructs

			Estimate	S.E.	C.R.	P	Conclusion
LOHAS	<---	Universalism	.265	.071	3.711	***	Significant
LOHAS	<---	Benevolence	.125	.079	1.589	.112	Not
Traditionalist	<---	Tradition	.371	.100	3.705	***	Significant
Traditionalist	<---	Conformity	.301	.104	2.894	.004	Significant
Career Oriented	<---	Security	.551	.143	3.846	***	Significant
Technology_Enthusiast	<---	LOHAS	.285	.085	3.348	***	Significant
Technology_Enthusiast	<---	Career Oriented	.197	.089	2.230	.026	Significant
Technology_Enthusiast	<---	Traditionalist	.074	.076	.971	.332	Not
Visionaries	<---	Traditionalist	.321	.073	4.384	***	Significant

Notes: *** = p < 0.00

Table 2 indicates that the result of direct effect of path coefficient between universalism and LOHAS is 0.265 with p-value < 0.00 and LOHAS to technology enthusiast is 0.285 with p-value < 0,001 indicating that both path coefficient have significant effect. This indicates the acceptance of hypothesis 1 that market segment with universalism value prefers to be Lifestyle of Health and Sustainability (LOHAS) leading to technology enthusiast- minded toward purchasing green high tech product with indirect effect as much of 0.265 x 0.285 = 0.075. In the other hand, the result of direct effect of path coefficient between benevolence and LOHAS is 0.125 with p-value > 0.00 leading to the rejection of hypothesis 2. This way market segment with benevolence values will not become LOHAS and will not become technology enthusiast either. Further analysis shows that direct effect of path coefficient between security and career-oriented is 0.551 with p-value < 0.00 and career-oriented to technology enthusiast is 0.197 with p-value < 0.05 indicating that both path coefficient have significant effect concluding to the acceptance of hypothesis 3 that market segment with security value prefers to be career-oriented leading to technology enthusiast-minded toward purchasing green high tech product with indirect effect as much of 0.551 x 0.197 = 0.108. Similarly, direct effect of path coefficient between conformity and traditionalist is 0.301 with p-value < 0.05 and traditionalist to visionaries is 0.321 with p-value < 0.00 indicating that both path coefficient have significant effect concluding to the acceptance of hypothesis 4 that market segment with conformity value prefers to be traditionalist leading to visionaries- minded toward purchasing green high tech product with indirect effect as much of 0.321 x 0.197 = 0.063. Finally, direct effect of path coefficient between tradition and traditionalist is 0.371 with p-value < 0.00 and traditionalist to visionaries is 0.321 with p-value < 0.00 indicating that both path coefficient have significant effect concluding to the acceptance of hypothesis 5 that market segment with tradition value prefers to be traditionalist leading to visionaries- minded toward purchasing green high tech product with indirect effect as much of 0.321 x 0.371 =0.119.

This research is focused on development to discover trends that enable predictions of the future by particular reference on personal values to characterize consumers. Prediction is based on the positive path by calculating the value of total effect which is the sum together of the direct effect and the total indirect effects (Shipley, 2008). The model: *Universalism*-----> *LOHAS*----- > *Technology Enthusiast* generates the direct effect of *Universalism* to *LOHAS* = 0.265, and the indirect effect of *LOHAS* to *Technology Enthusiast* is 0.285 . This brings the total effect of 0.265 + 0.285 = 0.55 indicating that 55 % of technology enthusiast reflected in tendency to purchase high green tech is predicted by universalism values with the condition that the consumers hold the belief in Lifestyle of Health and Sustainability (LOHAS). Similarly, the model: *Security* -----> *Career-oriented* ---- > *Technology Enthusiast* generates the direct effect of *Security* -----> *Career-oriented* = 0.551, and the indirect effect of *Career-oriented to Technology Enthusiast* is 0.197 carrying the total effect of 0.551 + 0.197 = 0.748 indicating that 75 % of technology enthusiast reflected in tendency to purchase high green tech is predicted by security values with the condition that the consumers accept the customs and ideas that traditional culture or religion provide. Thus, these two models can be used to predict those who belong to Technology Enthusiast. In the other hand, the model *Conformity* ---- > *Traditionalist* ---- > *Visionaries*

produces the direct effect of *Conformity* ---- > *Traditionalist* = 0.301 and the indirect effect of *Traditionalist to Visionaries* = 0.321 resulting in the total effect of 0.301 + 0.321 = 0.622 indicating that 62 % early adapters of prospective purchasers of green high tech product are those who are restraint of actions, inclinations, and impulses likely to upset or harm others and violate social expectations or norms. By the same token, the model *Tradition* ---- > *Traditionalist* ---- > Visionaries produces the direct effect of *Tradition* ---- > *Traditionalist* = 0.371 and the indirect effect of Traditionalist to Visionaries = 0.321 resulting in the total effect of 0.371 + 0.321 = 0.692 indicating that 69 % early adapters of prospective purchasers of green high tech product are those who are respecting commitment and accepting the customs and ideas that traditional culture or religion provide. Since this study argued that Malaysian markets for renewable energy, low carbon model town and electric vehicle in harnessing Malaysian economic transformation model are going to develop beyond the Technology Enthusiast or Visionaries stages of diffusion, the paths recommended are *Security* -----> *Career-oriented* ---- > Technology Enthusiast *and Tradition* ---- > *Traditionalist* ---- > *Visionaries* as each path generates the highest total effect of 75 % and 69 % respectively.

Discussion

The research has proved the existence of Technology Enthusiast and Visionaries - the group interested in sustainable energy solutions- to become the starting point for segmenting the market as well as pioneering agent to disseminate the importance and urgency of shifting from using conventional products into the green high-tech product for the purpose of national sustainability in preserving natural resources. This finding is in line with Slatter and Mohr (2006) providing a unique insight that the marketing strategy should emphasize on the niche that comprises of 'visionaries' and 'technology enthusiast' as the early adopters of the new high-tech products. Since most y new high-tech product was presented in the niche market rather than the mass-market (Levinthal, 1998; Ortt et al., 2008; Sood & Tellis, 2005; Suprapto, 2010), this study explores on how to identify and select the potential niches within the market in setting of a developing country Malaysia to support sustainability concept echoed in Economic Transformation Program as yet not much enlightenment can be originated on how to classify and select the prospective niches within the market that is nonexistent primarily in situation where high green tech product is still in an early infant phase. This study has found out which values are salient to Malaysian when wishing to adopt green high - tech products which is then used as a base for segmentation. This research has found out security and tradition as values that are of paramount importance to people to segment the market for high tech green product supporting the notions that values are more effective to profile consumers and to segment markets (De Pelsmacker et al., 2005; Doran, 2009; Mueller et al., 2011).

The findings will have certain practical implications for marketing and public policy. The implications are mainly related to segmentation and targeting efforts and in particular to what types of messages are constructed to persuade people to buy green. In terms of segmentation, the results of this study suggest that target segments for green high tech products may be those who are motivated strongly by self-transcending goals. Likewise, advertising and other marketing communication efforts need to portray the use of green products as a way which can contribute to the well-being of all. Because the path to green purchase behavior can vary as a function of personal values, the appeals of persuasive communication should also vary according to the values of the target. Communications aimed at promoting people's environmental attitudes and buying habits may try to match the focus of the expected benefits to the predominant values of the *security* whose motivational goal is safety, harmony, and stability of society, of relationships, and of self and tradition whose motivational goal emphasizes respect, commitment, and acceptance of the customs and ideas of one's culture or religion. These niches are 'visionaries' and 'innovators' of the early adopters of the new high-tech products in Malaysian setting. This way the policy maker does not consider all Malaysian people are the target market of the green high tech product as segmenting philosophy is "select your market creatively!"

Conclusion

Since Malaysian government encourages switching to Renewable Energy and Low Carbon Model Town and Electric Vehicle as one of Economic Transformation Program agendas, framework to pinpoint groups with a high potential to become new customers is extremely important. By particular reference to Slatter and Mohr' unique insight that the marketing strategy should focus on the niche that consists of 'visionaries' and 'innovators' as the early adopters of the new high-tech products, this study provides the way how to identify and select the potential niches within the market in setting of a developing country Malaysia which is collectivist in nature. This way, Schwartz's self-transcendence values represent collective interests and serve as guiding principles when making a purchase decision for green high tech products. The extent of consumers' environmental efforts will likely depend on their value orientations.

This research had some limitations that had to be considered. First, this research used a cross-sectional data not a longitudinal sample which was collected over several points of time to support the findings. Second, only links between limited numbers of constructs were examined. Therefore, future research should examine additional variables that were likely to influence the explored relationships. Finally, the obtained results did not imply definitive conclusion about the analyzed relationships and might have limited generalizability due to the industries and geographical specificity of researched sample. Future studies should be expanded to wider geographical territories so that the findings will be generalizable for developing country of Malaysia.

Abstract

The system of NBICS-technologies is interpreted as the result of the coherence of different processes: the convergence of research in all scientific fields, the cognitive management realization and the transformation of education contents. A culture reaction expresses itself in the phenomenon of bioethics, which is a transdisciplinary science, humanitarian expertise of innovations in the role of compulsory procedure of cognitive management and a new academic discipline at the same time. The "semiotic attractor" model helps to define the stages of mutual proliferations of NBICS-technologies symbolism and bioethics symbolism. It is proposed to read these stages as invariants in the development of innovation strategies and in the impact estimation for education and cognitive management in the NBICS-technologies field.

Keywords: Management of coherent processes, NBICS-technologies, semiotic attractor, bioethics symbolism.

Introduction

Pace of different science convergence is illustrated by speed with which correspondent acronym gets longer: first NBIC (Roco & Bainbridge 2003) included the first letter of "Social science" (Kovalchuk 2011), and now "and beyond" (NRC 2014) was added. Diagnosis "a science and technology revolution is occurring" (NRC 2014, p. 13) states incompleteness of convergence, and more than that, states its initial phase. But it's already clear that NBICS-technologies as a product of convergence turned into self-organizing system.

Obligatory conditions of a self-organization initial phase include coherent behavior of all parts of the system and forming of spectrum of attractors as objective goals of the system. These conditions define the problem – management of coherent processes and management of attractors' configuration. Coherence is uniformity of synchronized actions, but the strict co-ordination of behavior does not mean co-ordination of tendencies to such behavior and goals of such behavior. Complexity of problem solution caused by absence of means of fundamental natural science for exact measuring all spectrum of attractors as objective goals of self-organizing systems' dynamics. In the humanities there are approaches to research social tendencies by diagnostics of on-going changes of symbols.

"Revolutions in symbolism" as a summary of "the final of wisdom" of any management (Whithehead 1927, p.61) retrospectively mark phases of socio-cultural dynamics, and yet they can point to its "semiotic attractors" because translation of such images and concepts as "today", "the day after tomorrow", "distant future" targeted at those "semiotic attractors". We used the model of "semiotic attractor" to understand the mechanism of how aims of innovations' management compete (Melik-Gaykazyan, Evdokimov & Melik-Gaykazyan 2015). Aim of given article is to apply this model to semiotic diagnostics of coherent processes' management. Foundations of the model are: 1) kinetic equation of competition between three types of information (Chernavski 1990); 2) approved method of

numeral solving the equation (Evdokimov & Melik-Gaykazyan 2013); 3) structure of process-occasion described by A.N. Whitehead. In this structure there are three consecutive phases: “the responsive phase”, “the supplemental stage” and “the satisfaction” (Whithehead 1929, p. 323), so while modeling coherent processes we will accentuate these three states formed by carriers of aims for “today” (element 1), “the day after tomorrow” (element 2) and “distant future” (element 3). It is relevant to tasks of cognitive management aimed at creation of “scientific product”, its implementation, prediction of innovations' after-effects, as well as goals of subjects managed: short-term goals of technologies' developers, predicted goals of education structures, asymptotic goals of the science.

Model of information dynamics system

In this section we introduce a model to describe dynamics of number density of elements n_i. Here subscript i corresponds to certain element carrying i-th type of information, and number densities are functions of phase coordinates and time. The model is based on generalized Lotka-Volterra model and the following processes are considered: 1) competition of j-th element and i-th element with rate $\left(-b_{ij} n_i n_j\right)$, where b_{ij} is competition coefficient; 2) self-competition with rate $\left(-a_i n_i^2\right)$, where a_i is corresponding coefficient; 3) autocatalytic reproduction with rate n_i/τ_i, where τ_i is characteristic time of self-reproduction; 4) element number distribution in phase space due to diffusion with rate $\nabla\left(D_i \nabla n_i\right)$, where D_i is diffusion coefficient for i-th element. Phase space coordinates and time are dimensionless.

The model is realized in the following system of equations:

$$\frac{\partial n_i}{\partial t} = \nabla\left(D_i \nabla n_i\right) + \frac{n_i}{\tau_i} - a_i n_i^2 - \sum_{i \neq j} b_{ij} n_i n_j, \quad i, j = \overline{1,k}; \tag{1}$$

$$n_i\left(t=0, \mathbf{r}\right) = \sum_{j=1}^{m} \alpha_j \, e^{-\beta_j \left(\mathbf{r}-\mathbf{r}_j\right)^2}, \quad i = \overline{1,k}; \tag{2}$$

$$n_i\big|_{\partial V} = 0, \quad i = \overline{1,k}; \tag{3}$$

where k is maximum number of elements. Here equation (2) describes initial distribution of elements. In this work we choose random distribution of m Gauss-shaped peaks in phase space, where α_j, β_j are peak parameters, and $\mathbf{r}_j$ is random vector in phase space. Equation (3) describes zero number density boundary conditions, where V is a phase space volume under investigation, and ∂V is the boundary of this volume. Element number density dynamics is visualized by the following algorithm: each element has its corresponding color and if i-th element dominates in some position of phase space, the i-th color is assigned to that position.

In this work we consider the three-element model with two spatial variables and one time variable. The system (1-3) was solved numerically using Wolfram Mathematica. Fig. 1, Fig. 2 and Fig. 3 represent the results of calculations with the following parameter values: $D_1 = D_2 = D_3 = 0.05$; $\tau_1 = 1.1$; $\tau_2 = 1.15$; $\tau_3 = 1$; $a_1 = a_2 = a_3 = 0.1$; $b_{12} = b_{13} = b_{21} = b_{23} = b_{31} = b_{32} = 5$.

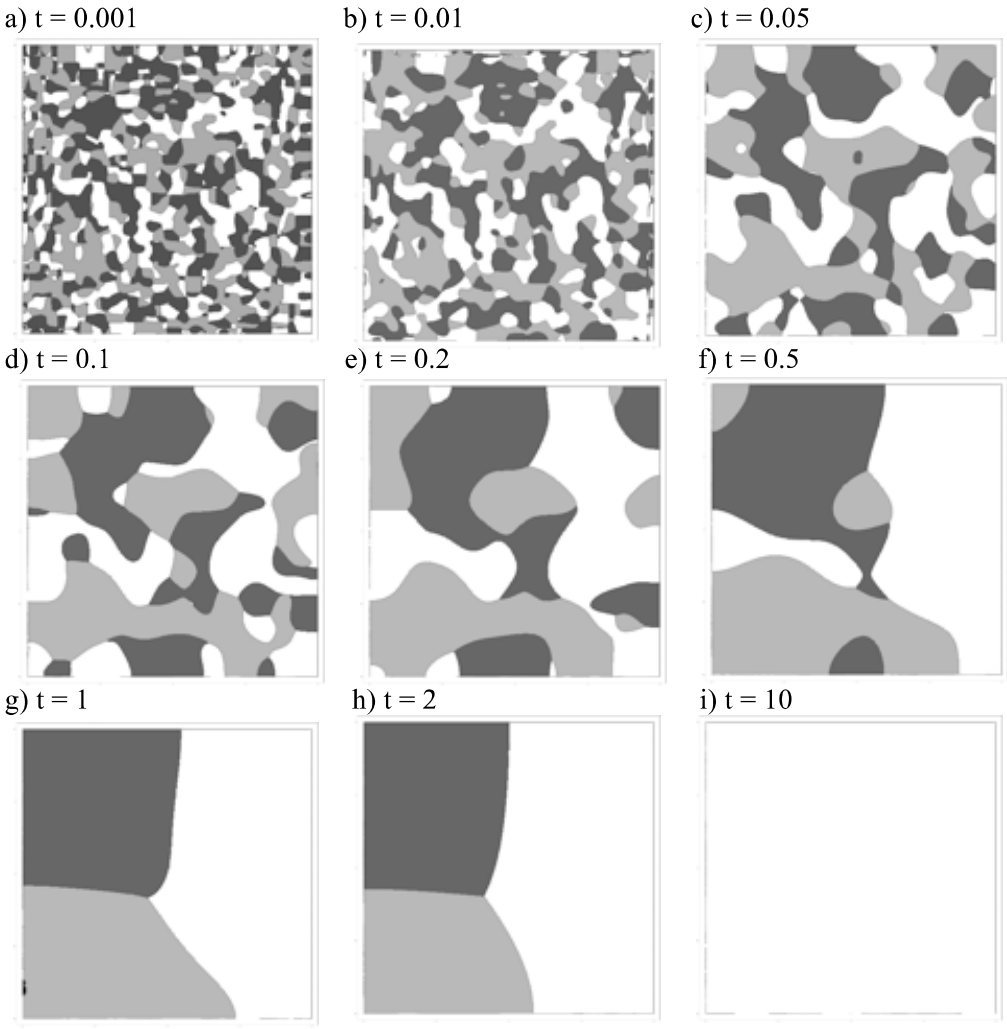

Fig.1 Distribution of element domination over phase space and time. Charts a)-i) correspond to different moments of time. Abscissa and ordinate correspond to spatial variables. Dark gray color corresponds to the element 1, light gray to the element 2 and white to the element 3.

The analysis of results shows that considered system pass through the following stages: “the responsive phase”, when all phase space is covered by a “mosaic” of small pure clusters of certain elements (Fig. 1b); “the supplemental stage”, when cluster boundary curvature and the number of clusters decreases (Fig. 1h); “the satisfaction” – the pure cluster stage, when one element dominates over all phase space (Fig. 1i). Parameter values, initial and boundary conditions may influence on dynamics only quantitatively, and general sequence does not change.

It should be pointed out that at the “mosaic” stage it is impossible to predict what element will dominate if system parameters are unknown. We illustrate this thesis by results of calculations with the same initial condition as presented at Fig. 1 and with different parameter values (Fig. 2, 3).

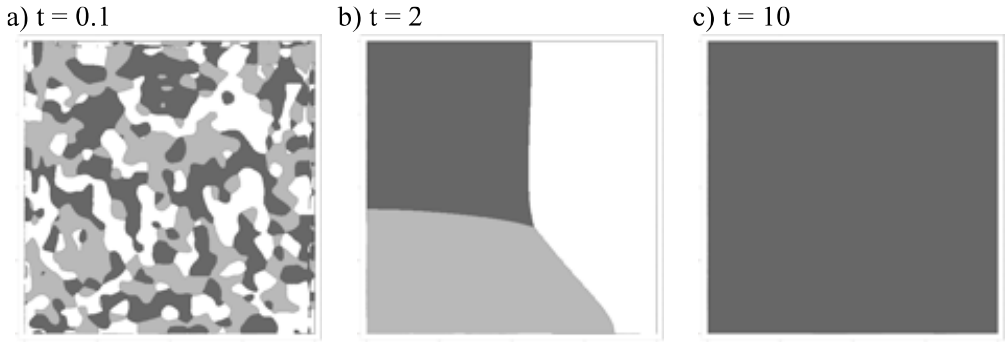

Fig.2 Time and space dynamics of element distribution leading to domination of the element 1 (dark gray). Stages: a) “the responsive phase”, b) “the supplemental stage”, c) “the satisfaction”.

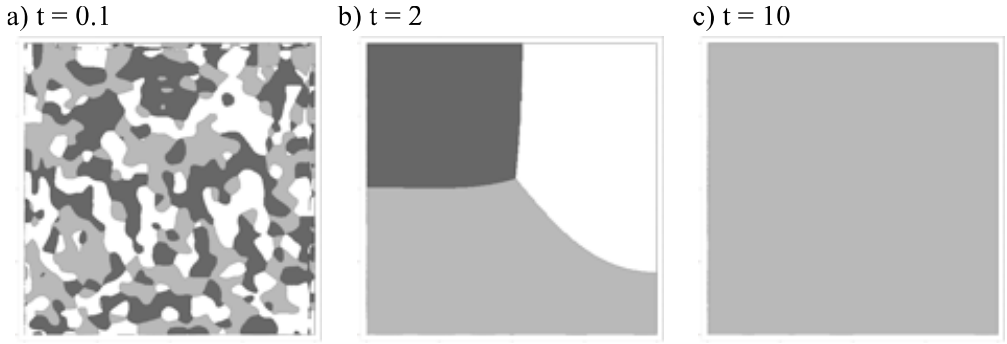

Fig.3 Time and space dynamics of element distribution leading to domination of the element 2 (light gray). Stages: a) “the responsive phase”, b) “the supplemental stage”, c) “the satisfaction”.

It should be noted that at the final stage three different elements dominate (Fig. 1i, Fig. 2c, Fig. 3c) despite the fact that at the “mosaic” stage the distribution of elements is virtually the same (Fig. 1b, Fig. 2b, Fig. 3b).

Semiotic diagnostics of NBICS-technologies dynamics’ trajectory

Illustrations (Fig. 1-3) make specific the content of A.N. Whitehead's abstract descriptions. His “responsive phase” is “pure reception of the actual world in its guise of objective datum” (Whithehead 1929, p. 323), “reception of the actual world as a multiplicity of private centers of feeling, implicated in a nexus of mutual presupposition” (Whithehead 1929, p. 323).

Here every new state of instability or some challenge should be receipted and “responded”. State of instability is common for the whole system but each part of the system looks for “response” to it independently. At the given phase it's impossible to estimate whether found “response” will solve the problem only for “tomorrow” or for “distant future” as well. But in any case all parts of the system have to mutually suppose each other – “implicated in a nexus of mutual presupposition”, i.e. co-operate each other with. Variants of co-ordinated behavior of parts are shown at the model (Fig. 1-3). Substance of the next “supplemental stage” is governed by spectrum of ideals “gradually shaped in the process itself”. “The satisfaction” completes the process. This stage is described by A.N. Whitehead as “marking the evaporation of all indetermination”, it “embodies a determinate attitude of «yes» or «no»” (Whithehead 1929, p. 323), when an actual occasion happens. The given occasion is always spontaneous and its content always brings novelty. These features correspond to the specifics of a “scientific product”

completely. At the same time innovation can become an occasion that irreversibly changes an orbit of the system's dynamics. The model shows (Fig. 1-3), that any innovation can reach “the satisfaction” stage. This result is dramatic because an asymptotic aim is typical for the innovation having only short-term value. Irreversibility of the process is compensated by its speed, so the result of “the satisfaction” may be corrected. But payment for this correction will be 1) an inevitable return to the initial problem situation that is already laden with negative consequences, and 2) losing pace of innovative dynamics that contradicts the destination of cognitive management. This conclusion is extremely actual for the management related to NBICS-technologies. So far as NBICS-technologies make it real to voluntarily manipulate natural forces, human corporeality and human self-perception that results in deformation of spiritual immunity that limits creation and using technologies related to constructing human by human. In other words, for convergent dynamics, i.e. the dynamics aimed at human being the error in selection of goal can become fatal one. But in this situation there is a reason for optimism. Firstly, “the satisfaction” and “the supplemental stage” are divided by more period of time than “the responsive phase” and “the supplemental stage” (Fig. 1-3). Secondly, as stressed by A.N. Whitehead, at “the supplemental stage” the “scalar” form overwhelms the original “vector” form. It means that at “the supplemental stage” all corrections are allowed. Finally, in Introduction we quoted diagnosis for a modern state of convergence – “revolution is occurring” (NRC 2014, p. 13). It indicates that innovations of NBICS-technologies still belong to “the supplemental stage”, and its “scalar” form permits possibilities for external interference.

Bioethics opposes to enthusiasm of NBICS-technologies. Due this opposition bioethics obtained specific features of NBICS-technologies: 1) belonging to many sciences simultaneously (Nicolescu 2008), 2) attention to innovations' expertise and risk assessment (Yudin 2011), 3) solid belonging to biomedical education (Melik-Gaykazyan & Mescheryakova 2015), 4) new understanding (especially for the Russian context) of the purposes of legal regulations for the impact on any living object (Gorbuleva, Melik-Gaykazyan & Melik-Gaykazyan 2016). High economical effectiveness of NBICS-technologies (Roco & Bainbridge 2003; Kovalchuk 2011; NRC 2014) poses a problem for management to accelerate “time to innovation” (NRC 2012, p. 11) while bioethics requires to provide the exact estimate of anthropological consequences after implementation of these innovations. The both sides debate and their arguments have the “scalar” form. Since nobody denies an innovations' “vector” is necessary. Mutual penetration of innovations' symbolism or proliferation corresponds to the same “scalar” form which shows their common slogan – “facilitating the transfer of knowledge, ideas, and technology to society” (NRC 2012, p. 11). It's worth to mention discussion is conducted within framework of University community and so aimed at selection of further strategies of innovative education. It is important because the mathematical equation of the model take into account 2 parameters – auto-catalytic reproduction and diffusion, that correspond generation of definite goal's followers and attraction of competing goal's followers to competing cluster. In NBICS-technologies environment these functions are fulfilled by education. Thus, that is “the supplemental stage” which is a point of application of cognitive management force and the main anxiety while developing innovative strategies of education.

Nowadays (NRC 2014; NRC 2012) a new strategy in development of NBICS-technologies came up for discussion. This strategy is aimed at the development of technologies' “component parts” for their voluntary combining in some future implementations. Given circumstance increases the urgency of NBICS-technologies dynamics' trajectory diagnostics hence bioethical expertise can deliver positive verdict in regard of development of all “component parts” but disagree with absence of anthropological risks while combining those “parts”. Semiotic diagnostics of aims as images of states supposed to reach “today”, “day after tomorrow” or in the “distant future” can be a palliative solution to this problem. For instance such fixations as “in order to achieve our national goals” (NRC 2012, p. 12) or “Global Future 2045” (Tishchenko 2014).

Advantage of the presented model is that it obviously shows a trajectory of appearing all the parts' coherent behavior in the system. This trajectory can be traced (Fig. 1-3) by the way disconnected parts of the system independently and “without any constraint” got in the same cluster. The trajectory unifies

stable stages but their stability does not exclude variable dynamics' scenario that is confirmed by different endings of the modeling process (Fig. 1-3). The model denotes “the supplemental stage” for effective external influence on managed system. This stage has the most susceptibility to management signals and the most duration that gives opportunities for monitoring and correction of transition process to the final stage. Here monitoring and correction will be aimed only at the symbolization of system parts' aims.

Conclusion

Influences of NBICS-technologies initiate variety of reactions in complex-organized socio-cultural space, and each produced variant of development creates its own possible future – its own attractor. Cause of influence is the goal selected (expressly or occasionally) for “production” of the new knowledge. Symbolization of goals embodies or transforms existing conceptions of correlations between actuality and reality, scientific and extra-scientific. Firstly, the model of “semiotic attractor” reveals invariant stages of innovations' development. Secondly, it shows the innovation aimed at short-term goals is able to reach “the satisfaction” stage. It explains position of bioethics as opponent of NBICS-technologies because attention of any humanitarian expertise is concentrated at asymptotic goals of human being existence. Finally, it shows the stage at which it's possible to conduct correct of coherent processes.

Acknowledgment

The results were obtained in the frameworks of the RFBR project №14-06-00440 “Development of ways to use research methods of nonlinear dynamics for the detection of social system self-organization attractors”, the RFBR project № 15-03-00598 “Bioethics: creation of the new symbolism” and the project № 155 “Methodology of the modeling the semiotic mechanisms of management of educational systems nonlinear dynamics” of the State assignment for “Tomsk state pedagogical university”.

Abstract

The paper addresses the methodological issues of debtor solvency assessment. The results of this process have extremely high importance in the case of corporate bankruptcy. If solvency can be recovered, turnaround management is advisable. Otherwise, it does not make sense to continue the business: a legal entity should be liquidated. The Russian legislation contains such provisions but there has been no methodological support provided. Therefore, the purpose of the study was to develop the methodology, which let evaluate the possibility of solvency recovery. The authors discuss a 'static' solvency model contained in the Draft Federal Financial Analysis Standard and propose an alternative 'dynamic' model. The idea of the original approach is to predict debtor solvency considering cash flows from operating, investing and financing activities of the company. It is assumed that the forecast period generally corresponds to the period of recovery procedures and debt repayment, cash flows reflect crisis financial condition of the debtor, and the discount rate is built in a cumulative way. The proposed model is tested on the example of an extracting company. The choice of this industry reasoned by its importance for the Russian economy. We suggest that even common guidelines on the debtor solvency assessment will strengthen bankruptcy framework in Russia. However, corresponding methodology should be adapted to the conditions of financial insolvency, requiring further empirical research.
Keywords: corporate bankruptcy, insolvency, debtor solvency.

1 Introduction

Prediction of debtor solvency is one of the priority tasks within financial analysis carried out to justify the choice of different bankruptcy procedures. The Russian legislation formulates such a task but there has been no methodological support provided. As a result, decisions on the future of the debtor are often not economically justified. This problem has been widely discussed in literature as a part of the discussion on low rehabilitation potential of the Russian bankruptcy system (Dushanina, 2011; Mamaeva, 2013; Akulova, Rjahovskij, 2014; Kochetkov, 2014; Kovan, 2014; Kovan et al, 2014; Lvova, Pokrovskaia, 2015). One of the possible approaches to its solution was presented in the Draft Federal Financial Analysis Standard (the Draft, 2012).

However, the proposed approach was introduced as a general concept only, what has determined the purpose of our study aimed to develop the methodological support for assessing recoverability of debtor solvency. The article covers three key questions: application issues of the debtor solvency model, which was proposed in the Draft; characteristic of the alternative authors' model; testing the suggested model through the example of an insolvent debtor.

Assessment of the financial condition considerably corresponds to tasks within investment analysis. Thus, American practice uses a profit capitalization method for justifying rehabilitation procedures (Altman and Hotchkiss, 2006). In Russia, the application of this method is limited due to at least two main reasons: underdeveloped stock market and profit indicator manipulation. Financial statements of an insolvent debtor are subject to manipulation. This situation is typical for developing markets being no exception for the developed ones (Agarwal, Taffler, 2008). In Russia, this is one of the most pressing issues. According to the official statistics, on average one third of the Russian companies

make losses year after year (Russian Finance, 2002-2014), what can be to large extend explained by low quality financial reporting. It is widely held that cash flow should be given priority for assessing financial condition of the enterprise (Ivanov, Tsitovich, 2009) including recoverability of debtor solvency.

Application of the dynamic model requires justification of the discount rate. Since this model engages Cash Flow to Equity (CFE), the Capital Asset Pricing Model, CAPM is traditionally used for this purpose[1]. However, it is inadvisable to turn to the CAPM as privately-held companies prevail in the Russian corporate sector while public ones, as a rule, show low liquidity of shares (Darushin, Lvova, 2015). Abstracting away from extensive criticism of the CAPM which was meticulously systematized in E. Fama and K. French's study (Fama, French, 2004), it should be pointed out that this model can be modified taking into consideration liquidity risk (e. g., Acharya, Pedersen, 2005). But the possibilities to apply it within the Russian market are limited as a lot of issuers' free-float level is low. In our view, the Adjusted Capital Assets Pricing Model (ACAPM) is preferable as it allows to approach special features of business in a more flexible way.

2 Methodology

2.1 The Static Model of Debtor Solvency

As noted above, prediction of debtor solvency is much-needed in bankruptcy procedures. It can be resorted to complete the following tasks: choose bankruptcy procedure (rehabilitation or liquidation); develop strategy and tactics for recovering solvency; justify the decision to dismiss crisis management and pass on to business liquidation.

According to the Draft, such an assessment should be made by comparing two sums: money that can be obtained through rehabilitation procedures and debts to be settled within the running period. The reliability of conclusions made through this formula is questionable enough. As a matter of fact, this is about the static model of debtor solvency. However, the assessment of the forecasted cash flow, elements of which belong to different time points, should be carried out with reference to the time value of money (TVM), also it is necessary to compare figures discounted by the time of assessment and, furthermore, every period should have a justified discount rate.

The order of cash flow assessment should be outlined more clearly while in the Draft it is described in broad terms (what is proposed is taking into consideration the sum that might be accumulated by a debtor through an economic activity during rehabilitation procedures as well as another sum that can be obtained through selling surplus assets).

The assessment of surplus assets is a separate issue. The value of assets which can be sold to pay off creditors, cover legal costs and pay court-appointed manager remuneration is determined as the total value of assets excluding the value of those assets without which primary activity becomes impossible; input VAT; and assets sales of which is problematical. The proposed method is inconsistent as this refers to book values.

2.2 Dynamic model of debtor solvency

The idea behind our approach is to predict solvency using a model based on cash flows from operating, investment, and financial activities. Structuring cash flow based on main activities reflects the traditional approach of planning corporate solvency through a direct method (Ivanov, Tsitovich, 2009). As it is known, operating cash flow is related to the income-generating main activity. Cash flow from investment activities shows the incurred cost of acquired resources intended for generating future income. Cash flow from financial activities renders inflows and outflows emerging as a result of raising funds as well as following interest and principle.

Following this logic, it is necessary to take into consideration cash flow related to regular business activity when assessing debtor's solvency over the forecast period by operating cash flow. Suppose

these kinds of inflows and outflows do not fundamentally differ from corresponding cash flow at a regularly functioning enterprise. However, as for investment and financial cash flows, they have their own specific. Investment cash flow should include inflows obtained through selling surplus assets. Taking into consideration difficult financial position a given company is in, capital expenditures are unlikely to be made, what is, in contrast, a typical situation for a solvent company. Whereas it is suggested that interest to be paid during rehabilitation procedures is considered as a part of financial cash flow.

Forecast values should not be accepted as a single sum as it is put in the Draft, but it should be taken into consideration that surplus assets shall be liquidated and income from ongoing operations shall be distributed over time. The same approach is relevant in terms of meeting debt obligations. Consequently, this provides basis for applying dynamic model of debtor solvency[2]. Forecast period in a common case corresponds to the period of rehabilitation procedures and settlements with creditors (according to Russian law, such a period may not exceed two years).

The proposed model of debtor solvency can be described by the following formula:

$$PV_{CF} = \sum_{k=1}^{2} \frac{CF^{op}{}_k + CF^{inv}{}_k + CF^{fin}{}_k}{(1+R)^k} \quad (1)$$

PV_{CF} – present value of expected cash flows; CF^{op} – cash flows from operating activities; CF^{inv} – cash flows from investment activities; CF^{fin} – cash flows from financial activities; R – discount rate; k – the number of periods.

As for conclusions regarding financial condition of a debtor, *in case the final result is not negative one may state that corporate recovery is possible*.

In this study, we apply the ACAPM model to determine a discount rate. This model can be described by the following formula (see e. g., Grjaznova, Fedotova, 2009):

$$R = R_{rf} + \beta(r_m - r_{rf}) + S_1 + S_2 + C \quad (2)$$

R – discount rate in question; R_{rf} – risk-free rate; β – beta; R_m – expected market return; S_1 – small capitalization premium; S2 – risk premium due to company-specific risk factor; C – country risk premium.

This build-up model, which is widespread in the Russian practice of business valuation, goes back to a study by C. Mercer (Mercer, 1989)[3]. Taking into consideration that there is no straightforward recommendations regarding applying the ACAPM in Russia, the authors used recommendations on business valuation as it was put in Deloitte & Touche best practices (Methods and Guidelines, 2006)[4]. Discount rates were calculated for most important industries in the Russian economy based on the minimal value of corporate capitalization (Ibbotson, 2015) and the country risk premium for the Russian Federation (Damodaran, 2016). Authors' calculation results are presented further in a table (Table 1) and a diagram (Fig. 1).

Table 1: Discount Rates for the Most Important Industries of the Russian Federation

Industry	Rate
Aerospace Defense	26.43%
Building Materials	25.84%
Bank	25.77%
Coal & Related Energy	26.17%
Farming & Agriculture	25.83%

Industry	Rate
Homebuilding	25.56%
Metals & Mining	26.91%
Oil Gas (Integrated)	20.49%
Oil Gas (Production)	27.36%
Oil Gas (Distribution)	25.61%
Paper & Forest Products	27.26%
Power	24.08%
Retail (General)	25.81%
Steel	26.28%
Telecom. Services	24.52%
Transportation (Railroads)	25.64%

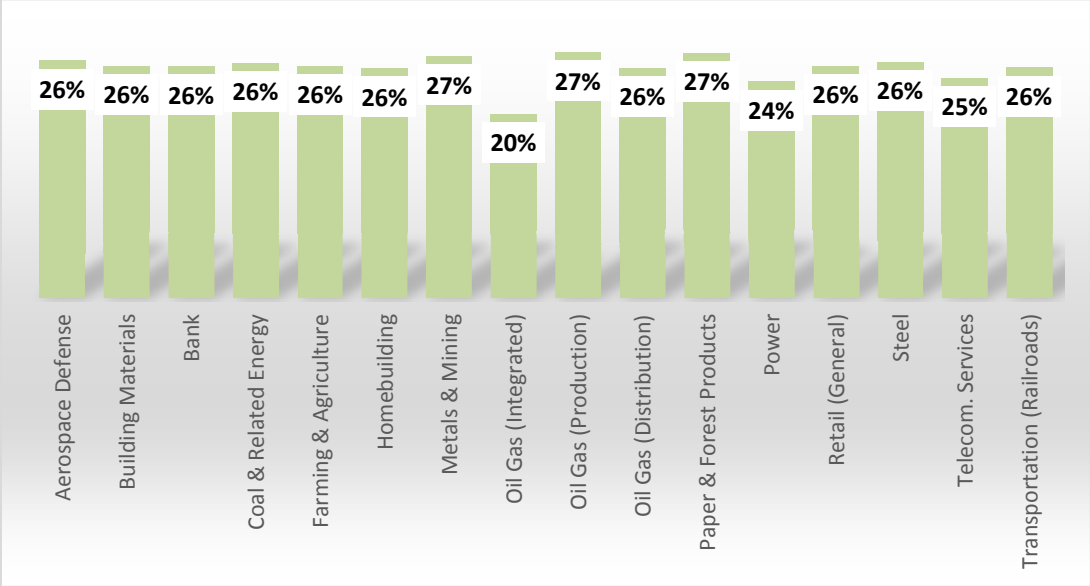

Fig. 1. Discount rates for the most important industries of the Russian Federation

As the above data show, values do not differ much. Specific corporate risks were set at an average level of 2.5%. However, this estimate is an approximate one as any enterprise has specific features that are often rather critical.

3 Application

The application of the suggested model will be considered through the example of an insolvent company residing in the Russian Federation, functioning as an LLC (limited liability company) and representing medium-size business. An extracting company was chosen to illustrate the suggested method purposely. Extractive industry is the most interesting to research taking into consideration its importance for the Russian economy.

The company extracts building stone from a gabbro-diabaser deposit in Kondopozhsky District, Republic of Karelia and also produces gabbro-diabaser breakstone of different grades, road base and surface materials. Owned crushing and screening equipment processes 400 tons of mined rock per hour. Shipping is done by train with loading at a separate railroad track. The company holds a license for mining building stone and breakstone production valid through 30.12.2025. The term of using the site of subsurface resources may be prolonged if it is necessary to complete mining and carry out liquidation activity.

Currently the company has overdue taxes, charges, and salaries payable, loans and credits indebtedness and has limited control of its bank account. The company is involved in approximately twenty lawsuits. Namely, the commercial court is hearing a legal action for recovery of debts for provided works, services and products as well as a liquidation of a legal entity due to the negative value of net assets over the last three years. Upon the application of a counterpart, bankruptcy proceedings were initiated against the Company. The observation procedure was introduced (it is a compulsory opening procedure in case of corporate insolvency).

Financial report shows considerably unsatisfactory financial condition of the Company. In particular, total balance has declined and net assets have been negative over the last few years. The Company operates at a loss. The main sources of financing are credits and loans. The efficiency of business operations declined due to the reduction in revenue, what increased financial cycle that lasted according to the results of the last reporting period more than 180 days.

The information on current financial condition of the Company, marketing research and experience and knowledge of the financial consultant in the industry served as a basis for valuation. A forecast on sales, cost price, commercial and administrative expenses, other revenues and expenses, and working capital was made when generating cash flow from operating activities.

Sales forecast of the Company was made by volume of sales and prices. Volume of sales was forecasted based on equipment capacity. Given that the quarry operates 365 days a year on a double-shift basis with the new crushing and screening machine capacity of 300 tons/h (7,200 tons/day) maximum annual efficiency is 2,628,000 tons/a. Standard volume of production is 1,423,500 tons/a utilization rate being 54%. Price forecast takes into account current average prices for corresponding grades and expected price increase at the rate of inflation.

Cost price forecast was made on information about average cost price per piece of product (breakstone of different grades) based on historical data. Cost price of delivery was defined based on corresponding profitability of the service. Average profitability of delivery services varies from 30 to 35%. The value of 30% was used as the forecast one. Inflation rate growth was taken into consideration to make cost price forecast.

Administrative cost forecast was based on information that monthly conditional-constant expenses of the Company were approximately 13,708 thousand rubles at full available capacity of the equipment[5]. Whereas other costs forecast took into consideration quarterly tax payments and other mandatory payments. Besides, expenses for bankruptcy administration were taken into account as a single value according to the Company's data.

Amortization costs were forecasted according to corresponding standards and taking into account the purchase of fixed assets, i.e. a locomotive engine[6].

Working capital forecast was based on the following: such parameters as sales of current inventories, recovering of accounts receivable, satisfaction of accounts payable; and creating current assets as a result of operating activities.

The sales of current inventories corresponds to the volume of products in stock and market prices. Corresponding incoming cash flow is expected to be 25,119 thousand rubles. The Company's accounts receivable are estimated to be 52,086 thousand rubles. This amount is maximum that can be received upon the results of debt recovery. In case of assignment of receivables, the incomings will not exceed 10-20% of the claimed sum. Therefore an average value of 15%, i. e. 7,813 thousand rubles was used as a forecast value. As for accounts payable, creditor's register of the Company includes claims for 656,014,606.59 rubles, such as:

– RUR 32,224.75 – claims of secondary lenders;
– RUR 633,515,791.66 – claims of third-priority lenders;

– RUR 22,466,590.18 – claims of third-priority lenders regarding compensation for damages, penalty recovery, and imposing other financial sanctions.

Apart from register claims, the Company is in arrears with current payments accounting for RUR 64,543,724.41 that have priority status. According to the plan, accounts payable are satisfied as soon as funds become available until Q3 2016.

Working capital forecast is based on the data of the company analysis system 'SPARK' regarding the days sales of inventory typical for the given business area: for inventories average days sales over the analyzed period is 5 days, for both accounts receivable and payable it is 30 days.

Discount rate is used to evaluate cash flow and is defined with the ACAPM method for the extractive industry (tab. 1) at the level of 29.41% per annum[7].

This is followed by the final financial and cash flow statements of the Company (tab. 2, 3).

Table 2. Income Statement Forecast

In thousands of rubles	Q4 2014	2015	2016
Total revenue	383 469	1 913 744	2 012 449
Cost of revenue	(290 343)	(1 442 373)	(1 515 033)
Gross profit	93 125	471 371	497 416
Selling expenses	-	-	-
Admin. expenses	(16 707)	(60 932)	(61 776)
Operating income	76 418	410 439	435 641
Other expenses	(2 858)	(4 368)	(4 668)
Income before tax	73 560	406 071	430 972
Tax	-	(34 492)	(86 194)
Net income	73 560	371 578	344 778

Table 3: Cash Flow Forecast

In thousands of rubles	Q4 2014	2015	2016
Operating Activities			
Net Income	73 560	371 578	344 778
Amortization	8 061	33 608	33 608
Changes in Working Capital	(80 538)	(392 282)	(233 880)
Changes in Inventory	21 252	(1 907)	(279)
Changes in Accounts Receivable	(23 705)	(15 547)	(2 276)
Changes in Accounts Payable	(78 085)	(374 827)	(231 325)
Other changes	-	-	-
Cash from Operating Activities	1 083	12 905	144 507
Investing Activities			
Capital Expenditures	(800)	(12 000)	-
Other Investing Cash Flow Items	-	-	-
Cash from Investing Activities	(800)	(12 000)	-
Financing Activities			
Changes in Long Term Debt	-	-	-
Changes in Short Term Debt	-	-	-
Cash from Financing Activities	-	-	-
Net cash flow	283	905	144 507
Cash flow at the beginning of the period	-	283	1 188
Cash flow at the end of the period	283	1 188	145 694
Discount rate	29,4%	29,4%	29,4%
Discounted cash flow	274	745	84 849

It is possible to conclude upon the results of the presented statements that Company is able to recover its solvency in the upcoming years as its cash flow is positive. However, it is important to point out that the cash flow becomes tangible not until the second half of 2016 whereas in prior periods its amount is too sensible to the smallest changes in sales volume, prices, and cost price, and in case of unfavorable changes in business environment this positive result may become negative.

4 Conclusions and Discussion

Prediction of solvency under the threat of bankruptcy is a complex task that has no one-and-only solution. The suggested model needs to be specifically adjusted to an analyzed company and requires further investigation of financial insolvency. However, even common guidelines on this issue will surely improve the quality of the Russian bankruptcy system since corresponding decisions become more transparent.

As for further studies, forecast assessment of debtor solvency can be made for a longer period and not limited by the period of crisis management and debt repayment. The suggested model may be developed according to the scenario approach in the framework of which the recoverability of solvency gets a probabilistic assessment. Besides, the question of specific features of an industry deserves a dedicated approach.

In conclusion, faulty forecast may be explained not only and not so much by the lack of clear-cut and wise guidelines regarding this issue, but also by a number of specific reasons. Direct and indirect costs related to bankruptcy procedures are often so high that inviting additional specialists becomes impossible or economically unjustified. At the same time, financial forecast accuracy depends largely on the quality of planning crisis response measures. It is impossible to completely abstract from the risk of having unanticipated loss related to illegal actions in case of bankruptcy. It is hard to assess precisely this kind of risk while its impact on Russian companies is often rather critical.

Notes

[1] Cash Flow to Firm (CFF) is a possible alternative (Kaplan, Ruback, 1995; Gilson et al, 2000), WACC being used for its assessment or other additional adjustments being introduced (Ruback, 2002). However, in this case the cash flow related to raising debt funding is not taken into consideration, what does not correlate with assessment purpose.

[2] Initially, this approach was introduced in (Abramishvili, Lvova, 2015).

[3] Other models also exist. For instance, there is a so-called 'polling approach' that implies that cost of capital is figured after holding a poll among persons who might invest in a given industry based on a required profitability (Damodaran, 2012). However, this approach is unlikely to be applicable to insolvent enterprises due to confidentiality of investments in a business at risk of liquidation. For an alternative representation of the ACAPM see (Sorin, 2009).

[4] In addition, theorizations regarding the evaluation of certain parameters of the model by T. Ogier and A. Damodaran were taken into consideration. The data from Ibbotson SBBI, 2015 Valuation Yearbook were used to determine low capitalization risk.

[5] Administrative costs forecast took into account not only such factors as inflation and seasonality of production, but also utilization rate as these costs are conditional-constant and consequently depend partially on dynamics of debtor's main activity.

[6] Amortization costs are forecasted separately for an indirect cash flow forecast (based on profit indicator).

[7] The rate indicated earlier in the table was increased by 2.5%: specific risks of the company were taken into account at the maximum level due to experienced financial difficulty.

Trust-Based Recommender Systems: An Overview

Afef Selmi, PhD.Student, Tunis, Tunisia, selmiafef.fst@gmail.com
Zaki Brahmi, Assistant Professor, Sousse, Tunisia, zakibrahmi@gmail.com
Mohamed Mohsen Gammoudi, Full Professor, Tunis, Tunisia, gammoudimomo@gmail.com

Abstract

In a highly dynamic and decentralized environment, where data are uncertain, Trust has become a key factor in the process of decision making. Trust-based recommendation is based on Trust between users. It was the main subject of several studies such as: Haydar (2014), Simon et al (2012), Fabiana et al (2011), Golbeck (2005), Josang and Pope (2005). In fact, for relevant recommendation, it is very important to define the adequate techniques for modeling and evaluating trust between agents. In this paper, we give a state of the art of modeling trust in recommender systems. Furthermore, we make a comparative study between various existing methods.

Keywords: trust, trust relationship, trust models, trust-based recommender system.

1. INTRODUCTION

Simon et al (2012) mentioned that internet has become a tool used in several activities such as personal activities, educational activities, associative activities, etc. The available resource information which is heterogeneous and huge make the user perplexed to find the relevant information. To address this problem, classical information retrieval systems need an intelligent component to help user during his retrieval session. This component is defined as a recommender system. The main objective of this component is to provide information based on user needs and preferences. The task of recommendation is decomposed on subtasks which are realized by appropriate agents. To ensure a good recommendation, agents must cooperate between them. The cooperation assumes that there is a trust relationship between agents. The trust is defined in some works by some measures and modeled as a trust network.

In this paper, we present a state of the art on different methods of trust based recommender systems. The rest of the paper is organized as follows: the second section focuses on the recall of basic concepts of trust. The third section contains a state of the art of existing trust models used in recommender systems. The fourth section, describes a comparative study between these different models while emphasizing their advantages and disadvantages. At the end, we give a conclusion and some future works.

2. BASIC CONCEPTS OF TRUST

Trust has become a functional necessity in a social system that is characterized by the development of interpersonal relationships. In fact, the presence of this type of relationship encourages the sharing of knowledge. In Connelly and Kelloway (2000), trust is the most important condition for sharing knowledge between users.

In fact, Trust is a general concept that can be applied to any context. It plays an important role in several disciplines such as: sociology, psychology, computer sciences, recommender systems, etc.

In the following section, we present trust definitions and we describe their properties. At the end, we explain how trust value could be used as a binary or fuzzy value.

2.1 Definitions of trust

Trust has been defined in several fields such as psychology Deutsch (1962), sociology Dumouchel (2002), computer sciences Golbeck (2005) and recommender system Victor et al (2011).

In Psychology, Deutsch (1962) defined trust as: "the individual is confronted with an ambiguous path, a path that can lead to an event perceived to be beneficial (Va+) or to an event perceived to be harmful (Va-)". He perceives that the occurrence of Va+ or Va- is contingent on the behavior of another person and he perceives the strength of Va- to be greater than the strength of Va+.

In Sociology, Dumouchel (2002) described trust as: "a bet about the future contingent actions of the trustee. This bet, or expectation, is considered to be trust only if it has some consequence upon the action of the person who makes the bet (i.e., trustor)".

In computer sciences, Golbeck (2005) defined trust as: "a commitment to believe in the smooth running of the future actions of another entity". In another manner, Entity A trusts entity B, means the satisfaction of A on the performance of a task realized by B.

In recommender system, Victor et al (2011) described trust as: "the local belief of one user in the usefulness of recommendation provided by another user".

2.2 Properties of trust

In the web based social environment, trust has been described by some properties Bhuiyan et al (2010) and Golbeck (2005). These properties identify where trust exists in social networks, and how it can be used in computation Sana (2016).

In the following, we present some properties that are proposed by Golbeck (2005):

- Trust is asymmetric: if a user A trusts user B, this doesn't mean that B trusts A.
- Trust is not distributive: if user A trusts user B and C, this doesn't mean that A trusts B and A trusts C.
- Trust is not generic: if user A trusts user B in computer science, this doesn't mean that A trusts B in the health field.
- The property of transitivity is a challenge in trust modeling. Little works consider that trust is not transitive Abdul-Rahman and Hailes (2000), which goes against the majority of works that consider the transitivity as a critical feature in the modeling phase Haydar (2014) Herzig et al (2010), Josang and Pope (2005) and Simon et al (2012). There are also several works assume that trust is transitive but this transitivity needs certain constraints Christiansoon and Harbison (1996) and Josang and Pope (2005).

2.3 Values of trust

In social networking, trust present information about a social relationship between two users. This relationship is represented by a label. The label is described with different manners on different social networking such as Epinions[i], Advogato[ii].

The Epinions web of trust is a who-trust-whom online social network of a general consumer review site Epinions.com. Members of the site can decide whether to trust each other. The network consist of individual uses connected by directed trust and distrust links. Edges have the weight +1 for trust and -1 for distrust.

Advogato is an online community and social networking site for developers of free software. Users of this site can publish news about software they have released or post updated on anything they are working on. In fact, users certify each other in a kind of peer review process. On Advogato, nodes are users and the directed edges represent trust relationships. A trust link is called "certification". Three different levels of certifications are possible on Advogato, corresponding to three different edge weights: Apprentice (0.6), Journer (0.8) and Master (1.0).

3. Modeling Trust in Recommender System: State of the Art

According to Ma et al (2009), Massa and Avesani (2007) and O'Donovan and Smyth (2005), trust-based recommender systems are collaborative systems based on user relations who express trust between them. A famous example is the Epinions website, which recommend items liked by trusted

users. In fact, trust between two user means that a user believes on the utility of the recommendation of a trusted user.

Several Trust-based systems have been proposed since more than two decades. They affect many areas such as: semantic web Donovan and Yolanda (2007) and Wolfgang et al (2004), multi-agents systems Herzig et al (2010), cloud computing Wenjuan and Lingdi (2009), recommender system Massa and Bhattacharjee (2004) and multi-agent recommendation systems Fabiana et al (2010), etc.

In our work, we are interested on trusted relationships between users taking into account their skills in a given context (we mean by context the field of user's expertise). The relationship between users depends on the skill areas.

In the following sections, we examine different modes for trust based recommender systems. To do this, we classified these models into two categories: those that take the skill domain trust and those who doesn't take this property.

3.1 Approach with trust contextualization

Model of Abdul-Rahman

In Abdul-Rahman and Hailes (2000), the authors proposed a trust model that takes into account the trust context. They define trust as a subjective measure or a belief on a personal experience in a given context. This Belief takes a value among four values: *very bad, bad, good and very good* according to the user's opinion. For Abdul-Rahman, trust between two users is determined only by the interactions between them, since transitivity isn't taken into account. Two types of interactions are possible: the evaluation of experiences between two users and the acceptance of recommendations from user.

In this model, each user u has two sets X and Y where X contains his interactions and Y stores his opinions about users who provide recommendations.
Each element of X or Y is composed by a triplet (us, c, S); witch us, c and S represent respectively the affected user (the user who's trusted by u in the case of X or the user who recommended an item to u in the case of Y), the context (the topic of the task) and the set of user's opinions. An opinion can have four values: very bad, bad, good and very good.
Each element s of S represent an opinion of u about a user v in a context c. The opinion s is defined by a vector of four counters corresponding to the four values of the opinion. When u expresses an opinion about an interaction with v in a given context c, the counter corresponding to the value is updated. This vector is represented as follows:

$$\boldsymbol{S_u} = \{(\boldsymbol{s_{vb}}, \boldsymbol{s_b}, \boldsymbol{s_g}, \boldsymbol{s_{vg}})_{v_{c0}}, (\boldsymbol{s_{vb}}, \boldsymbol{s_b}, \boldsymbol{s_g}, \boldsymbol{s_{vg}})_{v_{c1}}\}$$

Where vb, b, g, vg denote respectively "very bad", "bad", "good" and "very good". The degree of the trust between u and v is the max between values of the four counters.

While this model is among the first that took into account the context of trust, it didn't take the transitivity of trust. Seen that the opinions of credible friends provide a positive effect on system performance. In Josang and Pope (2005), authors confirm that transitivity is very important for improving performance of trust-based recommender systems.

Model of Charif Alchiekh Haydar

The author proposes a three trust models taking into account the trust context such as: a local trust model, a collective trust model and a global trust model. The models are based on subjective logic Haydar (2014). For each model, the relationships between users are modeled by a trusted network. The trust relationship between two users X and Y is given by the opinion (according to subjective logic) of X on Y.

In the first model, each user uses his own opinions, and consults those of his friends in the absence of his own ones. The purpose of this model is to predict the response that the user will accept for his question. Formally, the final score is given by the following formula:

$$\boldsymbol{score}(\boldsymbol{r}) = \begin{cases} \boldsymbol{e}(\boldsymbol{a},\boldsymbol{r}) & \boldsymbol{if}\ \boldsymbol{e}(\boldsymbol{a},\ \boldsymbol{r}) \in \boldsymbol{E} \\ \sum_{j} \oplus \left[\boldsymbol{e}(\boldsymbol{a},\boldsymbol{f_j}) \otimes \boldsymbol{e}(\boldsymbol{f_j},\boldsymbol{r})\right] & \boldsymbol{else} \end{cases}$$

Where E and $e(a,r)$ represent respectively a set of opinions and a personal opinion between two users a and r.

Compared to the previous model, in the collective trust model, direct interactions between users aren't always sufficient to provide relevant information on the user. For this reason, collective opinions are used in all cases in this model. Thus, the user requests always the opinion of his friends to consolidate his opinion. The function that determines the opinions is given by the following formula:

$$\boldsymbol{score}(\boldsymbol{r}) = \begin{cases} \boldsymbol{e}(\boldsymbol{a},\boldsymbol{r}) \oplus \sum_{j} \oplus \left[\boldsymbol{e}(\boldsymbol{a},\boldsymbol{f_j}) \otimes \boldsymbol{e}(\boldsymbol{f_j},\boldsymbol{r})\right] & \boldsymbol{if}\ \boldsymbol{e}(\boldsymbol{a},\ \boldsymbol{r}) \in \boldsymbol{E} \\ \sum_{j} \oplus \left[\boldsymbol{e}(\boldsymbol{a},\boldsymbol{f_j}) \otimes \boldsymbol{e}(\boldsymbol{f_j},\boldsymbol{r})\right] & \boldsymbol{else} \end{cases}$$

For the context of trust, a global trust model is proposed by Haydar (2014), that is to say, the user X relies on the reputation of the target user to decide whether to cooperate with him or not. In this context model, the reputation score of a user is not absolute; it varies depending on the keywords extracted from the questions that the target gave a correct answer. Thus, the user profile is created based on its reputation by keywords. When the user provides an accepted response to a question, a link (opinion) is established between him and each of keywords associated with the question. After determining the reputation scores for different users who responded to a question, the new model attempts to order the list of users with the aim of predicting the accepted answer. The user with the highest reputation score will provide the accepted answer.

3.2 Approach without trust contextualization

MoleTrust

MoleTrust is a trust model proposed by Massa and Bhattacharjee (2004). In this model, Trust is defined by a binary value. The trust propagation is a basic property in MoleTrust. It is assumed that trust degree between X and Z isn't the same trust degree between X and Y. The propagation of Trust is expressed by transitivity. In fact, when user X trusts user Y, and Y trusts user Z, then X trust Z. In order to fix the trust propagation, authors defined a propagation having 4 as maximum distance between two users.

MoleTrust predicts the trust value between to users X and Z by using the following formula:

$$\mathrm{tr}(\mathrm{X},\mathrm{Z}) = \begin{cases} \dfrac{(\mathrm{d} - \mathrm{n} + 1)}{\mathrm{d}} & \text{if } \mathrm{n} \leq \mathrm{d} \\ 0 & \text{if } \mathrm{n} > d \end{cases}$$

Where d is the maximal distance of propagation and n is the distance between X and Z. Using transitivity, n = 2 because, there is only one intermediate between X and Z.

When existing several paths between X and Z, MoleTrust takes the shortest path and considers it the best one which maximizes the trust value. Compared to collaborative filtering, MoleTrust showed his performance in terms of recommendation accuracy. However, the choice of the shortest path doesn't always guarantee the best performance. Since, we can find a longer path with more knowledge about the target.

TidalTrust

In Golbeck (2005), author proposed the model TidalTrust for social networks. It is dedicated to recommend movies to users. In this model, each user can evaluate movies with a scale of 1 to 5 stars. He can also evaluate his trust to another user with a scale of discrete values in [1, 10]. In fact, the trust networking between users is represented by a directed graph.

TidalTrust allows a source to deduct the score of a movie m from the recommendation scores of other evaluators of the same movie. Formally, the recommendation score rsm deduced by a source s of a movie m is determined by the following formula:

$$\mathbf{r_{sm}} = \frac{\sum_{\mathbf{s} \in \mathbf{adj(S)}} \mathbf{t_{si}} \times \mathbf{r_{im}}}{\sum_{\mathbf{s} \in \mathbf{adj(S)}} \mathbf{t_{si}}}$$

Where: $\mathrm{adj}(s) \in S$, t_{si} and r_{im} represent respectively the nodes directly connected to the source, the trust score between the node s and its neighbor and the score of the movie m given by the node i.

Compared to MoleTrust, Massa and Bhattacharjee (2004), in which the trust value is binary, TidalTrust allows the user to express a gradual trust to other users. However, this model didn't take into account the trust contextualization. Also, it didn't consider neither the length of path nor the various possible paths.
In addition, author hadn't studied the risk, that's to say he hadn't defined a threshold that allows the user to choose the movie or not.

Model of O'Donovan

Authors propose a model for trust-based recommendation systems. It is mainly based on collaborative filtering. The main idea of this model is to add a layer of trust to the collaborative filtering with changes in the used terms. In this new model, the user is called "consumer" and the neighbors are called "producers". To add trust to the collaborative filtering, three methods are proposed: a weighting method, a filtering method and a combining method, O'Donovan and Smyth (2005).

The first method consists on replacing the similarity in the collaborative filtering by the value w (c, p, i) where c represents the consumer, p represents the producer and i represents the item. Formally, it is defined by the following formula:

$$w(c,p,i) = \frac{2 \times similarity(c,p) \times reputation(p,i)}{similarity(c,p) + reputation(p,i)}$$

Knowing the reputation of a user which is expressed by the percentage of correct predictions in which he was produced.

The second method consists of three steps:
Firstly, the determination of the set of neighbors using the collaborative filtering. Secondly, selection of only neighbors with a reputation of the item which exceeds a threshold using a trust filters. Thirdly, the prediction of the recommended items by applying the same formula used for collaborative filtering is done.
The third method is called hybrid because it combines the two previous ones. In fact, after determining the set of neighbors by collaborative filtering (used in second method), the hybrid method computes the weighting using the formula w(c, p, i) defined in the first method.

Although this model shows its effectiveness in improving the performance of collaborative filtering, Haydar (2014). However, it didn't take into account the trust contextualization.

Model of Simon

The author proposes a social recommender system based on the social connections between the users. In this system, only trusted users can communicate. Thus, trust is an explicit value. The purpose of this system is to predict the missing notes which are called scores between a user and an object. To do this, they proposed an algorithm based on five different steps which allow obtaining the missing scores. Each step tries to perform the last one and they are more described in Simon et al (2012).

The first step called Immediate Social Scoring, determines the score of an object i by user a. In fact, it is equal to the score between them; if it exists elsewhere the score is the combination of the different scores of his friends.

The second step called K-Depth Social Scoring, is an extension of the first one. Its principle is to use the friends' propagation which means to apply the first step on friends of friends to a deep K.

The third step called Correlative Social Scoring, the authors introduced a correlation coefficient between users to refine trust between them. The correlation is calculated only among direct friends.
Relative Social Scoring is the fourth step which computes a relative score that is defined by the difference for each user between the score and the average of ratings. Furthermore, it aggregates and adds the relative scores for the average of scores of the affected user.

The last step of the algorithm called CorrRelative Social Scoring which consists of a combination of different steps.

Although this model shows its effectiveness in terms of prediction, experimental studies have shown that it has given poor coverage using direct relations (k=1) compared to other algorithms of recommendation. Propagating at a depth k=2, to improve coverage, the obtained results show that this propagation implied a loss of accuracy.

4. COMPARATIVE STUDY OF TRUST MODELS

In this section, we present a comparative study on different trust models. We take the comparison criteria used in Haydar (2014). Furthermore, we observe that there are two kinds of techniques for trust modelling. The first one is based on mathematical foundation such as subjective logic and the second one is based on measure to predict the trust scores. To differentiate between models according to this observation, we use the criteria "the used technique".

Criteria's used in Haydar (2014) are: trust relationship, trust note, trust value, trust propagation, trust aggregation and trust contextualization.

Trust relationships: for modeling trust, each model uses a type of trust relationships which could be local, collective or global. In local relationship user uses their own opinions to collaborate with other users. However, in the collective relationship, the user must usually take into account the opinion of his friends about whom user he will collaborate. The global relationship is based on the reputation of the user.

Trust note: the note of trust between two users is either Explicit or implicit. The first one is defined directly by users, but the second one is obtained by inference on the user's history.

Trust value: trust between two users can be a binary value or gradual value which is between [0, 1].

Trust propagation: is obtained by a prediction process of trust score along a path between two users.

Trust aggregation: is a process of combining several trust scores from different paths.

Trust contextualization: trust between users is strongly related to the context. It is not an absolute value: that's to say, a user X can give a low trust to Y for the health field but it can give it a strong trust to the computer field.

Table 1: Comparison of trust models

		Abdul-Rahman and Hailes (2000)	Massa and Bhattacharjee (2004)	Golbeck (2005)	O'Donovan and Smyth (2005)	Simon et al (2012)	Haydar (2014)
Trust relationships	**local**	x	x	x	x	-	x
	collective	-	-	-	-	x	x
	global	-	-	-	x	-	x
Trust note	**explicit**	x	x	x	-	x	x
	implicit	-	-	-	x	-	-
Trust value	**binary**	-	x	-	-	-	-
	gradual	-	-	x	x	x	x
Trust propagation		-	x	x	x	x	x
Trust aggregation		-	-	x	x	x	x
Trust contextualization		x	-	-	-	-	x
Used technique	**used theory**	-	-	-	-	-	subjective logic
	used measure	-	distance between two nodes	-	similarity between users	similarity between users	-

Based on this comparative table, we note that:

- Most of the proposed models are based on local trust. This influences the recommendation performance because the local modeling has problems related to the lack of data Haydar (2014). In another manner, the decision is made with minimal user knowledge.

- For the trust propagation, we find that all research works except Abdul-Rahman and Hailes (2000), are based on the trust propagation between users. The trust propagation allows users which aren't directly connected to be able to predict a trust score. It is expressed by a conjunctive combination.

- Most of research works are based on trust aggregation mechanism to estimate trust between two users. This is to combine different trust scores determined by the propagation process from different paths. To compute the final score between two users, the disjunctive combination is used.

- To our knowledge, the trust contextualization is considered only in Abdul-Rahman and Hailes (2000), and Haydar (2014). Although, the model of Abdul-Rahman and Hailes (2000) is among the first models that treated this concept, but it didn't take into account the transitivity of trust that has become important in decision making.

The criterion of trust contextualization is considered in several works as essential for the quality of the decision. In our comparative study, we found that Abdul-Rahman and Hailes (2000), and Haydar (2014) take it into account.

In order to define a trust model taking into account the local, collective and global trust, the author Haydar (2014) uses the Subjective Logic (LS). Indeed, the LS has a better formal framework for modeling trust. It also allows representing the relationship of trust between users in the form of probabilistic opinions. An opinion in the subjective sense represents a resulted accumulation of several interactions between the user and the object of opinion (one item or another user). However, at the modeling of opinions, this theory has two drawbacks Emmanuel et al (2008): first, it models different views in the same way, that is to say, by the principle of equal probability. On the other hand, it only models singleton opinions.

Actually we are working on trust model definition which is based, on the theory of belief functions, introduced by Smets (1994), for several advantages thanks to his Transferable Belief Model. It is a richer and more flexible framework to model different ways distinct opinions. Indeed, it allows modeling of composite hypotheses, imperfect information and merging information from different resources Ahmaed (2014), Emmanuel et al (2008) and Patrick (2001). The strength of this model is manifest in the fusion of information from different sources to make an interest decisions.

Furthermore, we will use formal concept analysis approaches for organization and representation of agents. The choice of formal concept analysis is justified by the sound mathematical foundation and its algorithmic branch for organizing agents in the form of groups that support the notion of collective trust. In addition, the Galois lattices allow expressing a semantic due to the partial order relation between groups Ganter and Wille (1999).

5. Conclusion

In this paper, we presented an overview on trust-based recommendation models. We have highlighted the advantages and limitations of each model. We did this work in the objective to justify the choice of our new approach for trust-based recommendation system. In the future work we plan to implement our new model which is based on formal concept analysis for agent representation and the theory of belief function for decision making.

Introduction des items inversés dans les échelles de mesure : Application à l'échelle du partage des connaissances

Sanaa Boukhari, Professeur à l'Université Mohammed V de Rabat, Maroc, sanaboukhari@yahoo.fr

Résumé

Cette recherche a pour objectif de discuter l'intérêt de l'utilisation des items inversés dans une échelle de mesure. La variable Partage des connaissances a été prise comme cas d'application. L'étude des qualités psychométriques de celles-ci, menée sur un échantillon de 383 collaborateurs appartenant à deux grandes entreprises, a montré que cette échelle présente une validité et une fiabilité satisfaisantes. Toutefois, les deux items inversés initialement introduits ont été supprimés lors des analyses factorielles exploratoires. Ce résultat sera discuté dans le cadre de ce travail.

Mots-clés : Items inversés, Echelle de mesure, Partage des connaissances, Validité, fiabilité.

Introduction

La présente communication a pour objectif de discuter l'intérêt de l'utilisation des items inversés (*reverse-coded*) dans une échelle de mesure. Un item inversé est définit comme un item dans la structure grammaticale est opposée au contenu de la variable, c'est-à-dire aux autres items de l'échelle (par exemple, structure grammaticale positive *versus* structure grammaticale négative). A ce titre, plusieurs auteurs notamment Igalens et Roussel (1998) ont recommandé d'introduire ces items inversés dans les échelles de mesure. L'objectif étant de susciter plus de concentration de la part du répondant et améliorer la fiabilité et la validité du questionnaire. En effet, l'utilisation des items inversés permettrait d'éviter l'effet de halo, définit comme le risque de voir une personne répondre avec la même modalité de réponse à l'ensemble des énoncés. Néanmoins, il faut noter que si Igalens et Roussel (1998) ont insisté sur l'utilisation des items inversés, d'autres auteurs comme McLaughlin (1999) ont souligné l'impact négatif de l'introduction de ce type d'items sur la validité et la fiabilité d'un instrument de mesure. Ceci dit, la présente recherche naît de ce constat, et soulève de ce fait une problématique très rarement traitée dans les travaux en Sciences de Gestion. Celle-ci a donc pour objectif d'étudier l'impact et l'intérêt de l'utilisation des items inversés dans une échelle de mesure.

Par ailleurs, afin de répondre à cette problématique, nous avons choisi l'échelle 'Partage des connaissances', comme objet d'étude. Cette échelle initialement constituée de 7 items comprend deux items inversés. A ce titre, la démarche qui sera suivie pour la validation de l'échelle étudiée est celle du paradigme de Churchill (1979).

Ainsi, après la phase de spécification du domaine du construit et la génération d'un échantillon d'items à partir de la revue de littérature, la démarche du paradigme de Churchill sera poursuivie selon deux principales phases : une phase d'analyse exploratoire et une phase d'analyse confirmatoire. L'objectif étant de purifier les échelles initialement adaptée de la littérature. Concernant la dernière étape, dans ce travail, nous ne pouvons établir des normes à partir de l'échelle étudiée. En effet, cette étape suppose que la validité des échelles soit parfaitement établie et nécessite un échantillon représentatif (Le Louarn, 1997).

Ainsi, nous présentons dans un premier temps l'échelle « Partage des connaissances ». Ensuite, nous exposerons les résultats de l'analyse factorielle exploratoire et confirmatoire avant de les discuter.

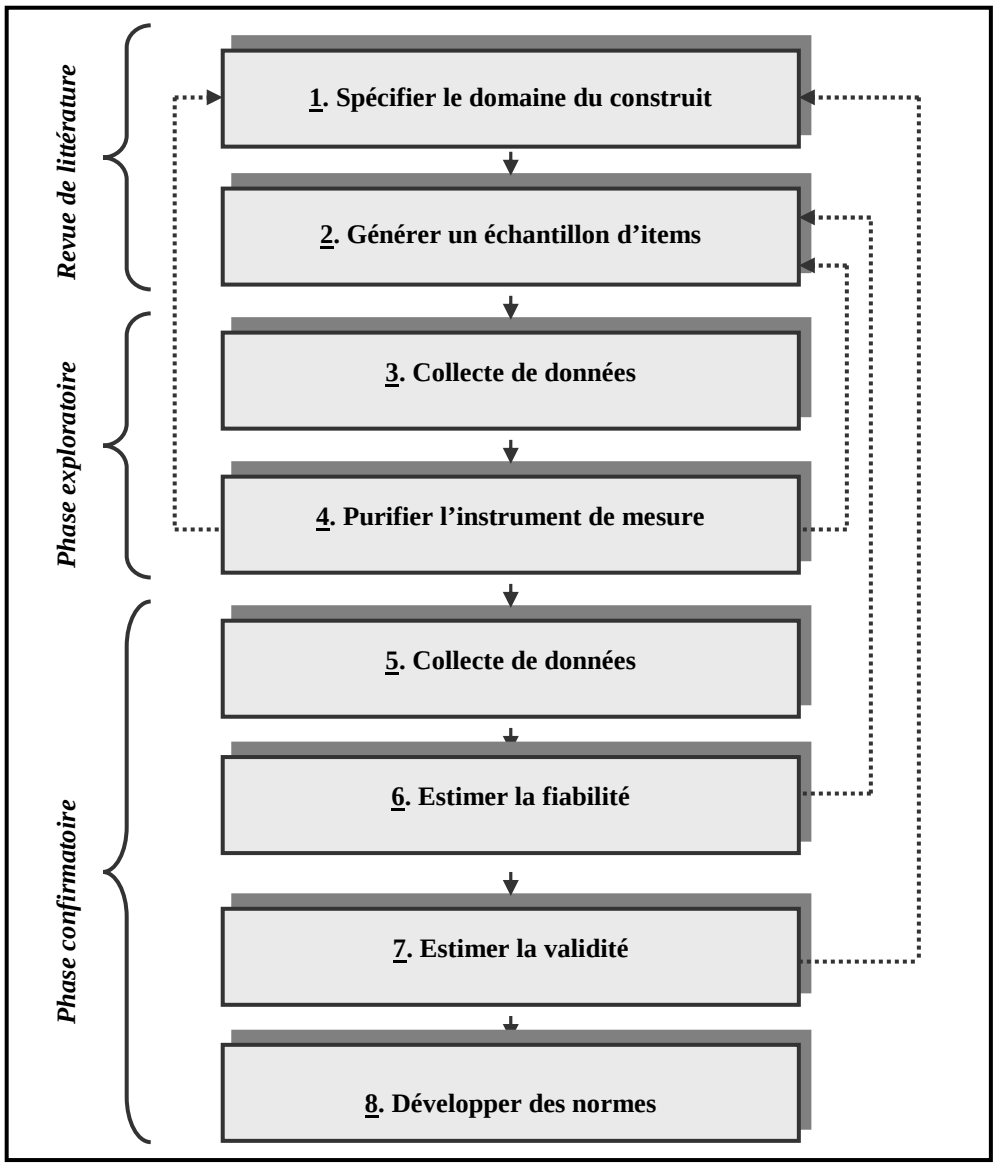

Fig. 1 Démarche du paradigme de Churchill (1979)

1. Présentation de l'échelle étudiée

La variable Partage des Connaissances mesure le degré selon lequel un individu estime partager ses connaissances avec les autres membres de son organisation. Afin d'opérationnaliser cette variable, nous avons recensé dans la littérature concernant la gestion des connaissances, les différentes mesures de cette variable. Le tableau suivant représente une synthèse de ces mesures.

Tableau 1: Mesures de la variable 'Partage des connaissances'

Liao et al. (2004)	33 participants à un projet de gestion des connaissances.	**1.** It is my pleasure to share my working experience and knowledge to my colleagues voluntarily. **2.** I will share my working experience and knowledge to

		my colleagues conditionally.
Burgess (2005)	480 managers	**1.** Outside of requests within your project team(s), how many hours per week do you spend sharing information with others ?
Zhao et Luo (2005)	121 filiales étrangères aux Etats-Unis, en Europe et au Japon.	**1.** How often do you engage in the exchange of the (expertise / information…) using phone, fax, email and other means with peer subsidiaries and headquarters ?
de Vries et al. (2006)	424 employés appartenant à différentes équipes de travail et différentes organisations.	**1.** When I've learned something new, I tell my colleagues about it. **2.** I share information I have with my colleagues. **3.** I think it is important that my colleagues know what I am doing. **4.** I regularly tell my colleagues what I am doing.
Lu et al. (2006)	246 participants (étudiants et employés)	**1.** In daily work, I take the initiative to share my work-related knowledge to my colleagues. **2.** I keep my work experience and never share it out with others easily (r). **3.** I share with others useful work experience and know-how. **4.** After learning new knowledge useful to work, I promote it to let more people learn it. **5.** I never tell others my work expertise unless it is required in the company (r). **6.** In workplace, I take out my knowledge to share with more people. **7.** I actively use IT sources available in the company to share my knowledge. **8.** So long as the other colleagues need it, I always tell whatever I know without any hoarding. (Items 6, 7, 8 sont adaptés de Bock et Kim, 2002)
Hsu et al. (2007)	274 participants à 9 communautés virtuelles, organisées sur Yahoo.	**1.** I frequently participate in knowledge sharing activities in this online community. **2.** I usually spend a lot of time conducting knowledge sharing activities in this online community. **3.** When participating in this online community, I usually actively share my knowledge with others. **4.** When discussing a complicated issue, I am usually involved in the subsequent interactions. **5.** I usually involve myself in discussions of various topics rather than specific topics.

r : reverse-coded item est un item inversé par rapport au contenu de la variable.

Les différentes échelles synthétisées dans le tableau ci-dessus mesurent le comportement de partage des connaissances. Comme l'expliquent Lu et al. (2006), la recherche empirique portant sur le partage des connaissances est encore à ses débuts. C'est pour cette raison qu'il n'existe pas encore une échelle communément admise afin de mesurer cette variable.

Afin de répondre à notre objectif de la recherche, nous avons choisi de mesurer cette variable par l'échelle proposée par Lu et al. (2006). En effet, outre sa richesse (une multitude d'items), cette échelle représente un excellent degré de fiabilité avec un alpha de Cronbach de 0,90.

Toutefois, nous n'utilisons pas cette échelle dans son intégralité. En effet, nous sommes réservées quant à l'utilisation de l'item n° 7. Cet item, emprunté au travail de Bock et Kim (2002), nous semble, proche de l'utilisation du Système de Gestion des connaissances plus que du partage des connaissances. C'est pour cette raison que nous l'excluons. Après cette modification, nous présentons ci-dessous la traduction des items retenus pour mesurer la variable 'Partage des connaissances'.

Tableau 2 : Echelle de mesure de la variable 'Partage des connaissances'

Item	Libellé
PARK_1	Dans mon travail quotidien, je prends l'initiative de partager mes connaissances avec mes collègues.
PARK_2	Je garde pour moi mon expérience professionnelle et ne la partage pas facilement.
PARK_3	Je partage avec les autres des expériences et savoirs-faire professionnels utiles.
PARK_4	Après avoir acquis de nouvelles connaissances utiles au travail, je les diffuse afin que les autres puissent en profiter.
PARK_5	Je ne parle jamais de mon expertise professionnelle aux autres sauf si ma hiérarchie me le demande.
PARK_6	Au travail, je diffuse mes connaissances en les partageant avec d'autres personnes.
PARK_7	Tant que mes collègues en ont besoin, je partage toujours tout ce que je sais sans aucune rétention.

2. Méthodologie de collecte des données

Après la phase d'opérationnalisation de la variable 'Partage des connaissances', nous avons administrés le questionnaire auprès de 2200 collaborateurs, appartenant à deux grandes entreprises, considérées comme des leaders mondiaux de l'industrie alimentaire et de la haute technologie. La diffusion de celui-ci s'est effectuée par Internet, en envoyant un message électronique (e-mail) à la population cible. Le message électronique diffusé comportait une adresse URL sur laquelle le répondant doit cliquer afin d'accéder au questionnaire. Aussi, deux versions, française et anglaise, ont été prévues. Au final, 383 questionnaires valides ont été intégrés dans notre base de données.

Cet échantillon, conformément à la démarche du paradigme de Churchill, a été par la suite scindé en deux sous-échantillons. Le premier est destiné aux analyses exploratoires (N=100). Le second a servi aux analyses confirmatoires (N=283). Cette répartition a été effectuée sous SPSS, de manière aléatoire à partir de l'échantillon global.

3. Résultats

Nous présenterons dans un premier temps les résultats de l'analyse factorielle exploratoire, ensuite ceux de l'analyse factorielle confirmatoire.

3.1 L'analyse factorielle exploratoire

L'analyse factorielle exploratoire (AFE), en l'occurrence l'analyse en composantes principales (ACP), permet d'identifier un ensemble de dimensions latentes à partir de variables observables initiales. L'ACP permet également de réduire le nombre de variables initiales en un ensemble plus restreint, destiné à se substituer aux précédentes dans les analyses statistiques (Evrard et al., 2003).

Avant de lancer une ACP, il convient tout d'abord de s'assurer que les données sont *factorisables*, c'est à dire que celles-ci constituent un ensemble suffisamment cohérent pour qu'il soit raisonnable d'y chercher des dimensions communes (Evrard et al., 2003). A ce titre, deux tests formels sont effectués : le test de sphéricité de Bartlett et le KMO. Les deux tests susmentionnés sont complétés en vérifiant la diagonale de la matrice anti-image. Celle-ci reprend le MSA (Measure of Sample Adequacy) pour chaque variable. Un MSA inférieure à 0,5 peut indiquer que la variable concernée n'est pas adaptée à la structure des autres variables.

Une fois les conditions d'application d'une ACP remplies, il faudrait déterminer le nombre de facteurs à retenir. En effet, l'objectif d'une ACP consiste à déterminer de nouvelles variables composées à partir d'un ensemble de variables initiales. Il faut donc choisir un nombre restreint de facteurs afin d'avoir une analyse lisible. D'un autre côté, il faut que les axes retenus reproduisent l'essentiel de l'information fournie par notre base de données. Nous nous trouvons donc face à deux objectifs contradictoires. Afin de répondre à ces deux objectifs et déterminer le nombre d'axes factoriels à retenir, nous nous appuyons sur quatre méthodes différentes : le test de Cattell, la restitution minimum, le critère de Kaiser et le test MAP de Velicer. Une fois le nombre d'axes factoriels déterminé, il convient d'effectuer une rotation *Varimax* afin de mieux interpréter les facteurs obtenus. Une rotation permet d'augmenter artificiellement la valeur des coefficients de corrélation des variables les plus corrélées, et de diminuer celle des variables les moins corrélées.

Enfin, la fiabilité (ou fidélité) sera également étudiée dans le cadre de ces analyses. Celle-ci correspond à la cohérence entre les items qui sont censés mesurer un même concept. Une échelle fiable produit les mêmes résultats lors de mesures répétées, quelles que soient les personnes qui l'utilisent et quel que soit le moment où le test est effectué (Nunnally et Bernstein, 1994; Evrard et al., 2003). A ce titre, le coefficient alpha de Cronbach (1951) est l'indicateur le plus utilisé pour mesurer la fiabilité d'une échelle.

Nous présenterons ci-dessous les résultats de l'étude de la dimensionnalité de l'échelle suivis de ceux de la fiabilité.

3.1.1 Dimensionnalité

La première étape dans l'étude de la dimensionnalité d'une échelle consiste à s'assurer que les données sont « factorisables ». Ainsi, le calcul de la matrice des corrélations avec les seuils de signification montre que les corrélations sont toutes positives et majoritairement significatives (Cf. Annexe). Cette matrice révèle également l'absence de corrélations significatives entre quelques items. A ce titre, nous pouvons souligner que les items PARK_2 et PARK_5 sont bien corrélés entre eux (0,587) et faiblement corrélées avec la plupart des autres items. Notons également que l'item PARK_7 est faiblement corrélé avec les items PARK_1 et PARK_4. Ceci nous laisse supposer que l'échelle étudiée nécessite d'être épurer. Le test de sphéricité de Bartlett permet de rejeter sans risque l'hypothèse de nullité simultanée de tous les coefficients de corrélation. Le test KMO, dont la valeur est supérieure à 0,7 (KMO=0,741), donne un résultat qui autorise la factorisation. Enfin, la diagonale de la matrice de corrélations anti-image rend compte d'indices MSA supérieurs à 0,5 (MSA

comprises entre 0,671 et 0,829). Toutes les conditions de factorisation sont remplies, nous pouvons donc conduire notre analyse factorielle.

Une ACP est lancée sur l'ensemble initial des sept items, sans préciser le nombre de facteurs demandés. Le critère de Kaiser indique l'existence de deux facteurs qui permettent de restituer 66,3% de la variance totale expliquée. Le premier facteur permet d'extraire 42% de cette variance, alors que le second facteur permet d'en extraire 24,3%. Le troisième facteur qui n'extrait que 10,5% est exclu par application du critère de Kaiser (Cf. tableau 3).

L'observation du graphique des valeurs propres indique la présence de deux facteurs puisque le coude est marqué au niveau du 3ème facteur. Le test MAP de Velicer n'est pas vraiment explicite puisque le résultat de ce test selon la version 1976, indique l'existence de deux facteurs. Tandis, que l'application de la version 2000 de ce même test n'indique qu'un seul facteur (Cf. Annexe). Enfin, l'application du critère de restitution minimum confirme le résultat à deux facteurs. En effet, le seuil minimum de variance totale expliquée est atteint si on prend en compte le premier et le second facteur (Cf. tableau3).

Tableau 3 : Valeurs propres et % de variance expliquée relatives à l'échelle 'Partage des connaissances'

Composante	Valeurs propres initiales		
	Total	% de variance	% cumulés
1	**2,870**	**42,033**	**42,033**
2	**1,658**	**24,278**	**66,311**
3	0,717	10,506	76,817
4	0,546	7,991	84,808
5	0,465	6,804	91,612
6	0,288	4,223	95,835
7	0,284	4,165	100,000

La majorité des méthodes déployées afin de déterminer le nombre de facteurs à retenir convergent vers une solution bidimensionnelle. Or, telle que cette échelle a été opérationnalisée, nous nous attendions à ce qu'elle soit unidimensionnelle. Le tableau suivant récapitule les résultats issus de l'application des différentes méthodes utilisées.

Tableau 4 : Choix du nombre de dimensions à retenir pour l'échelle 'Partage des connaissances'

Méthode	Nombre de dimensions à retenir
- Critère de Kaiser	2
- Test de Cattell	2
- Test MAP de Velicer (1976)	2
- Test MAP de Velicer (2000)	1
- Seuil de restitution minimum	2

En nous basant sur le critère des communalités, l'item PARK_7 est candidat à suppression car sa communalité est inférieure à 0,4 (Cf. tableau 5).

Tableau 5 : Communalités de l'échelle 'Partage des connaissances'

	Communalités
PARK_1	0,515
PARK_2	0,664
PARK_3	0,794
PARK_4	0,731
PARK_5	0,861
PARK_6	0,494
PARK_7	**0,329**

Nous supprimons l'item PARK_7 et relançons l'analyse. Ainsi, toutes les corrélations sont positives et majoritairement significatives. Le test de sphéricité de Bartlett et le test KMO autorisent la factorisation. Enfin, les indices MSA sont tous supérieurs à 0,5 (MSA comprises entre 0,588 et 0,850). Le critère de Kaiser indique toujours l'existence de deux facteurs qui permettent d'extraire 72,3% de la variance totale expliquée. Le premier facteur permet d'extraire 45% de cette variance, alors que le second facteur permet d'en extraire 27,3% (Cf. tableau 6). Ce pourcentage s'est donc amélioré après suppression de l'item n°7. Le test de Cattell, quant à lui, devient plus clair et indique également la présence de deux facteurs. Le coude est maintenant bien marqué au niveau du 3ème facteur. Nous remarquons aussi que les quatre autres valeurs propres sont à peu près alignées (Cf. Annexe).

En revanche, le test MAP de Velicer (versions 1976 et 2000), désigné dans la littérature comme étant le plus robuste, indique l'existence d'un unique facteur. Le minimum de la somme des corrélations résiduelles élevées au carré est atteint pour un seul facteur (Cf. Annexe). Enfin, pour le dernier critère appliqué qui concerne le seuil de restitution minimum, celui-ci indique l'existence de deux facteurs (Cf. tableau 6).

Tableau 6 : Valeurs propres et % de variance expliquée relatives à l'échelle 'Partage des connaissances', après 1ère purification

Composante	**Valeurs propres initiales**		
	Total	**% de variance**	**% cumulés**
1	**2,686**	**44,982**	**44,982**
2	**1,631**	**27,322**	**72,305**
3	0,546	9,149	81,453
4	0,488	8,168	89,621
5	0,334	5,593	95,215
6	0,286	4,785	100,000

Le résultat des méthodes utilisées afin de déterminer le nombre de facteurs à retenir est contradictoire. Nous notons que trois méthodes parmi les cinq utilisées indiquent l'existence de deux facteurs. Nous allons opter provisoirement pour cette solution en attendant d'examiner les communalités et la structure factorielle de l'échelle en question (Cf. tableau 7).

Tableau 7 : Choix du nombre de dimensions à retenir pour l'échelle 'Partage des connaissances', après 1ère purification

Méthode	Nombre de dimensions à retenir
- Critère de Kaiser	2
- Test de Cattell	2
- Test MAP de Velicer (1976)	1
- Test MAP de Velicer (2000)	1
- Seuil de restitution minimum	2

En nous basant sur le critère des communalités, tous les items ont des communalités supérieures à 0,4 (comprises entre 0,482 et 0,909). Concernant la structure factorielle de l'échelle, nous remarquons que celle-ci n'est pas claire. Ainsi, certains items notamment PARK_3 et PARK_4 ont des corrélations supérieures à 0,4 avec les deux facteurs retenus (Cf. Annexe). Afin, d'obtenir une structure factorielle plus claire qui nous aiderait à mieux interpréter les facteurs identifiés, nous effectuons une rotation Varimax qui permet d'optimiser les corrélations de ces variables sur les deux facteurs. Après rotation, la structure factorielle de l'échelle apparaît plus clairement. Ainsi, les items PARK_3 et PARK_4 sont à présent fortement corrélés au facteur 1 (0,877 et 0,857) et faiblement corrélés au facteur 2 (0,156 et -0,004). Les items PARK_1 et PARK_6 sont aussi fortement corrélés au facteur 1 et leurs contributions factorielles sont largement supérieures à 0,5 (comprises entre 0,697 et 0,686). Tandis que les items de PARK_2 et PARK_5 sont fortement corrélés au facteur 2 et leurs contributions factorielles sont largement supérieures à 0,5 (comprises entre 0,787 et 0,952). Le tableau ci-dessous présente les résultats après rotation Varimax.

Tableau 8 : Structure factorielle de l'échelle 'Partage des connaissances', après 1ère purification et rotation Varimax

	Communalités	Facteur 1	Facteur 2
PARK_1	0,526	**0,697**	0,201
PARK_2	0,654	0,187	**0,787**
PARK_3	0,794	**0,877**	0,156
PARK_4	0,734	**0,857**	-0,004
PARK_5	0,909	0,058	**0,952**
PARK_6	0,482	**0,686**	0,109

Avant de valider cette structure factorielle à deux facteurs, il est nécessaire de pouvoir interpréter ces derniers.

- Le premier facteur réunit les quatre énoncés suivants : PARK_1 : « *Dans mon travail quotidien, je prends l'initiative de partager mes connaissances avec mes collègues* », PARK_3 : « *Je partage avec les autres des expériences et savoirs-faire professionnels utiles* », PARK_4 : « *Après avoir acquis de nouvelles connaissances utiles au travail, je les diffuse afin que les autres puissent en profiter* », et PARK_6 : *« Au travail, je diffuse mes connaissances en les partageant avec d'autres personnes* ». Ces quatre items traduisent clairement le comportement de partage des connaissances. Ce premier facteur est donc nommé 'Partage des connaissances'.
- Le deuxième facteur regroupe les deux énoncés suivants : PARK_2 : « *Je garde pour moi mon expérience professionnelle et ne la partage pas facilement* » et PARK_5 : « *Je ne parle jamais de mon expertise professionnelle aux autres sauf si ma hiérarchie me le demande* ». Ces deux items sont des items initialement inversés qui ont été introduits dans l'échelle sous forme négative afin de susciter plus de concentration de la part du répondant et d'éviter l'effet de halo au moment du remplissage du questionnaire. Avant de lancer l'ACP, les réponses concernant ces deux énoncés ont

été recodés. Or, comme résultat de l'ACP, nous remarquons que ces deux items sont isolés des quatre autres qui mesurent le partage des connaissances (facteur 1) et forment un facteur à part (facteur 2). Cela nous laisse supposer que soit les répondants ne se sont pas rendus compte de l'existence de ces deux items inversés au moment du remplissage du questionnaire et ont répondu au questionnaire de manière aléatoire ou rapide ; soit la notation attribuée par les répondants aux items PARK_1, PARK_3, PARK_4 et PARK_6 est différente de celle attribuée aux items PARK_2 et PARK_5 (nous que le premier groupe d'items exprime le partage des connaissances, alors que le deuxième, dans sa structure originale (inversée) exprime plutôt le non partage ou encore la rétention de connaissances. L'examen de plus près des statistiques descriptives relatives à ces six items ainsi que la vérification des réponses notées dans notre base de données, montrent que les répondants se sont bien rendu compte de l'existence des deux items inversés au moment du remplissage du questionnaire. Seulement, l'évaluation obtenue pour les items affirmatifs est relativement différente de celle obtenue pour les items inversés, même si les réponses vont dans le même sens (corrélations positives entre les six items). Cela signifie donc que les réponses ne sont pas tout à fait symétriques entre les items affirmatifs et les items inversés (négatifs).

Cette conclusion est très intéressante car elle permet de mettre en relief la question concernant l'intérêt de l'introduction des items inversés dans une échelle ou un questionnaire. Alors que certains auteurs conseillent l'utilisation de ce type d'items (Igalens et Roussel, 1998), d'autres ne le recommandent pas (McLaughlin, 1999), vue les problèmes que peut induire leur utilisation au niveau de la fiabilité et la validité d'un questionnaire de recherche.

Maintenant que nous avons décelé l'origine de l'existence de deux facteurs, nous décidons de supprimer le deuxième facteur, composé des deux items inversés et de ne garder que le premier facteur qui regroupe les quatre items restants et qui exprime clairement le comportement de partage des connaissances.

Nous relançons l'analyse sans les items n°2 et n°5. Ainsi, toutes les corrélations sont positives et significativement différente de zéro au seuil de risque de 5%. Le test de sphéricité de Bartlett et le test KMO autorisent la factorisation. Enfin, les indices MSA sont tous supérieurs à 0,5 (MSA comprises entre 0,705 et 0,826). Le critère de Kaiser indique maintenant l'existence d'un seul facteur, qui permet d'extraire 65% de la variance totale expliquée. Le test de Cattell indique également la présence d'un seul facteur (le coude se situe au niveau du 2ème facteur). Enfin, le test MAP de Velicer ainsi que le critère de restitution minimum viennent conforter la solution à un seul facteur (Cf. tableau 9, et Annexe).

Tableau 9 : Valeurs propres et % de variance expliquée relatives à l'échelle 'Partage des connaissances' après 2ème purification

Composante	Valeurs propres initiales		
	Total	**% de variance**	**% cumulés**
1	**2,197**	**64,975**	**64,975**
2	0,559	16,525	81,501
3	0,334	9,893	91,393
4	0,291	8,607	100,000

Tous les critères utilisés convergent donc vers une solution à un seul facteur (Cf. tableau 10).

Tableau 10 : Choix du nombre de dimensions à retenir pour l'échelle 'Partage des connaissances' après 2ème purification

Méthode	Nombre de dimensions à retenir
- Critère de Kaiser	1
- Test de Cattell	1
- Test MAP de Velicer (1976)	1
- Test MAP de Velicer (2000)	1
- Seuil de restitution minimum	1

Les quatre items sont bien représentés sur le facteur retenu. En effet, les communalités dépassent toutes 0,4 (comprises entre 0,487 et 0,793). Aussi, les contributions factorielles sont nettement supérieures à 0,5 (comprises entre 0,698 et 0,891). Le tableau ci-dessous reprend les communalités et la structure factorielle finale liées à cette échelle.

Tableau 11 : Communalités et structure factorielle de l'échelle 'Partage des connaissances' après 2ème purification

	Communalités	Facteur 1
PARK_1	0,530	0,728
PARK_3	0,793	0,891
PARK_4	0,707	0,841
PARK_6	0,487	0,698

L'analyse exploratoire opérée sur l'échelle 'Partage des connaissances' indique que celle-ci est unidimensionnelle. Cette première analyse a permis d'épurer l'échelle en question de trois énoncés, PARK_2, PARK_5 et PARK_7. Elle a également permis de soulever une question importante qui concerne l'introduction des items inversés. La nouvelle structure factorielle à quatre items sera réexaminée dans le cadre d'une analyse confirmatoire.

3.1.2 Fiabilité

L'analyse de la fiabilité montre que le degré de consistance interne de l'échelle de mesure 'Partage des connaissances' est de 0,805. Le score de l'alpha de Cronbach est d'un niveau satisfaisant et reflète une bonne consistance interne. Les quatre items de notre échelle contribuent tous à la fiabilité de celle-ci.

3.2 Analyse factorielle confirmatoire

L'analyse factorielle confirmatoire (l'AFC est réalisée sous le logiciel AMOS) se situe dans le prolongement de l'analyse factorielle exploratoire (AFE). L'AFC confronte aux données empiriques les hypothèses relatives à la structure des relations entre les variables observées et les variables latentes. Dans l'AFC, les liens entre telle variable observée et telle variable latente sont définis *a priori* par le chercheur (Gerbing et Hamilton, 1996 ; Roussel et al., 2002). Elle confirme donc les différents modèles de mesure issus de l'AFE (Roussel et al., 2002).

Par ailleurs, afin de mettre en œuvre l'AFC, trois critères doivent être étudiés (Roussel et al., 2002). Il s'agit du degré d'ajustement du modèle de mesure, de la fiabilité et de la validité du construit. Ainsi, afin de mesurer la qualité de l'ajustement du modèle de mesure, trois familles d'indices sont pris en compte. Il s'agit des indices absolus, des indices « incrémentaux » et des indices de parcimonie. Les

indices d'ajustement absolus permettent d'évaluer dans quelle mesure le modèle théorique posé a priori reproduit correctement les données collectées (Roussel, 2002). Ici, nous utiliserons les trois indices suivants : GFI (Goodness of Fit), AGFI (Adjusted Goodness of Fit) et RMSEA (Root Mean Square Error of Approximation). Les Indices « incrémentaux » mesurent « l'amélioration de l'ajustement en comparant le modèle testé à un modèle plus restrictif, dit 'modèle de base'. Le modèle de base le plus couramment utilisé est le 'modèle nul' ou 'modèle indépendant' (Bentler et Bonett, 1980). Il s'agit d'un modèle pour lequel toutes les variables observées seraient non corrélées, c'est à dire qu'aucune relation structurelle entre les variables n'est supposée ». Ici, nous utiliserons les deux indices incrémentaux : NFI (Normed Fit Index) et CFI (Comparative Fit Index). Enfin, les indices de parcimonie ont pour objectif d'éviter de surestimer un modèle donné, de détecter si le mauvais degré d'ajustement d'un modèle provient d'une sous-estimation du modèle testé et de déterminer, parmi plusieurs modèles plausibles équivalents, celui qui présente la meilleure parcimonie et qui devrait, par conséquent, être préféré aux autres (Roussel et al., 2002). Ici, nous utiliserons l'indice de parcimonie : χ^2 normé (χ^2/ddl).

Par ailleurs, la fiabilité est mesurée par le coefficient rhô de Jöreskog. Le rhô de Jöreskog est préféré à l'alpha de Cronbach, d'une part parce que ce coefficient est moins sensible au nombre d'items d'une échelle, et d'autres part parce que celui-ci intègre les termes d'erreur dans son calcul (Gerbing et Anderson, 1988). La validité, quant à elle, est appréhendée par la validité convergente. La validité convergente consiste à vérifier si les indicateurs qui sont supposés mesurer le même phénomène, sont fortement corrélés entre eux (Evrard et al., 2003 ; Pittenger, 2003; Malhotra, 2004; Jolibert et Jourdan, 2006). Un construit montre une bonne validité convergente lorsque le test t associé à chacune des contributions factorielles est significatif, c'est à dire supérieur à 1,96 (Roussel et al., 2002). Cette validité est forte si la variance moyenne extraite (rhô de validité convergente, ρ_{vc}) est supérieure à 0,5 (Fornell et Larcker, 1981).

3.2.1 Ajustement du modèle de mesure

L'étude de l'ajustement du modèle de mesure montre que tous les indices absolus, incrémentaux et de parcimonie respectent les normes de bon ajustement les plus communément utilisées. Le modèle assure donc une bonne représentation des données empiriques (Cf. tableau 12).

Tableau 12 : Indices d'ajustement du modèle de mesure relatif à l'échelle 'Partage des connaissances'

	χ2	ddl	χ2/ddl	GFI	AGFI	RMSEA	NFI	CFI
PARK	6,72	2	3,36	0,99	0,94	0,091	0,98	0,99

L'échelle 'Partage des connaissances' est unidimensionnelle et comprend quatre items qui sont fortement corrélés à la variable latente. Tous les coefficients de régression standardisés sont supérieurs au seuil fixé de 0,4 (compris entre 0,656 et 0,855). Aussi, tous les T associés aux contributions factorielles sont nettement supérieurs à 1,96 (Cf. tableau 13 et Annexe). Enfin, aucun résidu standardisé n'est supérieur à 2,58 et aucun indice de modification n'est suggéré (Cf. Annexe).

Tableau 13 : Analyse factorielle confirmatoire de l'échelle 'Partage des connaissances'

Item	Coefficients de régression standardisés	C.R	P	Coefficients de corrélation multiple
PARK_1	0,656	9,786	***	0,431
PARK_3	0,702			0,493
PARK_4	0,706	10,395	***	0,499
PARK_6	0,855	11,035	***	0,732

La figure suivante reprend le modèle de mesure relatif à la variable latente 'Partage des connaissances'.

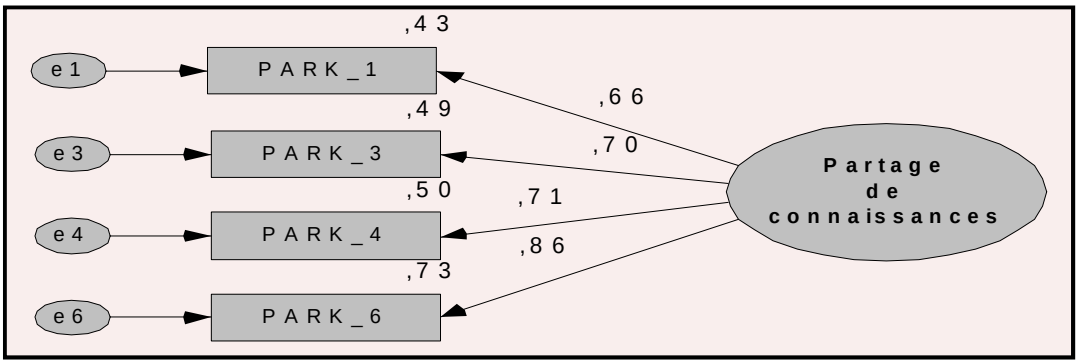

Fig. 2 Modèle de mesure relatif à la variable 'Partage des connaissances'

3.2.2 Fiabilité

Pour cette échelle, nous obtenons un ρ de Jöreskog qui reflète une cohérence interne du construit, satisfaisante (ρ = 0,822). Nous remarquons que cette valeur est proche du score obtenu pour l'alpha de Cronbach.

3.2.3 Validité convergente

L'échelle atteste d'une validité convergente correcte puisque d'une part, le test t associé à chacune des contributions factorielles est significatif, c'est à dire supérieur à 1,96 et d'autre part, la variance moyenne extraite (rhô de validité convergente) a une valeur supérieure à 0,5 (ρ_{vc} = 0,538).

4. Discussion et conclusion

L'échelle 'Partage des connaissances' est adaptée du travail de Lu et al. (2006). Elle est initialement composée de sept items et elle a été retestée, à notre connaissance, pour la première fois. L'épuration de cette échelle a permis d'aboutir à une structure factorielle définitive composée de quatre items. Les analyses exploratoires et confirmatoires montrent que cette échelle est unidimensionnelle. Celle-ci présente également des caractéristiques psychométriques satisfaisantes et donc est valide et fiable.

Cependant, il faut rappeler que lors de l'épuration de l'échelle, nous avons soulevé le problème concernant l'intérêt des items inversés (PARK_2 et PARK_5), figurant dans l'échelle. Nous rappelons que l'introduction d'un item inversé dans une échelle de mesure a pour objectif de susciter plus de concentration de la part du répondant et d'éviter l'effet de halo au moment du remplissage du questionnaire. Le résultat auquel nous avons abouti montre que les répondants ont pris conscience de l'existence des items inversés dans le questionnaire (effet souhaité). Toutefois, ces derniers ont attribué une notation différente aux items affirmatifs et aux items négatifs (une notation non symétrique). Cette différence, même si elle n'est pas très importante, a suffit pour que ces deux items soient éliminés de notre échelle (effet non souhaité).

Ceci dit, conformément aux recommandations de McLaughlin (1999), l'échelle de mesure 'Partage des connaissances' devrait être retestée sans les deux items inversés (soit en les réécrivant sous une forme affirmative, soit en les supprimant de la liste des items composant l'échelle). Le résultat obtenu concernant la validité et la fiabilité de l'échelle doit être comparé à celui auquel nous avons abouti, dans le cadre du présent travail de recherche (où les deux items inversés sont pris en compte). Cette comparaison permettra d'une part, d'apporter un élément de réponse au débat concernant l'introduction des items inversés dans un questionnaire de recherche et leur impact quant à la validité

et la fiabilité de cet instrument de mesure (Igalens et Roussel, 1998 ; McLaughlin, 1999) et d'autre part, de décider avec certitude de la conservation ou de l'élimination des deux items de l'échelle 'Partage des connaissances', dans le cadre des futures recherches.

Abstract

The article presents marketing justification of a project on introducing the innovative information product MedKid to the market intended for use by medical staff of Tomsk preschool childcare institutions. The article includes results of complex marketing research: elements of market analysis and its segmentation; study of microenvironments' development trends; study of consumer needs on the basis of source information collected via expert interviewing; analysis of competitive conditions in the field on the basis of M. Porter's techniques and definition of a future product competitiveness; identification of strengths and weaknesses of a marketing proposal developed by company-manufacturer UMSSoft on the basis of SNW-analysis.

Keywords*:* software product, cloud service, marketing justification of a project, market research.

Introduction

Selevich et al (2015) mentioned that social institutions use marketing techniques increasingly. The crisis in the economy are the cause of this. Nowadays there is a number of management models used in medical organizations. However, the state of administration in medicine still remains unsatisfactory. Today one of crucial tasks in the Russian medicine is the organization of continuous data collection and storage to ensure proper health of the population with the focus on filling patients' medical records since the first days of their life. The cost for organizing such processes constitutes significant and constantly increasing part of the medical institutions' budget, which by different estimations can make from 10 to 33% of their total budget, according to UMS Company (2012). In order to reduce such costs specially developed medical information systems, which allow quick information processing and transfer are used thus increasing management efficiency.

Since 2013 UMSSoft Company has initiated the preparation for implementation of a start-up on creation and sale of a new information product for medical use on the market of preschool childcare institutions. Program complex MedKid implies automation of work of a doctor, nurse and deputy manager on economic affairs of a kindergarten. The decision shall be supplied through SaaS model (software as a service) and shall ensure high capacity.

When writing a business-plan one of its key items was marketing justification of a project MedKid. It contributes to deeper understanding of an organization's external environment functioning mechanisms, adjustment of marketing proposal to market features and hence increasing chances of an organization for commercial success. This justification based on the results of complex market research. It allows the company not only to prove its potential for entering the market with the innovative product but also to correct the marketing proposal taking into account the features of the external environment.

The methodology of this approach with the marketing project justification should include:
1. Analysis of the macro-environment (PESTLE analysis and Porters' 5 competitive forces analysis in the industry).
2. Analysis of the microenvironment (competitor analysis, an assess of the product competitiveness, SNW-analysis, scan of consumers and their needs).

This approach allows assessing the attractiveness of the company's external environment, seeing its threats and opportunities, as well as the strengths and weaknesses of the company. This is usually done in the form SWOT-analysis. In addition, the company has a chance to adapt and improve their marketing proposal at the initial project stage, without spending a quantity of resources at the same time.

Market analysis of MedKid product

As of 2012 the total amount of the Russian market of information technologies has made approximately 620 bln. rubles. The sales volume of software products inside the country has reached 120 bln. rubles, and services – 150 bln. rubles. According to various estimates in 2012 the total growth of the information varied from 3.9 to 6 % against the previous year results, thus the growth of hardware part of this market exceeded 10 percent.

By 2017 it is planned to finish the transition of governmental institutions to electronic document control that will provide a breakthrough to further increase of informatization level of governmental and corporate sectors of the Russian economyб according to 'Iteranet' IT Journal (2016). It is possible to say that the information industry in Russia is in the condition of a constrained growth. In highly specialized market niche of preschool childcare institutions only now we can identify players with offers for automation processes in kindergartens.

PEST-analysis which is often used to estimate key market tendencies of an industry was used to analyze macroenvironment factors and tendencies of market development. PEST-analysis is a tool of long-term strategic planning and is designed for some years upfront with annual data update.

PEST-analysis made for MedKid service demonstrates that political factors (P) produce positive impact on the company developing the given software product as there is gradual decrease in corruption level and stimulation of information processes in municipal organizations by officials.
Social factors (S). These days the birth rate exceeds the death rate thus overloading preschool childcare institutions, which makes MedKid product currently important since the developed software will allow to decrease the workload of kindergarten employees. Moreover, 53% of children living in the Russian Federation have poor health, which also contributes to service popularization as its main task is to keep medical records of a child, according to RG.ru (2011). Gribczova J. (2013) confirms that part of parents' money spent on a child remains constant (on average 20–30%), which also provides an advantage for software as the program complex implies additional functions for parents for extra payment.

High level of technologies enables to make service readily available. Moreover, the legislation of the Russian Federation promotes development of small IT-companies by reducing taxes on insurance payments from 34% to 14%, according to Ministry of Telecom and Mass Communications of the Russian Federation (2016). However, economic factors, namely stagnation of the RF economy or social factors (resistance of the senior generation to informatization), can slow down the process of software product distribution. In fact, different formats and standards in various software development companies may cause problems of report (statistics) delivery in an electronic format to state authorities due to its incompatibility.

When analyzing competitive conditions on the market, Michael Porter's approach was used. In a research study by Porter (2008) there are five driving forces on the market that define potential profit level on the market, i.e. industry attractiveness. Such forces include the level of competition within the industry, threat of occurrence of new players, market power of consumers, market power of suppliers, threat of appearance of alternative products.

The level of every factor can be estimated on a scale from low to high by its decomposition into factors of smaller order. Table 1 shows final results of the analysis.

Table 1. Results of five forces analysis

Competitive force	Level	Description	Focus area
1. Threat from alternative products	Average	Alternative products are present on the Russian market, but only have appeared.	Support and improve uniqueness of the product.
2. Threat of interindustry competition	Average	There is a small amount of players which appeared rather recently in a considered segment are present on the Russian market. Their products differ functionally. Rate of market growth is rather high due to overpopulation of kindergartens that in its turn leads to establishment of new preschool childcare institutions; moreover, there is an opportunity of price increase, however only within the limits of covering the growth of costs.	Conduct steady monitoring of competitors' offers. Develop product uniqueness and raise perceived value of the product. Reduce influence of price competition on sales. Increase the level of knowledge about the product.
3. Threat from new players	Average	As the economy of scale in the given segment is significant, there are some strong players on the market; moreover, there are micro-niches on the market that can be occupied. The return on investment when entering the industry will make approximately one year, thus large players will not reduce their prices. Access to distribution channels is completely open. Moreover, the state does not impose any limiting actions.	Conduct steady monitoring of new companies' occurrence. Perform actions aimed at continuous contact between a consumer and a company. Increase the level of knowledge about the product.
4. Threat of losing potential clients	Average	Among buyers the sales volume is distributed uniformly. Change of a client to other products is only possible in case of significant difference in price. Consumers have an interest in purchasing the product, but the interest is not high enough yet.	Increase the quality of the product on lagging behind parameters. Develop special offers for "sensitive" clients.
5. Threat of suppliers' instability	Low	There is a wide choice of suppliers, there is no restriction in volumes, in case of changing the supplier the company will bear low costs.	Hold negotiations on price reduction

During market segmentation it was defined that the basic potential consumers of the developed software product are preschool childcare institutions. Preschool childcare institution is a type of educational establishment in the Russian Federation, which ensures general educational program of preschool education with a different focus. Preschool educational institution provides education, training, supervision, care and health of children at the age from two months to seven years.
Classification of kindergartens is presented in Figure 1.

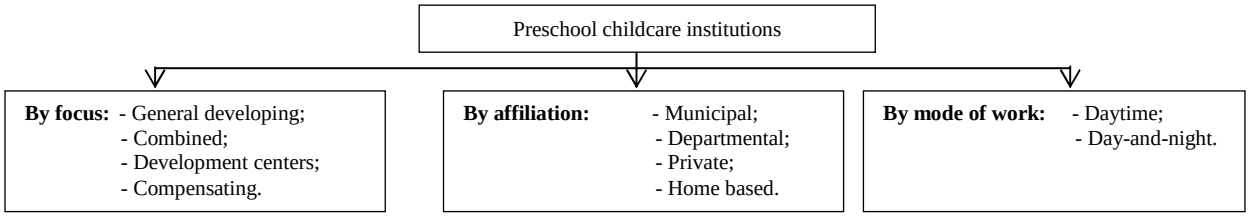

Fig. 1. Classification of kindergartens in Russia

Quantitative and qualitative structure of Tomsk preschool childcare institutions is shown in Figure 2.

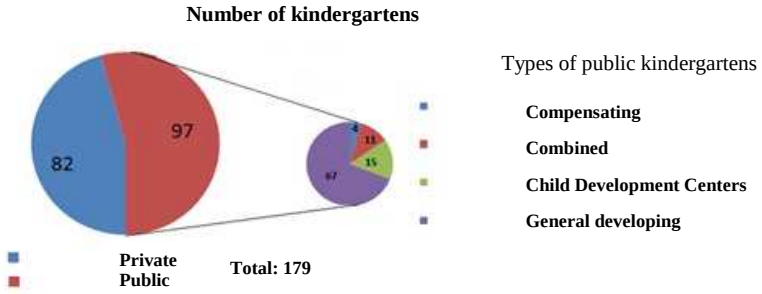

Fig. 2. Segmentation of kindergartens in Tomsk

Special distinctions between state and private kindergartens are not revealed besides the cost of service, quality of rendered services and territorial capacity.

Further an attempt to calculate the volume and nature of demand for automation services (segment capacity) of kindergartens in Tomsk was made. Today the total number of kindergartens in Tomsk amounts to 179 (82 private and 97 governmental). Taking into account the fact that the cost of service delivered by the company is 1.000 rubles a month, if connecting all kindergartens to the service the sum per year will make 179 * 1.000 * 12 = 2.148.000 (two million one hundred forty eight thousand) rubles.

This is the size of a potential gain. If we consider that when questioning the consumers they indicated the sum of 1.000 rubles as acceptable, it is possible to draw a conclusion that at present the given amount of 2.148.000 approximately reflects the market capacity. Nevertheless, it is necessary to specify the limiting sum of purchase of a client, as well as the number of preschool childcare institutions not willing to use such services. It will allow to correct the numbers on market capacity.
Seasonal prevalence of demand is demonstrated by increase, reduction or complete termination of work during certain periods of the year. Usually from September to May-June kindergartens work according to the established schedule. But in July and August the schedule often changes, and the institution may even be closed for that period. During these months the kindergartens staff usually has vacation since the number of children coming to a kindergarten is considerably reduced. Thus, the activity of preschool childcare institutions has strong seasonal nature that will impose some restrictions on MedKid sales.

Study of MedKid competitors and its competitiveness

At studying of competitors it was found out that the most probable and potentially dangerous competitor for today for service MedKid is the product "Smiles. Kindergartens". Having conducted preliminary researches from secondary sources, table 2 has been made.

Table 2. Comparison of presence of software products' basic characteristics

Functional features of a product	MEDKid	Smiles
Build statistics of preschool educational institutions	+	+
Issue electronic medical certificates to parents	+	+
Keep records of medicines	+	+
Make requests for medicines and vaccines	+	+
Conduct electronic medical records	+	+
Vaccination records	+	+
Keep certification log-books	+	-
Parental control	+	+

Attendance monitoring	+	+
Web site as a gift	+	+
Use of cloud technologies	+	+
Product sale as a service	+	-
Product sale as a license	-	+

According to Table 2 the Smiles Company is the closest competitor within a spectrum of services. However, their basic profile is aimed at attendance of children and parental control, moreover, every module of their product is sold separately. Whereas MedKid is more aimed at a medical part and provides full access to all functions for insignificant monthly payment.

Use of competitive intelligence methods (telephone interviews and results of electronic correspondence) allowed to reveal the fact that the software product and pricing of the competitor are only in their presales stage. But it is possible to say that their product will be much more expensive as they sell their software by modules, and moreover, without installation of basic modules needed to ensure proper operation of the required modules.

For the analysis of MedKid product competitiveness the target audience was identified. It comprised of nurses, teachers and managers of kindergartens, whose inquiry includes availability of software functions capable to provide high speed of employees' work at minimum expenses and resources. Further the circle of priority competitors was selected. After that the factors of software competitiveness were developed: software quality, functionality, price, service (support), market promotion, company's experience.

Competitive intelligence methods, potential consumer survey and analysis of secondary information were used to collect the necessary data. Factors of competitiveness have different weight, which was defined via opinion poll of consumers, experts and company workers. Promotion, price, quality and functionality have the greatest rate of importance for the client.

After that all factors were decomposed. Estimation of functionality included availability of necessary functions for the user, resource requirement for further use. Clarity and simplicity of software application, stability to defects (reliability), completeness, and response rate were considered during quality analysis. The parameter "price" was analyzed according to product cost, payment method, and availability of discounts. Service was estimated in terms of a service rate, completeness of documentation, support. Promotion was analyzed according to availability of advertising, width of dealer network, participation in exhibitions. Experience of a seller was estimated against implementation in other establishments and existence period of a company. All the above mentioned followed the comparison of microindicators by transferring quantitative and qualitative estimates into points (5-point scale was used). As a result factors of competitiveness (Table 3) were estimated.

Table 3. Comparison of objects against factors of competitiveness

Factors of competitiveness	Relevance coefficient	MedKid	MedKid with $K_{relevance}$	Smiles	Smiles with $K_{relevance}$	Leader
1 Functionality	0,19	5	0,95	5	0,95	no
2 Quality	0,19	4	0,76	3	0,57	MedKid
3 Price	0,21	5	1,05	4	0,84	MedKid
4 Service	0,15	4	0,6	5	0,75	Smiles
5 Promotion	0,21	4	0,84	3	0,63	MedKid
6 Experience	0,05	5	0,25	5	0,25	no
Total (market position)	1	27	4,45	25	3,99	MedKid

Then MedKid competitiveness with relation to primary competitor – Smiles was calculated

considering that at competitiveness > 1 the object is more competitive.
Competitiveness with correction factor of relevance = 4.45 / 3.74 = 1.12 (1)

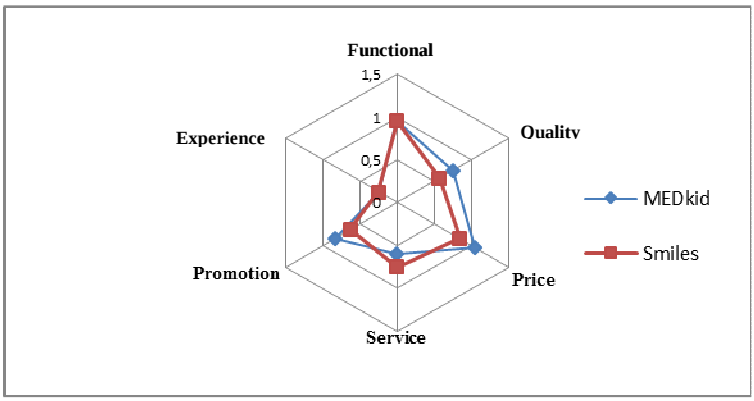

Fig. 3. Polygon adjusted to weighting coefficient

Then, the results of competitiveness were visualized (Figure 3). The given diagrams contribute to further understanding of competitive advantages and disadvantages of MedKid projects and its competitor. With relation to other players, MedKid has strong positions in terms of price, quality and promotion, but concedes in service.

Study of consumer needs

The purpose of research was to create deep understanding of potential consumers' needs that will form a basis for adaptation if software product functions for document circulation in preschool childcare institutions. The basic target audience included managers, nurses and teachers of preschool childcare institutions.

The basic method of research was questioning of kindergarten workers through interviews with rigid and soft questions. Copies of accounting log-books given to interviewers were used as the secondary data for research. At the beginning of research the information on the quantity of necessary documentation to conduct the activity of nurses at preschool childcare institutions was collected. After that, the log-books were split into categories against answers of respondents to the following question: "Which log-books do you use at work and how often?" On the basis of responses received from kindergarten employees it was decided to break all log-books according to frequency of their use into three relative categories. Besides, the asterisk indicates those log-books and forms which should be included into program complex first of all due to certain interrelation between them, which shall be considered in software product development.

Types of log-books are grouped by frequency of use by employees of preschool childcare institutions. The classification allowed not only to develop the structure and operating procedure of a new software but also to carry out detailed study of the working process of a medical employee in a kindergarten.

After interviewing the kindergarten workers the basic problems which were later transferred into the list of tasks were selected and analyzed. Results of respondents showed that nurses, as a rule, carry out duties of several employees, simultaneously combining several positions. Moreover, functions of nurses include not only filling medical records of a child but also daily record keeping of various documents and log-books. This information should be compiled into statistical data necessary for nurses and managers of kindergartens. Additionally, it is possible to display data presenting certain interest for children's parents (by creating "parental control" function). It generates the need of expanding software functions on the basis of planned schedule since dates are an important component of work of preschool childcare institutions in general.

The software should simplify and reduce time efforts for such routine processes as attendance monitoring; planning of medical measures (medical inspections, preventive vaccinations); entering data into medical records of a child; keeping nutrition log-book. Moreover, the system should ensure the possibility of entering medical data of a patient into electronic medical records by any authorized person (doctors, parents, etc.). Every user may receive authorization to perform operations within the limits of electronic medical records of a child for a limited period of time. Besides, the results of research affected the definition of marketing tactics and strategy aimed at popularization of the service in the Russian market and, as a consequence, further monetization of a product.

Analysis of the environment is one of the parts of a marketing justification of a project. It allows to determine how the innovative product will be valuable for the target audience, and hence calculate the potential demand. And we can also discover what opportunities and threats are in the external environment, which will allow to adjust the company's market strategy. The presented approach is consistent with the general practice of project management in the business environment (as described, for example, in the article by Sirazitdinova et al (2015)). However, social services (kindergartens, schools, medical institutions) in Russia is not yet learned to apply such research tools in their business practices.

Abstract

The adaptive nature of the dynamic competences is one of the most debated issues in the Russian education system. Communicative component, the ability to generate new knowledge, the ability to learn teaching methods are the basis for the formation of the projected results of the higher education management in practice-oriented pedagogical process.

***Keywords*:** knowledge economy, dynamic competences, higher education management, innovative model of higher education.

1. Introduction

In modern society - a knowledge society - the rates of producing and consuming information have significantly increased. The same situation is observed in the science and education sphere: "... in 2013, there has begun the growth of Russian researchers' publications in the world's scientific journals. In 2013-2014, this rate was 2.11%, at the beginning of 2016 this value is - 2.28%. In absolute indexes, the number of Russian researchers' articles is growing steadily. Thus, in 2013 the number of peer-reviewed articles was 29,010 units, in 2014 - 30,044 units, in 2015 - 31,542 units" (according to the website of Ministry of Education of the Russian Federation, as well as the materials of the collection "Science and education statistics"). This may result in the processes of generating, storing, and transferring of knowledge will soon undergo significant changes. In the education system, it can be expressed in the following: the knowledge students receive for 4 (bachelor course) or 2 (master course) years at the time of graduating will lose its relevance. In such circumstances, the productivity of professional activity depends neither on the possession of any kind that has been once and for all given nor specific information but on the ability to navigate in the information flows, initiative, ability to cope with problems, find and use the missing knowledge or other resources to achieve this goal (Teece D. J., Pisano G. A. Shuen A., 1997). And therefore the competence set of the future professional should include such competencies that can neutralize this rapid obsolescence of knowledge and will successfully be included in social and professional activities. "The dynamics of changes in the economics, science, production leads to the rapid obsolescence of knowledge, depreciation of certain skills, so along with the generated competence for employers, the assessment of the potential employee opportunities to learn new knowledge and to develop new skills becomes very important" (Klimenko T. V., 2010, p. 98). In this paper, the author gives the definition of companies' dynamic competences, which, at a certain adjustment, can be used in characterizing the dynamic competence of the individual (student): the ability of purposeful creation, expansion and modernization of own knowledge and skills in response to changes in environmental conditions (Klimenko T. V., 2010).

2. The goal

In other words the professional implementation of Master program by the graduate (his social and professional adaptation) is largely determined to the successful development of dynamic competences in the learning process.

3. The concept of dynamic competencies

The necessity of dynamic competencies formation can be caused by several reasons:

1) the increase of graduates competitiveness. Formation of dynamic competences that meet the needs of potential employers and the labor market, will give a definite competitive advantage due to characteristics such as flexibility and adaptability;
2) the compensation for time spent on obtaining a diploma of professional education (obsolescence of professional knowledge during studying at the university) with an effective mechanism of adaptation to the changing workspace;
3) the using of modern educational technologies, development of interdisciplinary connections, the effect of self-studying and co-studying, the availability of different educational programs, etc. - All these, and not just these, factors turn the necessity to the inevitability in the dynamic competencies formation .

The concept of dynamic competencies which have adaptive nature and which allow to integrate into the work space more successful, have not fully settled yet, especially in the Russian education system. We believe that a set of such adaptive components may vary and depends on many factors, such as the situation in the region's economy; the development of private business and employers' requests; political situation; the emergence of new professions and activities, etc. But, in any case, from the point of view of knowledge economy developing, the most frequent and the most perspective dynamic competencies are the following: 1) linguistic / communicative competence, communication skills. The development of this competency has a positive impact on the common development of thinking and the ability to respond adequately to any abnormal situations; 2) the ability to generate new knowledge (as knowledge tend to become obsolete very quickly, so the worker must either constantly improve his/her qualification or to learn how to generate knowledge independently - basically, this can save a lot of time and finances of the organization, on the other hand, will give a competitive advantage in the form of a new information; 3) possession of learning disability learning methodology. In many teams there is an instinctive co-studying when newcomers are attached to the masters, who tell them about the peculiarities of a work on the particular place (sharing experiences). This technique is used in the factories, the industrial enterprises, in the construction when there is no time for theoretical training and it is much easier to attach the young employee to an experienced one, which will give this knowledge in clear and understandable form. And if to develop this ability intentionally (the ability to teach others to teach), the process of knowledge economy managing can has more informed and predictable character.

Moreover, the education policy of the modern educational institution is constructed in such a way that students have to learn a large amount of information on their own. This format of knowledge acquisition is laid in educational standards, as well as is dictated by reality itself, as a former graduate is often put in the position of uncertainty and forced to develop the necessary knowledge array independently on the workplace. Therefore, the developed skill of self-studying is necessary for student's successful adaptation to society (socialization) and professional environment (Allayarova, Z.S. Kalashnikova T. V., Moiseenko Y. A., 2014).

4. Dynamic competences integration

Integration of dynamic competences is quite complicated and time-consuming process, not only because of the methodology and tools of dynamic competencies formation are selected for each individual case, but also because a number of issues require constant refinement and adjustment:

1. What are the dynamic competences in this particular case for (which problem can be solved with their help).
2. What competences an employer needs? (questionnaires, surveys, interviews).
3. Whether will this increase the demand for such specialists on the labor market - a survey of potential employers?

4. Will the integration of this kind of competences to the learning process economically profitable to a university / faculty (expenses- teacher training, educational materials, technical equipment of classrooms / departments, outsourcing specialists attraction).
5. How serious will be the changes in the educational process with the orientation on these competences? Does the working out of these competencies essential at all training sessions, or it is enough to include several modules (what year?)
6. How to form these dynamic competences? Whether it is better to take already-made Western models or to try to develop a domestic methodology?
7. How can we check these competences assimilation at Masters? It is essential to have a tool for verification of the results of the dynamic competences implementation (comparison with the masters, studying the traditional program: questionnaires of themselves, a survey of employers, feedback from work colleagues, feedback from teachers about performance, the objective quality improvement of the work).

As an element that enhances the usefulness of dynamic competences there can be considered the possibility of mixed groups' formation (domestic and foreign students) in master's degree programs design. This will allow, firstly, to attract additional contingent of Russian students who are interested in getting an active language practice, and secondly, to increase the interest of foreign students (for the same reasons). There are a number of tasks to enhance the success of attracting foreign students: 1) attraction of foreign students, with an orientation of their work in our country, in our organizations. The integration of dynamic competencies will contribute to a successful adaptation of foreign graduates to the realities of the Russian labor market. 2) The variant of mixed groups - there are foreign and Russian students studying together in one groups (co-studying effect, the competitive element, language practice). 3) Searching for foreign students for a specific workplace (i.e., we find an employer who needs a foreign employee, look for a foreign student, teach, sent to the employer).

5. Conclusion

In general, it should be noted that the phenomenon of dynamic competencies in the structure of higher education is still poorly studied and requires a specific approach, taking into account the internal interests of the educational organization as well as, in general, the social and professional environment, in which the student is located and which has a significant pressure in the individual educational trajectory selection.

Abstract

The purpose of this paper is to analyze the empirical link between corporate governance and financial performance on a sample of 51 companies mostly from the technology sector and NASDAQ listed, during 2010-2013. Performance was measured using as proxy the return on assets (ROA) and the return on equity (ROE) and for the corporate governance measures there were selected variables as duality, seniority and remuneration of the CEO, size, independence and gender diversity related to Boards of Directors. As estimation techniques we used multivariate regression models, generalized least squares (GLS) and standard error correction for heteroskedasticity using White's method. The empirical results have confirmed the influence of mixed corporate governance variables on financial performance indicators at the company level. Hence, we obtained in both models a positive influence on financial performance from variables age, years listing and CEO's remuneration with bonuses.

We obtained negative influence for the variables size / independent members of the Board of Directors and for the CEO duality. The difference between the two models was marked by the positive influence of the percentage of womens in Board of Directors' members and the CEO salary on ROA. The control variables had a positive influence only on the ROE model. The Risk Commitee variable had a negative influence on ROE. The paper highlights issues related to human nature such as the lack of fear for penalty which can lead to the loss of use of rationality and morality, a fact which leads to dangerous behavior if that people have a significant decision-making power.

Keywords: corporate governance, financial performance, econometrics

JEL Classification: G32, G34

1. Introduction

The 2007's represented for the US economy, but also for the entire world, the triggering of the famous financial crises. After the Great Crash of 1929 it would have been expected that this kind of events will not be repeated anymore and the participants from the financial market will take protective measures. But human nature, greed, globalization and derivative instruments, all combined, have pulled the alarm within financial markets, leaving behind a hard lesson to forget. Kotler and Casoline (2009) believe that with the 2007s we have entered into "a new era of turbulence" in which the cyclicality has been replaced by the uncertainty (and the economic and financial environment became "chaotic").

The academic literature contains numerous papers describing the causes and effects of the 2007's crisis, but the purpose of this paper is to analyse the corporate governance for us companies that are found listed on NASDAQ market and also are components of the dow jones index.

The paper seeks to identify if and how companies have implemented corporate governance rules in the period after the crisis. Viewed from the crisis perspective, it can be said that corporate governance was ineffective, but at a closer look it can be seen that there has been a lack of attention to the rules imposed by it. Apart from the link between corporate governance and financial performance, the novelty of this research study is the attention to the idea of moral hazard and voracity for earnings without regard to corporate governance. This study is important because it highlights the meaning of

corporate governance within capital markets and its influence on the financial performance of listed companies. Another important issue followed in this paper is the research of human nature, which lose its use of reason when there is no fear of being penalized. This is a dangerous behavior if that people have a significant decision-making power (for example the CEO duality inside of a large company).

The rest of the paper is structured as follows: Section 2 presents significant works of literature aimed to the proposed topics. Section 3 contains the assumptions chosen for the econometric research. Section 4 includes the presentation of the methodology chosen to investigate the influence of corporate governance on the financial performance of the company and how it could interfere with the realationship of the shareholders - managers. Section 5 contains the results of the econometric study. The last section contains conclusions on corporate governance, results and proposals for future research.

2. Prior research about corporate governance in academic literature

Monks and Minow (2011) define the corporate governance as a tool for warning and risk prevention, used by managers in the benefit of shareholders. Such risks can also affect the community, an idea supported by Haldane (2011) who said that in the 13th century the bankers had been bankrupted banks and now they are bankrupting more than banks, referring to the 2007's crisis. Bebchuk and Fried (2003) noted, contrary to economic theory that the managers goal is not necessarily to maximize the shareholder wealth, a fact which leads to asymmetry of information. Empirical evidence obtained by Lee et al (2013) support the idea that the application of the rules of corporate governance codes can reduce the asymmetry of information. Kanagaretnam et al (2007) defined the corporate governance as the combination of procedures to ensure the protection of both the majority and the minority shareholders. To better understand this problem must start from its roots. Turner (2009) presents the Anglo-Saxon financial and banking system from the 19th century which was composed of majority stakeholders ("low concentration") and with total power control ("unlimited liability partnerships"). Being the majority shareholders they literally risked their own fortune, so they were more disciplined with the clients' deposits. This may be the reason why corporate governance has emerged so late. But Industrial Revolution and modern society were in a constantly expanding so the development of railways was needed and massive capital investments were required. Owners of banks were not willing to take the risk and they didn't allow loans. Thus, in the second half of the 19th century, the United States was the first state who adopted the so-called "limited liability" which allowed dividing the equity to a greater number of shareholders, paving the way to the actual capital markets, but the Pandora's box of financial irregularities was opened. Then it was perhaps the right moment to impose the corporate governance code but they didn't do it.

Another problem pursued is specified by the Executive Director of Financial Stability at the Bank of England, Haldane (2011) who said that in 1989 the CEO rewards of the largest US banks were 100 times higher than the average income of a household. By 2007 it had become 500 times bigger. This spectacular increase is not due to the imposition of the corporate governance but contrary, to the fact that CEOs have minimized the extent of the risk of non-compliance. The American Corporate Governance Code suggests that managers' salaries should reflect performance and seniority, but should not exceede more than one million dollars in order to be tax efficient. This situation is specific to companies deemed "too big, to fail". Haldane (2011) noted that the importance of corporate governance was belittled without taking in consideration the risk, a fact which eventually led to the crisis.

The academic literature analyzes the corporate governance from several perspectives. The main empirical studies include CEO characteristics, characteristics of the Board of Directors, the CEO remuneration and other transmission mechanisms of corporate governance within a company. The authors devoted to studies of corporate governance are Shleifer and Vishny (1997), La Porta et al (1999), Drobetz et al (2003) and others. The most of the papers have focused mainly on the characteristics of the Board of Directors. Adams and Ferreira (2007) considered as tasks of the Board the activity of monitoring the way where the company "goes". Boone et al (2007) examined this fact, based on two assumptions regarding the Board of Directors. The first assumtion considers that the

Board is often ineffective, and should be regulated in order to increase the financial performance of a company. The second scenario considers the Board of Directors as part of the company, noting that it should be structured according to company characteristics and the business environment in which it operates to achieve higher performance. Boone et al (2007) concluded that the Boards of Directors have adjusted themselves to respond effectively to the characteristics of the companies, with a dynamic management's strategy that takes into account the cost of monitoring the managers. Their companies have become more competitive and hence, more efficient by reducing the information asymmetry. Mashayekhi and Bazaz (2008) obtained a positive correlation between governance and performance and they have theorized that an effective Board of Directors can significantly reduce the cost derived from the agent problem. Beside informational asymmetry and agency costs, many authors, including Core and Larcker (2002), noted that elements of corporate governance influence the company's value. Correlating the two ideas with ownership structure and the board members who hold shares in that company, they highlighted the theory proposed by Jensen and Meckling (1976) and the bond between governance and financial performance. Armstrong et al (2015) examined the link between governance and financial performance, focusing on legal tax avoidance and on the incentives of the managers. Although initially they did not obtain a significant link between governance and tax avoidance, using quantile regressions, they have identified a positive relationship between the number of independent members of the Board of Directors and the reduced levels of tax avoidance. On the other hand, Armstrong et al (2015) have found that the use of high level of tax avoidance has a negative relation with the number of independent members. Thus, one can believe that non-executive members accept the use of legal tax avoidance in reduced conditions to get a higher financial performance, but they don't allow that these methods to be used excessively for could adversely affect the company, and hence, the shareholders. Itturalde et al (2011) obtained a nonlinear relation between ownership structure and the corporate value. The idea is supported by Erkens et al (2012) who showed that firms with Boards of Directors with more non-executive members and which were held (from number of shares) mostly by institutional investors had the worst returns during the crisis. Beekes et al (2010) showed that firms which include a large number of members in Board of Directors had a negative link between their number and the economic profitability. Al-Najjar (2013) studied the link between governance and financial performance based on three indicators: ROA (return on assets), ROE (return on equity) and Market-to-book ratio. The results showed that the role of independent members is statistically significant on both profitability indicators ROA, ROE and on the performance indicators from stock market. Al-Najjar (2013) concluded that corporate governance positively influences a company's financial performance only if it is supported by the macroeconomic conditions of the industry. The theories support the idea that corporate governance is better applied if in Board of Directors there are representatives of institutional investors. Bushee et al (2013) studied corporate governance from the perspective of institutional investors but they did not obtain clear evidence to support this theory. McCahery et al (2010) studied the issue of institutional investors for US companies and they noted that institutional investors prefer companies where corporate governance has an active connection on the financial performance. Loderer and Waelchli (2011) believed that as a company matures, the financial performance declines, especially in the technology sector which is in a continuous development. This is reflected by a lesser degree of economic rentability and a lower market share because the company can not grow more. Li and Maksmovic (2010) considered that companies from industries that can not have a maturity very high, such as the technology sector which advances continuously, the trend is to choose managers who are known for their performance in other areas, but they do not have the expertise to get a notable financial performance.

Another issue debated in academic literature is the CEO compensations. The statistics compiled for 2014 by Investor Responsibility Research Center Institute (IRRCi) for companies in the S&P 1500, showed that 90% of directors are remunerated based on the accounting results obtained in less than three years and only 12% of the remunerations were based on financial performance indicators. Thus, it is not surprised the long-term impact on financial performance of the managers' decisions. In the USA, for determining the remuneration it is taking into account the protection of shareholders' interests and the idea of maximizing their wealth. Thus, the Board of Directors must adopt a transparent remuneration policy that reflects the long-term interests of shareholders but also take into account the remuneration paid in previous years. Ozkan (2006) observed that CEOs who are overseen by a big Board of Directors with many independent members, receive higher wages, a fact which suggests that a large number of independent members is not necessarily effective in monitoring

activity. Bhagat et al (2010) concluded about the remuneration that it is not appropriate to settle the pay level according to the academic studies of the manager. Another work performed by Frydman and Jenter (2010) showed that a better observation of the impact of the CEO remuneration is through the revaluation of stocks and options' packages which are awarded to the manager. Thus, the CEO is directly involved in company and he will want to achieve a better financial performance. El Baroudy et al (2008) obtained in an econometric research that remuneration as bonuses and stock packages is closely linked with the company's size and financial performance but the basic salary is not correlated with the financial performance. Honoré et al (2015) have investigated the connection between corporate governance and financial performance in terms of the link between investments and research and development expenses made by the manager and the interests of shareholders. In other words, they analyzed the relationship governance - performance starting from asymmetry of information. Honoré et al (2015) obtained results which had showed a negative link between remuneration based on the financial performance and the shareholders' right to vote for investment in research and development. In other words, it was observed that corporate governance practices have no influence on decisions regarding the CEO's long-term investments in research and development.

Coates and Kraakman (2010) have studied the issue of tenure for the CEO post and they observed that there are certain patterns about the leading positions influenced by the degree in which the company is able to merge or be taken over by another company.

OECD published the Corporate Governance Factbook for the year 2014 which contains details about corporate governance within the OECD members. According to the report, the US is alongside Australia and the UK characterized by a dispersed ownership structure (see Holderness et al, 2010). Members of the Board of Directors are elected every three years or are re-elected annually and the number of independent members depends on the ownership structure.

Another part of the literature focuses on the existing committees within the company. They may be audit, nomination and remuneration committees. After the crisis of 2007, a new form of committee arose, the risk committee. Albring et al (2013) studied the issues regarding the committees in the context of governance - performance. Albring et al (2013) have noticed that, where are more independent members, audit committee with members who have higher expertise in financial accounting and CEO duality, companies have more financial perfomance. They also prefer to issue more new shares. Thus, a better accounting expertise provides a higher monitoring from the audit committee, yielding a higher financial performance, fact which indicates a positive influence on the part of corporate governance. Aebi et al (2012) have studied the link between governance and financial performance for companies in the banking sector. They wanted to identify how the elements of corporate governance reacted to the danger which threatened the financial performance of selected companies and even their very existence. Among the governance variables analyzed, it were counted the presence of the chief risk officer, CRO, and if he answers to the Board of Directors or to the CEO. The aim was to find the existence of a direct link between risk and financial performance. Aebi et al (2012) considered as proxy for financial performance, ROE and the returns of buy-and-hold shares and for governance structure they took the board members and the ownership structure. The study results showed that the companies, in which the CRO reports directly to the Board of Directors, recorded a higher level for ROE and yields during the crisis. The novelty of the study was the fact that the authors have shown that in the crisis context, the classical governance variables do not capture a significant impact on financial performance and it is more useful to be made variables that contain the risk element. Giannetti and Yafeh (2012) showed that the variables of corporate governance must reflect the characteristics of the credit system to capture a broader influence on financial performance. Stulz and Williamson (2003) showed that the opening level of the financial environment and the cultural level of the Board's members have influence on financial performance. Bae et al (2010) showed that the dividend distribution rate is important for studying the link between governance and performance.

Gupta et al (2013) studied the impact of corporate governance on the financial performance of US companies. The results showed that companies with a good corporate governance are not necessarily performing better, in financial terms, compared to companies that have a less developed corporate governance. Gupta et al (2013) identified three possible causes for these results. The first said that the differences in institutional development affects the impact of governance on financial

performance. The second one is based on the fact that during the crisis there has been a reduction in the informational efficiency of capital markets, which distorted the influence of governance, because each company have waited the crisis impact. How smaller companies were not confined by the restrictive conditions imposed by the Boards of Directors from the big companies, they took riskier financial decisions, but they have brought benefits reflected in better financial performance. Thus, there was a balance between companies with developed but restrictive governance and companies with a less developed corporate governance. Erkens et al (2012) have investigate the influence of corporate governance on financial performance during the crisis of 2007. They observed that firms with more independent members and more institutional investors inside the ownership structure, have recorded poor yields. This supports the idea that these governance's structures were anchored against the risk without seeking solutions to increase the financial performance, a fact which had a negative effect on performance. Another negative effect induced by the large number of independent members was the increase of indebtedness which resulted in a transfer of the shareholders' wealth to the creditors. Beltratti and Stulz (2012) observed that the Board of Directors focused only on the interests of shareholders, had a negative impact on financial performance. Ammann et al (2011) found a positive link between corporate governance and financial performance represented by the company's value. The study results showed that the proper application of the corporate governance will be reflected in higher market values. They also found that it is cheaper and more appropriate to apply corporate governance mechanisms than to implement methods for monitoring the managers, resulting in higher cash flows for shareholders and lower capital costs. Another aspect studied by the literature is the share of women in the Board of Directors. Adams and Ferreira (2009) believes that women are more prone to join the monitoring committee of the company. Khan and Vieito (2013) showed that companies with women as CEO, have took less risky decisions and thus, the financial performance, measured by ROA, was higher.

3. The assumptions chosen for the empirical research

The main aim of the research is the connection between corporate governance and financial performance for the NASDAQ listed companies in the technology sector. Starting from the models shown in the literature, we have established the following assumptions for empirical research:

▪ Hypothesis 1 (H_1): The existence of a positive link between the the share of women in the Board of Directors and financial performance (Fidanoski et al, 2013)

▪ Hypothesis 2 (H_2): The existence of a negative link between the number of non-executive members (independent) and financial performance (Erkens et al, 2012; Guest, 2008; Metrick and Ishii, 2002; Hermalin and Weisbach 2003)

▪ Hypothesis 3 (H_3): The existence of a positive link between the CEO's remuneration and financial performance (Kang et al, 2006; Perry, 2000)

▪ Hypothesis 4 (H_4): The existence of a negative link between the CEO's duality and financial performance (Erkens et al, 2012)

▪ Hypothesis 5 (H_5): The existence of a positive link between the size of Board and financial performance (Al Najjar, 2013; Adams and Merhan, 2005)

▪ Hypothesis 6 (H_6): The existence of a negative connection between the CEO's tenure and financial performance (Berger et al, 2014)

▪ Hypothesis (H_7): The existence of a positive link between the presence of the risk committee and financial performance

▪ Hypothesis 8 (H_8): The existence of a link between the year of listing on the stock market and financial performance

4. Econometric research metodology

4.1 Database and variables' description

The empirical analysis is to identify the existence of a correlation between financial positions of NASDAQ listed companies and corporate governance. Another topic of interest is the extent to which CEOs of the most powerful US companies follow the Governance Code and the rules of corporate governance. The period under review covers the 2010-2013 representing post 2007's crisis when governance has become a necessity. Although it is a relatively large difference between the crisis triggering year and the analyzed period, this difference is not random. We considered that the 2010 was the first year in which companies should start normal operation after the tumult of the crisis. The purpose was to analyze the CEO's reaction on corporate governance and what measures they took to avoid another crisises. The sample analyzed comprises 51 companies, of which 27 companies belong to the Dow Jones and 24 to NASDAQ (chosen at random), aiming to relatively equal proportions. As a result of this, we registered a total of 205 statistical observations. The selected companies are majority from the technology sector, except companies like McDonald's and Coca Cola which we retained in analysis due to their significant importance. The contagion effect of volatility within capital markets, and the fact that many investors have diversified portfolios made us to keep those companies. We excluded the financial companies like Goldman Sachs, JP Morgan and Visa.

The data source is the annual accounts statements available on Thomson Reuters Eikon' platform, as well as the reports that include ownership structure, and other information necessary to achieve corporate governance variables. We also used the websites of companies to establish corporate governance variables.

The description of the variables used in the empirical study is presented in Table 1.

Table 1. Description of variables used

Variables	Description variables
1.Dependent variables – Financial Performance	
ROA (%)	Net Income / Total Asset The economic return, ROA express the ability of the CEO to generate income by using the total asset invested by the shareholders. It may be associated with the internal rate of return, IRR.
ROE (%)	Net Income / Total Equity The financial return, ROE express the performance through the eyes of the shareholders. It shows the capacity of the company to distribute dividends or to reinvest the profit.
2. Independent variables – Corporate Governance	
BONUS_CEO	It is computed as ln (Bonuses and compensations)
CEO_DUAL	It is a dummy variable equal to 1 if the CEO is the Chairman of the Board of Directors or equal to 0 if he is not the Chairman
BDSIZE	The size of the Board of Directors. It is computed as ln (Total number of the executives / insiders + total number of the non-executives / independent / outsiders)
BDFEM	The ratio of the total number of women within the Board and the total number of members from Board of Directors.
BDINDEP	The ratio of non-exectutives members and the total number of members from the Board of Directors
RISKCOM	It is a dummy variable equal to 1 if there is a Risk Committee and equal to 0 if there is no Risk Committee
SALARY_CEO	It is computed as ln (Base salary, no compensation)
TENURE_CEO	The number of years since the CEO is leading in that function
YLIST	The number of years since the company was listed on public markets
3. Independent Variables - Control Variables	
SIZE	It represents the size of the company computed as ln (Total Assets)
LEV	Total Debts / Total Equity Leverage shows the ability of the company to honour the long term

obligations.

The YLIST variable shows the age of the company, since the public listing on stock exchange markets. The USA have a system for financing companies, relied primarily on the capital market with high level of development, so that an American company may be regarded as being "effective", in terms of corporate governance, after the listing years. The role of corporate governance is to ensure the proper functioning of the company, in terms of managerial and financial performance, but from the perspective of investors, corporate governance is important because it shows the level of protection of minority shareholders.

Between the selected companies, we included large companies (MSFT) listed in the 80s when it can not speak of an impact of corporate governance and recently listed companies when governance was already implemented.Thus, it can be seen the impact of the corporate governance over the years. It should be noted that in the early years of the listing, a company has a high degree of concentration of ownership (3-4 major investors), and governance indicators are of interest to potential minority investors, along with the performance indicators.

4.2 The empirical methodology

To analyze the relationship between corporate governance and financial performance of companies listed on NASDAQ stock market, we used date panel model, with multifactor regression and we estimated them using the least squares method (OLS). We used generalized least squares (GLS) and the standard error correction for heteroskedasticity using White's method. To test the hypotheses proposed in Section 3 of the paper we chose a multifactor regression in which differing only the independent variable which quantifies the performance (ROA, ROE). Basically is the same econometric model, the difference being made by financial performance variables.

The econometric model used:

1) $Performance_{it} = \alpha + \beta_1 \times BONUS\_CEO_{it} + \beta_2 \times CEO\_DUAL_{it} + \beta_3 \times BDSIZE_{it} + \beta_4 \times BDFEM_{it} + \beta_5 \times BDINDEP_{it} + \beta_6 \times RISKCOMC_{it} + \beta_7 \times SALARY\_CEO_{it} + \beta_8 \times TENURE\_CEO_{it} + \beta_9 \times YLIST_{it} + \beta_{10} \times SIZE_{it} + \beta_{11} \times LEV_{it} + e_{it}$

where:
α is the intercept; is the constant parameter that quantifies the influence of all the variables not included in the model on financial performance
i = the 51 companies listed on NASDAQ stock market, chosen for the econometric models
e_{it} is the residual term or the error term which cuantifies the influence of the random factors nonincluded in the model

In Table 2 there is attached the Descriptive Statistics to capture some of the key statistical information that may be immediately seen to the data. The number of observations is 204. The Descriptive Statistics show that the size of the Board of Directors varies between 12 and 32 members; the maximum CEO's tenure was 26 years (stock symbol EPIQ); an interesting fact is the percentage of women in the total number of members from the Board. The percentage has a high variation, switching from 0.0% for Astro-Med Inc (ALOT) to the maximum value of 42% registered by Procter & Gamble Company (PG).

Table 2. Descriptive Statistics

From Table 3 there can be observed some interesting correlations. Strong positive correlation is observed between the size of the Board of Directors (BDSIZE) and company size (SIZE). The two indicators are composed from different data and are different from an economic point of view. This correlation could be attributed to the fact that it is expected that a large company to have a high number of directors on the Board.

5. Results

The first estimation contains the independent variable ROA. We estimate by OLS method and by using the generalized least squares (GLS). The correlation matrix results led us to apply the standard error correction for heteroskedasticity using White's method.

The relevance of an estimator is bigger and it may be given a greater confidence if its dispersion is reduced (Std. Error). For the regression in which the financial performance is defined by ROA, standard errors indicate a high degree of confidence that can be associated to the coefficients. In Table 4 it can be find the model of determination ratio for ROA, which has values between 29% to 69%, a fact that exceeds the 15% limit proposed by the econometric theory (see Andrei and Bourbonnais, 2008). The statistical inference involves applying the Student t-test which has a P-value less than 5% for the bolded variables from Table 4 which are statistically significant. Another test is the F test that has zero probability associated, a fact which supports the validity of the model for a confidence level of 95%. We used to combat heteroskedasticity the GLS estimation method.

Analyzing the data from Tables 4 and 5, from an economic perspective, it can be observed a positive influence of the variables BONUS_CEO, BDFEM, SALARY_CEO, TENURE_CEO, and YLIST on the financial performance quantified by ROA. It was expected that the remuneration variables to have a positive influence on the economic return, also known as the manager's return. Through compensations, the CEO is incentivized to raise the performance of the company because, these kind of compensations, are linked to performance indicators.

However, it appears that the influence of bonuses on financial performance is very low, aspects explained by the fact that in the post crisis period, the CEOs of companies from US, received bonuses

reduced or even have not received at all, as a penalty, but also as an reduceing expenses in fornt of the uncertain environment. In most studies, company size has a mixed influence on the financial performance. Among the studies recorded by the literature about the link between the CEO's compensations and the financial performance, there is the study of Perry (2006) who demonstrated the existence of a positive connection between the two. Perry (2006) concluded that the CEOs take better decisions if they are rewarded in the form of bonuses. Kang et al (2006) obtained positive correlation between CEO's compensations and financial performance. Hence we have demonstrated the Hypothesis H_3 regarding the existence of a positive link between CEO's compensation and financial performance.

The number of women in the Board of Directors as a variable of corporate governance has a positive influence on ROA. The explanation can be attributed to the fact that they are more balanced in their decisions and presents a higher risk aversion than men do. Women will take less risky decisions that could affect the company's performance and the performance indicator, ROA. Women as CEO have the ability to use more efficiently the company assets, especially human resources, being close to employees and they have a better understanding of their personal problems. Women's creativity combined with the sensitivity can bring new ideas and concepts in the company. Similar results can be found in study of Fidanoski et al (2013) who obtained a negative correlation between the womwn ratio within the Board and proxy indicators for financial performance such as ROA and ROE. Thus, for the analyzed companies we checked the Hypothesis (H_1).

The tenure of CEO is in close relation with human nature. This variable has a positive influence, attributed to the fact that a higher seniority implies more professional experience. The long tenure in the same company makes the manager to fully understand all the mechanisms operating within that company and he knows the real financial performance to which the company is able to reach. However, in the literature, some authors consider that long tenure can have a negative effects, because the manager is to sure of his position and his experience and thus, he can take risky decisions that might have negative effects on the financial performance of the company. Boone et al (2007) obtained a negative correlation between the CEO's tenure and financial performance measured through market indicators (MBR) for US companies. With these results, we did not check the Hypothesis (H_6) regarding the link between CEO's tenure and financial performance.

We obtained negative influence on financial performance measured with ROA from the governance variables such as BDSIZE, CEO_DUAL and BDINDEP. We checked the Hypothesis (H_2) regarding the existence of a negative link between the non-executive members and financial performance. With the correlation obtained for BDSIZE and ROA we did not check the Hypotesis (H_5). The economic explanation which can be attributed to these results is linked about the costs associated to these kinds of variables. The efficiency of the Board of Directors is not given by the large number of members or by the number of independent members. It must be found an optimal level of members to ensure maximum financial performance, reflected by the economic and financial returns. The associated costs will induce a fall in the net profit observable at the level of financial performance indicators. Similar results were registered by Bhagat and Black (2000). Guest (2008) used as proxy for performance ROA and obtained a negative correlation between financial performance and the number of independent members from the Board of Directors inside companies from the US. Erkens et al (2012) also obtained similar results for US companies.

The variable for duality of the CEO registered a negative influence on financial performance, a fact which is explained by the idea that a manager who has the position of the CEO and Chairman at the same time obtains an overgrown power of control. As we find repeatedly in history, a person with great power has the propensity to abuse of it. In case of duality, a CEO can be influenced by the dominance effect and can take wrong financial decisions, believing that he has absolute control, but that decisions can affect the financial performance on long term perspective. Another possible explanation is that the duality may give the CEO an excessive influence and control over other members of the Board of Directors or over the subordinates, inducing a state of irritation and indignation because of the abuse of control, or the abuse of hierarchical superiority (the authoritarian manner), reducing the employees' productivity by increasing the stress levels. The negative correlation between CEO's duality and financial performance was obtained by Bhagat and Bolton (2008).

From Table 6 it is observed that Model 2 which observes the influence of corporate governance variables on financial performance represented by ROE, shows a high degree of confidence for the coefficients obtained. The degree of confidence is supported by the standard errors. Both indicators of the determination ratio, square and adjusted, have an acceptable level, for the GLS estimation (65%), a fact which supports the validity of the models analyzed. The P-value probability associated with the F test is null so we accepted as valid all three forms of estimation used in Model 2 for a confidence level of 95%. Some indicators seem to support the presence of the autocorrelation. We

highlighted by bold form the variables which are statistically significant to be easier to detect. To interpret the results it is required the informations contained in Table 7. There is a positive influence on financial performance exterd by variables BONUS_CEO, LEV, SIZE, TENURE_CEO, and YLIST. The financial return can be interpreted as the sharholders' return. The economic interpretation of the results is the same as the explanations from Model 1, so we have skipped them. Paradoxically, the BONUS_CEO variable is statistically significant but has a very low value as we expected. One explanation for the positive influence on ROE from this form of CEO's compensantion is that the CEOs of the selected companies hold stakes in the companies they are managing and thus, they are stimulated thereby to increase the financial performance. The CEO's compensation is based on ROE. The LEV variable has a positive influence on ROE, which could indicate the presence of the information asymmetry, indirectly. A high indebtedness is preferred by shareholders who like to finance the company's activity with funds from the loans. Also, the Modigliani - Miller theory demonstrated that a company more indebted is more valuable, and because the performance and the value of a company are directly connected, it was expected to achieve a negative influence between LEV and ROE.

The control variable SIZE has an inmportant role in corporate governance and recored a positive link between corporate governance and financial performance. Similar results were ontained by Al-Haddad et al 2011. The positive influence of the size of the company on ROE is not surprising. It is natural that a large company to use resources for increasing the financial performance, and a larger size requires a higher number of shareholders who seek and demand high financial performance from the manager. Erkens et al (2012) obtained for US companies similar results using variables as BDSIZE and LEV. Hillier and McColgan (2006), Lasfer (2006) have proved that large firms had a lower performance when they considered in the models the effect of corporate governance. The CEO's tenure has also a positive influence on ROE and the explanation is based on the fact that tenure brings more experience for the CEO. From the shareholders' perspective, a long tenure can be a tool used by the CEO to convince them that he should remain in the company because he is able to maintain a proper financial performance. The YLIST variable had a positive correlation with ROE. These results can be linked to the idea that over the time, the company gathered more shareholders precisely because it was powerful, and their investment in the company's shares, helped to increase the financial profitability. Thus, it captures the spiral effect of the increasing number of shareholders and the company's financial performance. We disapprove for both Models the Hypothesis (H_6) about the negative relation between CEO's tenure and financial performance.

The negative influence on financial performance it can be observed from the variables BDSIZE, CEO_DUAL, BDINDEP, and RISKC. As in the Model 1, the negative correlation exerted by BDSIZE and BDINDEP can be attributed to the costs which must be paid by the shareholders to have a large number of members within the Board of Directors. Negative correlation between the number of non-executives members and financial performance was obtained by Hermalin and Weisbach (1991), Yermack (1996); Metrick and Ishii (2002). Regarding the negative correlation between BDSIZE and ROE, similar results were obtained by Haniffa and Hudaib (2006); Cheng (2008), Dutta and Chang (2012). The CEO_DUAL had a negative effect on the financial performance due to reasons linked to human nature. Too much power leads to slippages that may affect the financial performance. Shareholders do not want the CEO to hold two senior-level hierarchical positions inside the company because it can lead to specific problems brought by the informational asymmetry. This is recognized by the codes of governance, since many prohibit the CEO duality. The results support the Hypothesis (H_4). Paradoxically, the RISKC variable had a negative impact on ROE contrary to the expectations. The only explanation that can be ascribed to this is related to the nature of costs. The shareholders can consider the Risk Committee redundant from the cost perspective. The time when the Risk Committee works is important. If such committee is established after the crisis was happened, the shareholders may consider that it is pointless to pay that committee after the hard time has already passed. Erkens et al (2012) have used this variable in the model but they did not obtain statistically significant results.

For the Model 2, the remaining variables were statistically insignificant.

6. Conclusions

The aim of this study was to identify a link between variables of corporate governance and financial performance in a context of the human nature. To study this relationship empirically, we used a sample of 51 companies listed on NASDAQ stock market from technology sector. We used two econometric models, the difference between them being the independent variable considered as proxy for financial performance (ROA, ROE). Among corporate governance variables we used the total number of members of the Board of Directors, the number of independent members, gender diversity and specific characteristics of CEO (duality, seniority, remuneration). We used the OLS, GLS methods and the White's method for correcting the heteroskedasticity.

For Model 1, were verified some of the empirical study's hypotheses. The results show that ROA is positively influenced by the share of women in the Board of Directors. This was attributed to the adversity towards risk, characteristic to women. That adversion leads to less risky decisions which can adversely affect the financial performance. The CEO compensation variables have a positive relationship with the economic return, which is expected since we considered ROA as a manager's return. Positive links with financial performance represented by ROA was registered for the variables TENURE_CEO and YLIST. It can be explained by the fact that they provide trust that the company and the CEO can support a financial stability over time.

We obtained negative correlation between financial performance represented by ROA and governance variables. The results verify the existence of a negative link between the number of the independent members and ROA. Similar negative relation was obtained for the BDSIZE. From the perspective of the manager, a large number of members, regardless of origin within the Board of Directors, is a financial problem regarding the costs, which are reflected negatively on the financial performance. Last variable of corporate governance which negatively impacts the economic profitability is CEO_DUAL, a fact explained by the human nature and much power available to a single man who can gets to wrong decisions that may affect the financial performance.

In Model 2 we wanted to study the financial performance in context of corporate governance from the perspective of another category of stakeholders involved in a company - the shareholders. Thus, we chose as proxy for financial performance, the return on equity (ROE) that can be called by some authors as the shareholder's return. The empirical results obtained in the econometric study showed a positive relationship between ROE and CEO's compensation through bonuses and salaries an surprising fact because the shareholders want a lower costs. On the other hand through these compensantions, the informational asymmetry is reduced and this reflects positively on the financial performance. The variables SIZE and LEV had a positive influence on the financial return being an clue that on financial performance there are other influence factors. In fact, the influence of corporate governance variables although statistically significant, is reduced as the value of the coefficients. It supports the idea that the American companies have the financial performance influenced more by peculiarities of the corporate finance. The variables YLIST and TENURE_CEO have had a positive influence on financial profitability.

The Model 2 with financial return as an indicator of performance, presents in the results of the econometric study conducted, negative links similar to Model 1, the difference being the variable RISKC. This variable captures the presence of a Risk Committee in the company and would be expected to have a negative value on the financial performance. The positive result can be attributed to the fact that the analyzed period is post-crisis and a special commission for risk it does not have sense, from a financial point of view, being for the shareholders additional costs. For future research we propose increasing the sample of companies, the number of sectors analyzed, by applying complex models of analysis.

Abstract

The paper provides characteristics of the tax reforms carried out in the People's Republic of China from the second half of the twentieth century. The practice of tax reforms in terms of building socialism with Chinese specifics is linked to the Rostow's Stages of growth model. The example of China illustrates how successful the tax targeting can be in the implementation of a consistent program of sustainable development of national economy. The objectives of the tax reforms in People's Republic of China differed according to the stage of economic growth: the simplification of the tax system in the traditional society, reducing the tax burden as a precondition for the take-off, increase of the tax burden on business at the stage of the take-off, the focus on social justice at the 'drive to maturity' stage.

Keywords: taxation, tax reform, stages of economic growth, China's tax system.

Introduction

Transformational shifts of economic systems are always accompanied by dramatic changes in national taxation. The implementation of the China's market-oriented economic reform that started in 1978 and pursuing an open foreign economic policy also led to profound changes in the tax system. The development of the non-state sector in the economy and improvement of state enterprises' economic independence dramatically narrowed the possibility of administrative redistribution for economic resources. In these circumstances, the taxes acquired a fundamentally new role: they have not only become an important channel for mobilization of financial resources by the state, but also one of the main economic regulators for the entire economic life of the country, deliberately built into the global economy not as a supplier of raw materials, but as one of its drivers. The PRC accomplishes a transformational shift from an extremely backward society to a post-industrial society, that wins in the fierce competition on the global markets, building up an unprecedented financial and economic potential, openly claiming the world leadership (China, 2013).

Despite the fact that China's economic growth has become an object of close attention from scientists around the world (Yueh, 2013; Singh, 2015; Zhao, 2015), the contribution of the tax system to the overall economic progress of the country is poorly reflected in the literature. At the same time the correlation between economic and a tax system is obvious: tax burden is a key component of country's investment climate, which constitutes the basis for economic growth.

The process of China's economic growth was not uniform. Economic development of modern China, in our view, may be considered in the framework of the Stages of economic growth model proposed by Walt Rostow (Rostow, 1960). Existing studies that link tax regimes with the stages of economic growth on historical examples (Einhorn, 2009) represent a worthy model for such an analysis of the tax reforms in modern China.

Methodology

The purpose of the paper is to study the experience of reforming the tax system of the PRC aimed at ensuring sustainable growth of the national economy in the context of the different stages of economic growth. A particular interest in this problem is caused by the fact that in the period of transition to a market economy the inherent features of the Chinese tax reforms were the gradualism and cautiousness as well as measured approach to the planned changeovers in the economic system. As a result, the successful tax reforms, along with other factors, laid a financial foundation for the future transformation of the national economic system in accordance with the requirements of adaptation to the global market.

The first phase of the study covers the analysis of the parameters and characteristics of the economic growth of the People's Republic of China from 1953 until present. As a result, the stages of economic development were distinguished and correlated with the stages of economic growth proposed by Walt Rostow.

The second phase of the study examines the impact of Chinese socio-economic reforms of 1953, 1978, 1994 and 2006 on national taxation. The gradual transformation of the national tax system is in the spotlight. On each of the distinguished stages of economic growth, we analyzed the direction of the tax reforms and tax systems structure. In particular the following topics were considered: 1) the list of taxes, 2) the details of the taxes that are key for fiscal revenues - their subjects, payers, rate structure, tax incentives, 3) periods and reasons for the levy and lifting of taxes; 4) the significance of particular taxes in the state's tax revenue system in dynamics; 5) tax revenues comparing to GDP in dynamics.

Growth stages

The Rostow's stages of economic growth are applied by researchers to the western as well as to the eastern economies (Arora, 2009; Ortolano, 2015). While the model itself is the subject of discussion (Kuznets, 1963), including the context of its applicability to the regions (Parr, 2001). Nevertheless, China's social and economic reforms carried out in the second half of the XX century (in 1953, 1978, 1994 and 2006) represent a vivid illustration of the Rostow's stages of economic growth.

W. Rostow described *first stage* – the traditional society – as one whose structure is developed within limited production function. These societies, because of the limitation on productivity, had to devote a very high proportion of their resources to agriculture. Both in the longer past and in recent times the story of traditional societies was thus a story of endless change. However, the level of productivity was limited by the inaccessibility of modern science, its applications, and its frame of mind (Rostow, 1960).

This stage was present in People's Republic of China from 1953 to 1977. The defining attributes of building a planned economy in a society defined as "traditional" are: 75% of working population is employed in food production; national income is used mainly unproductively; political power is vested in central government.

The *second stage* of growth embraces societies in the process of transition; that is, the period when the preconditions for take-off are developed. Investment increases, notably in transport, communications, and in raw materials in which other nations may have an economic interest. The scope of commerce, internal and external, widens. In addition, here and there, modern manufacturing enterprise appears, using the new methods. Nevertheless, all this activity proceeds at a limited pace within an economy and a society still mainly characterized by traditional low-productivity methods, by the old social structure and values, and by the regionally based political institutions that developed in conjunction with them (Rostow, 1960).

The preconditions for the take-off were built in the People's Republic of China from 1978 to 1993 during the transition from a planned economy to a market economy (economic policy of "Reform & Opening up").

The *third stage* - the take-off - is the interval when the old blocks and resistances to steady growth are finally overcome. The forces making for economic progress, which yielded limited bursts and enclaves of modern activity, expand and come to dominate the society. Growth becomes its normal condition (Rostow, 1960).

The growth of investment rate, the significant increase in the output per capita, the rapid introduction of new technology in industry and agriculture from 1994 to 2005, testified to the take-off in modern China.

After take-off there follows a long interval of sustained if fluctuating progress, as the now regularly growing economy drives to extend modern technology over the whole front of its economic activity. The economy finds its place in the international economy: goods formerly imported are produced at home; new import requirements develop, and new export commodities to match them. (Rostow, 1960). The fourth stage - the drive to maturity – began in PRC from 2006.

Tax reforms on different stages of economic growth

1. Tax reforms in the traditional society (1953 to 1977**).** The modern tax system in the PRC began to take shape in the course of the first Five-Year Plan (1953-1958) aimed at the country's industrialization and gradual socialist reforming. A modification of the tax system was carried out in the process of its realization: were imposed industrial and commercial taxes, excise taxes on alcohol, wine, beer, matches, tobacco products and other goods; was corrected transport tax; were abolished special consumption tax, commodity circulation tax (table 1). In general, there was a significant reduction in the number of taxes and duties.

Table 1:Tax system of PRC in 1953

Taxes	Share in total tax revenues
Industrial and commercial tax	41%
Agriculture tax	23%
Transport tax	2%

At this stage the thesis about tax system simplification was fulfilled. For this purposes the taxes on state and collective enterprises were consolidated, a unified industrial and commercial turnover tax started to be charged, tax rates and taxable items changed. The most indicative changes occurred with the industrial and commercial tax: from 1958 to 1977 it combined six types of taxes. Before 1978 one hundred four categories of taxable goods existed within the framework of industrial and commercial tax.

After gradual industrialization the share of tax revenue from agriculture in total fiscal revenue began to decline step-by-step; the industrial and commercial tax become a primary source of funding the needs of the Chinese government (table 2).

Table 2: Tax system of PRC during the "cultural revolution" (1966-1977)

Taxes	Share in total tax revenues
Industrial and commercial tax	91,16%
Interest income tax	8,84%
Duty on the sale of real estate	
Agriculture tax	
Tax on livestock	
Urban real estate tax	
Custom duties	
Other taxes

In general, the tax system of those years was adequate to the existing economic system, which was dominated by the principle of egalitarian justice alongside with an extremely low level of consumption: the state's resources were equally divided between the citizens, the taxes were not numerous, and they were calculated by a simple scheme. At the same time, the established traditional economic system made it impossible for the country to develop. The main obstacle was the fact that China remained economically closed with its state-controlled economy without large-scale sources of investment, in the total absence of links with the international trade community. In the economic sphere the spirit of healthy competition was lost, the state provided support to all enterprises, regardless of their economic efficiency. As a result, many enterprises lost the incentives for further development; the growth of economic indicators was unstable.

2. Tax reforms as precondition for take-off (1978–1993). In 1978 was implemented a tax reform, after which a rejection of the simplification principle took place and some taxes and fees were restored.

To avoid a dangerous decrease in fiscal revenues and unreasonable increase of social payments by the state, the former method of payments from state enterprises' profit was replaced by a enterprise income tax, that became an important element of fiscal reform. Initially the enterprise income tax was levied in parallel with the payments from profits. Then the payments from profits were replaced by taxation, based on actual profits. Advantages of the new tax system are as follows:

- The companies stopped spending time on fighting for the fixed sum of the assignments to the budget and allocation rates, and started to make efforts to upgrade technical equipment, search for internal reserves, increasing the economic efficiency of their manufactures;

- After replacing the payments from profits by a income tax the enterprises began to pay an equal sums to central and local budgets.

During 1979-1993 the tax system was changed together with the development of the national economy. A modern legislative framework began to form, the structure of taxes was transformed, the tax administration improved.

However, the tax system had a significant disadvantage, which manifested itself in its duality. In practice, two tax systems worked simultaneously. The first system was applied to state, collective and private enterprises, while the second system, which included a privileged tax treatment, was functioning in the enterprises with foreign capital participation (table 3). In addition, the enterprises with foreign capital were subject to industrial and commercial tax according to the law of 1958, while the domestic state, collective and private enterprises paid production charges, tax on economic

activity. As a result, the domestic enterprises and enterprises involving foreign capital were in different economic conditions.

Table 3: Tax system of PRC during creation the precondition for take-off

Groups of taxes	Taxes in 1990	Tax rate	Beginning of imposition
1. Turnover taxes	Industrial and commercial tax	3%-60%	11.09.1950

By the end of 1993, China had almost no income taxation of individuals due to low income level of the vast majority of the population. Income taxation of individuals existed only in theory, being declared in tax legislation; the actual non-taxable minimum of the biggest part of population was higher than the average wage. The main payers of the income tax were the owners of private enterprises and foreigners.

Turnover taxes focused on fixed retail and wholesale prices and charged by the administrative order could not be effective in market economy. Therefore, on a trial basis in a number of provinces were introduced consumption tax, VAT, business tax instead of industrial and commercial tax The VAT included in the price of goods was the most reliable in providing the fiscal revenue.

As a result, they established a tax system that was based on turnover taxes, enterprise income tax and personal income tax, while all other taxes were minor. The formed tax system laid the foundation for a tax reform of 1994 in the framework of the "take-off", focused on building a socially oriented market economy; and to start expanding the tax base.

Tax reforms at the 'take-off' stage (1994–2005). At the stage of the economic "take-off" a new tax structure (table 4) and a new system of national tax administration were created.

Table 4: Tax system of PRC at the "take-off' stage

Groups of taxes	Taxes in 2005	Tax rate	Beginning of imposition
1. Turnover taxes	Value added tax	0%; 3%; 13%; 17%	01.01.1994
	Consumption tax	3%-56%	01.01.1994
	Business tax	3%; 5-20%	01.01.1994
2. Income taxes	Enterprise income tax	15%-24%;33%	01.01.1994
	Income tax on enterprises with foreign investment and on foreign enterprises	15%-24%; (30+3)%	01.07.1991
	Individual income tax	5%-45%;5%-35%;20%	10.09.1994
3. Resource taxes	Resource tax	8-30 yuan per 1 ton; 2-15 yuan per 1,000 cubic meters.	01.01.1994
	Urban and township land use tax	0,2-10 yuan per 1 sq. meter	27.09.1988
4. Property taxes	Housing property tax	1,2%; 12%	01.10.1986
	Urban real estate tax	1,2%; 18%	08.08.1951
5. Taxes for special purposes	City maintenance and construction Tax	1% ; 5% ; 7%	08.02.1985
	Farmland occupation tax	12,5-45 yuan per 1 sq. meter	01.04.1987
	Fixed asset investment orientation regulation tax	30%-60%	01.01.1994
	Additional education tax	1-3%	01.01.1994

6. Behavior taxes	Vehicle and vessel usage tax	1,2-30 yuan; 360 yuan; 0,6-5 yuan per 1 ton	01.01.1994
	Vehicle and vessel acquisition tax	1,2-30 yuan;360 yuan; 0,6-5 yuan per 1 ton	01.01.1994
	Stamp tax	0,005%;0,03%-0,1%	06.08.1988
	Deed tax	3%-5%	03.04.1950
	Slaughter tax	10%; 12-30 yuan	01.01.1994
	Banquet tax	15-20%	01.01.1994
7. Agricultural taxes	Agriculture tax	8%	30.01.1994
	Tax on livestock	0,2-1 yuan	11.09.1950
8. Customs duties	Reduced tariffs on imports: agricultural products from 22% to 17%, vehicles – from 80-100% in 2001 to 25% by mid-2006. Eliminated tariffs on information technology products - by 2005.

Due to the expansion of the tax base, since 1995, a trend of relative increase in tax revenue to the budget appeared (figure 1).

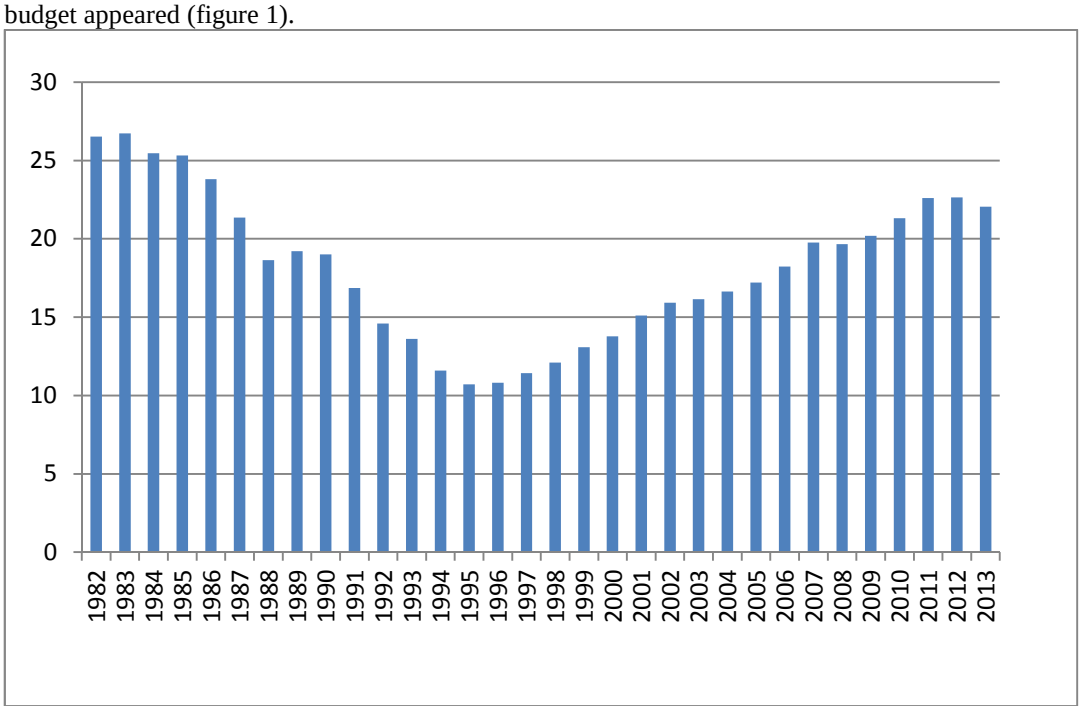

Figure 1: State revenues in PRC,% of GDP

Source: based on (China statistical yearbook, 2014)

Although the tax reform of 1994 led to significant results, due to which the Chinese tax system provided the growth of fiscal revenues, it contained certain disadvantages. Vestiges of the old system (collection of the enterprise income tax in accordance with the administrative subordination) hampered the free movement of capital between different areas, so it was necessary to take measures for eliminating these barriers. It was also important to improve the system of tax differentiation to standardize the rates and put right the administration of new taxes, such as individual income tax.

In light with China's course for accession to the WTO since 1994, the government began to implement a reform of the new tax system based on international standards and principles of globalization. After having joined the WTO on December 11, 2001, China first of all had to cancel the vast majority of non-tariff barriers. The most important task of the tax reform after an adaptation

period (5 years) was not only a change in the tax system in accordance with international standards, but also a maximum protection and support of weak industries.

In 1978-2005 one of the objectives was to create a system for attracting foreign direct investment, so the particularity of the tax regulation was to develop a system of tax incentives for companies with foreign capital and their legal registration. Tax credits, tax exemptions on a territorial basis (for example, registration of the enterprise in special economic zones) were set for companies with foreign capital. The national capital, as a rule, could not benefit from these privileges.

With the course of time, the success of the tax reform of 1994 identified the need to improve the model of tax differentiation and tax rates standardization primarily in the sphere of individual income tax.

Tax transformation at the drive to maturity stage. Since 2006, the purpose of the tax reform is to ensure the social justice. Reforming of the tax system in China at this stage is aimed at creation of equal tax conditions for companies both with national and foreign capital. In addition, the Chinese government introduced amendments to the Individual Income Tax Law and raised the level of incomes that are exempt from personal income tax that created a favorable tax climate for the overall internal and external activities of the domestic small and medium enterprises.

To increase the competitiveness of the national economy and improve the economic situation the tax system was mainly focused on the enterprise income tax, the VAT and the individual income tax (table 5). In general, the “drive to maturity” was politically formalized as a movement in the direction of market economy with Chinese specifics.

Table 5: The transformation of the tax system for building a market economy with Chinese characteristics

Groups of taxes	Taxes from 2012	Tax rate

The global financial and economic crisis created an opportunity for domestic economic growth, advanced the China's economy in the direction of the fifth stage - the age of high mass consumption. In general, a shift was made from the proposal on the international market to the domestic demand,

from export production to national consumption. This set up a problem and broke the ice in shifting the focus of taxation from production to consumption and starting the development and introduction of environmental taxes.

The ongoing tax reforms in China were reflected in the structural changes in tax revenues (table 6).

The tax reforms performed on the stages led to reduction in tax revenues in absolute terms, as well as in the structure of budget revenues and with respect to the gross domestic product (the smallest figure of tax revenue relative to GDP for the period was observed in 1996). What is more, this progressive reduction in tax revenue was carried out at the expense of direct business taxes, while the revenues from indirect taxes increased. Beginning from 1997 the growth in tax revenues was accompanied by a decrease in revenues from indirect taxes (especially the VAT) and the growth of direct taxes, especially the taxes on financial results of the business. The importance of the individual income tax is much less than that of the enterprise income tax.

The evolution of China's tax system is correlated with the global trend of reducing the share of indirect taxes and increasing the share of direct taxes. At the same time, the role of indirect taxes in generating revenues for the state is still high.

Also in the course of the reforms a trend of increasing the number of tax incentives and deductions in taxation of both individuals and enterprises appeared. Tax incentives are a tool against economic instability and one of the factors attracting foreign investment.

From a long-term perspective, the aim of tax structure improvement of the PRC should be in bringing the tax system in line with the tax structures of the advanced countries (Brys, 2013: Yang, 2011) through optimization, creating a high-performance, reasonable tax system, in which the central role would be given to the VAT, but the enterprise income tax and individual income tax would be of equal importance.

Conclusions and Discussion

The most important features of the tax reforms held in the period of building the market economy in China is their uniformity, consistency and gradualism.

It is a common practice in China when the viability of any new idea is firstly tested on the example of a single province. If experiment is successful, the relevant amendments to the legislation are made, and the changes will be applied to the entire state. This ensures a uniformity of the impact of changes in the tax system on the economy as a whole. It should be mentioned that the importance of the economic experiment is manifested in the fact that the measures of tax incentives are implemented on the zones of economic and technological development.

The China's tax reforms of the second half of the twentieth century are a good example of how the tax system can put no obstacles to the development of the economy and even to promote the rapid and successful passage of the stages of economic growth. Depending on the stage of economic growth, the goal setting changes in tax targeting as follows:

- The simplifying of tax system is a reference point in the *traditional society*,

- A part of the taxes is re-established on the background of the overall decrease in tax burden as a *precondition for the take-off*,

- A new structure of tax system is formed, which leads to the increase in tax revenues at the stage of *take-off*.

- The '*drive to maturity'* stage is focused on social justice.

In the process of reforming the tax system of the PRC we could always see the effect of such factors as the huge working-age population with limited domestic energy resources and other raw materials, the dominant role of public enterprises in the national economic structure, and others. Despite the evident peculiarity of China, the taxation factor in the rapid economic growth can serve as a subject for scrutiny and be implemented on transition economies of Russia, Belarus and Ukraine in particular along with monetary policy (Mishchenko, 2015).

Despite the record economic growth over the last 35 years, the emerging market economy of China has accentuated very acute social problems, such as the significant dependence of economic development on exports, increasing income inequality, the excessive growth of house prices, etc. In the process of reforming the tax system there are still unsolved problems that significantly worsened during the global financial crisis. For example, a tax reform aimed at the division of taxes paid to local and central budgets is still not completed; the structure of local taxation is inefficient; unfair distribution of the tax burden between economic entities still exists. These problems remain a significant deterrent to structural transformation of the national economy and an obstacle in the creation of the preconditions for sustainable economic growth in all regions.

Abstract

The tax burden is not only a tool for monitoring and planning of financial and economic affairs of the company, but also an important reference point for the state tax policy development as well as for inter-budgetary relations. Taking into account the issues related to the current tax system, a method of oil companies tax burden calculation is presented considering the production of hydrocarbons in oil equivalent. The proposed method makes it possible to reveal the impact of the current taxation system on the affairs of oil companies' which differ in the scope of activities, commodity and territorial diversification.

Keywords: tax, oil, oil equivalent, Tomsk region

Introduction

The relevance of the tax issue is retained from the times of Adam Smith, who was the first to formulate the basic principles of the tax system, which were further developed in the researches of scientists studying the tax burden of oil companies in various aspects. In a research study by John Harper (1963) different methods of oil companies tax burden calculation were investigated. This allowed him to draw the conclusion about tax burden distortions in the industry as well as about federal tax burden which was significant for further changing of the fiscal regime in the US [10]. In the work by Matthew Berman (2014) subject of tax allocation in the budget system and the real oil-producing state income budget on the example of Alaska, considering oil price dynamics at fiscal regimes for the period from 1959 to 2013 was studied [12].

Matthew Berman concludes that sharp reducing of the effective tax rates may negatively affect Alaska state revenue, thus tax rates should be different depending on the field. This will boost the development of the oil industry. Another important issue is the distribution of oil revenues and the profits of the states or provinces in the US. Subject of accumulating money in the oil funds of the regions and proposals of funds creation are viewed in his work as – "It can be an important tool for enhancing growth, diversification of the production base and competitiveness in the economy" [7, P. 123]. The Scottish Government should seek, in principle, to establish a stabilisation fund such as an Oil Fund, to help manage its natural resources and to enhance future economic resilience [7, P.15]. These issues are similar in the taxation of oil-producing companies in Russia, which is a factor of oil and gas sector investment potential reduction, reduction of oil-producing regions tax potential, and financial and investment constraint of regional authorities in solving social and economic issues [20, 9]

Methodology

The study aims to evaluate the tax burden of Russian oil and gas companies on the basis of financial data and annual reporting. The applied nature of the research involves the application of the suggested method of calculating the tax burden on oil companies, which are different in size and area of activity, during the tax system adjustment and implementation of strategic programs of socio-economic regions development.

Interrelation of current oil companies' taxation system and financial and economic processes of Russian economy

The share of Russia in the world oil production is 12.6% and of the world gas production - 18.1%. This stipulates the high dependence of the Russian economy on oil and gas revenues. In our study we will focus on the aspects that characterize the relationship of the current oil companies' taxation system and the financial and economic processes of Russian economy.

Petroleum sector is the main income source into the budget system of the country, and despite the measures taken by the Government of the Russian Federation, this tendency remains. This is supported by data presented in Table 1.

Table 1. The share of companies' revenue in a state budget (in % GDP)

	2008	**2009**	**2010**	**2011**	**2012**	**2013**	**2014**
Total revenue	39.17	35.04	34.62	37.26	37.69	36.93	36.93
Tax revenues and payments	36.04	30.88	31.12	34.5	34.97	34.11	34.42
Mineral Extraction Tax (MET)	4.14	2.72	3.04	3.65	3.96	3.89	4.07
MET on oil	3.81	2.41	2.74	3.3	3.43	3.31	3.45
MET on gas	0.24	0.21	0.2	0.25	0.43	0.49	0.52
Export custom duty on oil	4.32	3.1	3.61	4.17	4	3.53	3.67
Export custom duty on gas	1.19	1.12	0.42	0.69	0.7	0.72	0.68
Export custom duty on petroleum products	1.27	0.98	1.3	1.67	1.82	1.82	2.09
Custom duty (during the export of crude oil and definite categories of oil produced products from the Republic of Belarus outside the Custom Union)	0	0	0	0.16	0.19	0.16	0.15
Mineral oil excise tax	0.34	0.38	0.37	0.51	0.59	0.63	0.54

As it is seen from the Table, about 93% of the budget system revenues are the tax payments. In the tax revenues more than 40% are oil and gas revenues - the specific taxes paid by oil and gas companies as a minerals extraction tax (MET) on hydrocarbons (oil and flammable natural gas, gas condensate) and export customs duties on crude oil, natural gas, petroleum products (Art. 96.6 of the Budget Code of Russian Federation) [15]. The table shows that MET on oil exceeds more than 6 times the MET on gas, which is associated with a lower taxation of the gas industry. This becomes more obvious after calculations given below. Similar difference is observed in gas export duties and MET on gas [16, P.6]. Despite the changes in MET calculating formulas and export duty in order to stimulate the activities of oil and gas companies, as well as the state fiscal gap as a consequence of these changes, the share of oil and gas revenues is significant [8].

Another important point is the centralization of oil and gas revenues in the federal budget. The impact of uneven distribution could be seen from the example of Tomsk region. Tomsk region is located in Western Siberia - the main oil-producing region of Russia. It ranks third in production after the Tyumen region and Khanty-Mansiysk Autonomous Region. At that, from 131 deposits of Tomsk region, only 6 could be referred to large. Oil deposits are prevailing. Reducing of the tax potential is well illustrated by the data presented in Table 2. In 2010 there was a centralization of revenue from MET in the federal budget. Prior to the global financial and economic crisis 5% of MET on oil got into the budget of RF oil-producing subjects. Earlier before the year 2005, 40% got into the regional budgets.

Table 2. The share of MET in the structure of Tomsk region budget income.

	2003	2004	2005	2006	2007	2008	2009
The share of MET in the structure of region budget income (%)	20.51	17.92	6.91	5.85	5.27	6.26	3.58

This is a factor that explains the reduction in the financial and investment opportunities of the regions in the realization of socio-economic issues (Table 3). The table reflects the substantial increase in fiscal gap, the increase of deficit, and therefore debt obligations, which is partially offset by grants and subsidies from the federal budget. In 2015 the increase of fiscal gap was especially significant. This was due to federal budget obligations default before the Russian Federation subject [13].

Table 3. Dynamics of Tomsk region fiscal gap

	Tomsk region fiscal revenue, mln RUB	Tomsk region fiscal gap, mln RUB
2009	31851.3043	-442.5649
2010	34177.9528	+193.2263
2012	52 580.7	-2 062.1
2013	53 684.4	-6 830.7
2014	48 598.3	-5 365.6
2015	51 135.4	-176609.0

Oil and gas sector structure analysis shows the predominance of large, vertically integrated companies (VICs) in the oil industry of the country. The share of such VICs as "Rosneft", "LUKOIL", "Gasprom neft", "Surgutneftegas" is 70.7%. The share of small companies is less than 10%. Therefore, the petroleum market structure is oligopolistic: from 292 organizations, only 10 are vertically integrated oil companies. The oligopolistic market prevalence is marked by low competition in the industry, the possibility of collusion and market sharing between the vertically integrated oil companies, the pressure on other oil companies' activity. All these negatively effects on the dynamics of prices in the consumer market and becomes an indirect factor of the inflation and innovation activities of both petroleum sector and the national economy [11].

Another feature is the increase in oil production by state companies. Through acquisition of TNK-BP, "Rosneft" increased its share in the total volume of oil production from 22% in 2010 to 36.2% in 2014. In the gas sector, the role of state-owned companies is even more significant: "Gazprom" - 71, 5%, "Rosneft" - 5.9%.

Tax burden analysis

The relative indexes were applied during the analysis of the tax burden of business entities. During calculation the numerator may include the amount of tax payments, severance tax, income tax and other tax payments realized by mining companies. The denominator may include net income, tax payments and other indicators depending on the research objectives. The Ministry of Finance of the Russian Federation determines the tax burden as a ratio of the amount of taxes to the volume of sales; the Federal Tax Service - as a ratio of the amount of taxes paid from sales [14, P.44]. Oil and gas companies suggest their own calculations of the tax burden. The "LUKOIL" company during tax burden analysis considers the share of tax revenues, excluding the cost of crude oil and petroleum products purchase (%), the share of income before income taxation, excise taxes and export duties payments (%) [1, P.65]. Besides, the tax burden is expressed in the form of financial indexes: a) Effective income tax rate (%), which is calculated as the ratio of income tax to pre-tax earnings before non-controlling interest; b) the share of pre-tax earnings in revenue (%) [1, P.72]. The company also focuses attention on the fact that the amount of the MET per 1 ton of produced and refined oil is steadily increasing. The average rates of MET, applied by companies for the taxation are shown in Table 4.

Table 4. Average MET rates on oil and gas

	2010	**2011**	**2012**	**2013**	**2014**
MET (oil), RUB/t	3 075.8	4 456.5	5 066.0	5 329.6	5 827.5
MET (natural gas), RUB/thous. m³	147.0	237.0	251.0	333.5	301.5

The formula of MET calculation involves base rate and applied concessionary rates, provided for the development of hard-to-recover reserves, depleted deposits, high-viscosity oil deposits located in new oil and gas provinces and small deposits [17].
The size of MET on gas depends on the degree of production difficulty and transportation costs. However, these methods, according to the authors, do not take into account the specifics of the oil and gas companies. Major oil and gas companies are called vertically integrated companies (VICs), because they include the entire production cycle - exploration, production, processing and marketing. In addition, they have the license areas, geographically located in the traditional and new oil and gas provinces. The deposits under production are: a) oil and gas; b) large and medium; c) Brownfields and Greenfields; d) various in oil quality (light, high sulfur, high viscosity, etc.). The activity of small companies does not include all the stages of technological processes. The main activity is the exploration and production of hydrocarbons. The majority of small production companies acquired a license for exploration and production of minerals only in the past 10 years, thus they are at an early stage of its development. Small oil and gas companies have from 1 to 3 license areas, deposits of which are classified as small, with the amount of reserves of up to 5 million tons [18].

Consequently, the amount of MET calculated considering preferential rates and preferential rates free, is different. Therefore, it is preferable to use the following index: MET / 1 ton of oil equivalent. According to the Decree of the State Statistics Committee, 1 ton (thousand cubic meters, thousand kWh, Gcal), multiplied by the conversion factor (on oil k = 1.43, on natural combustible gas - 1,154) in the conventional fuel equals to 1 ton of oil equivalent [19, P.9].

Results

The authors made the calculations taking into account the suggested index. The data of "Rosneft", "LUKOIL", "Tomskgasprom" and "Tomskaya Neft" [5, 6, 3, 2] companies were used for the analysis. These companies vary in the scope of their activity and in the territorial belonging of industrial diversification licensed areas. The results are shown in Table 5

Table 5. Comparative analysis of petroleum companies' tax burden

«Rosneft»	**2013**	**2014**

MET/Net revenue	1.014487979	1.710068025
Production in thousand tons of oil equivalent	1564077.158	1695936.414
MET/1 ton of oil equivalent	1240.372391	1509.966826
Tomskaya neft	**2013**	**2014**

Revenue in thousands of RUB	10 189 073	9 538 392
Production in thousand tons	993. 403	883. 214
Production in thousand tons of oil equivalent	1420.56629	1262.99602
Net revenue in thousands of RUB	837 664	398 747
MET in thousands of RUB	5 191 134	5 219 426
MET/Revenue in thousands of RUB	0.509480499	0.547201876
MET/Net revenue in thousands of RUB	6.197155423	13.08956807
MET/1 ton of oil equivalent	3654.270861	4132.575176

The data presented in Table 5 shows that companies' indexes of MET/Revenue from sales, MET/Net revenue and MET/1 ton of oil equivalent differ as for the year 2013 and 2014. Each company shows the growth of MET/Revenue from sales and MET/Net revenue indexes besides OAO "Tomskneft". Only "Rosneft" shows MET/1 ton of oil equivalent index reduction, while the rest of the companies show the growth of this index.

Summarizing the above mentioned, the conclusion could be drawn regarding the dynamics of the suggested index of MET / 1 fuel equivalent:

1. Factors determining the increase of tax burden of OAO "LUKOIL" are the territorial and product diversification. "LUKOIL" develops its production activity primarily in Western Siberia, the Volga region, the Urals, Timan-Pechora region [4], deposits of which have been developed for more than 30 years, thus reflecting on quality characteristics of the produced fluid. Since the average water cut in 2014 was 87.3%, the "Rosneft" company activity concentrated in new oil and gas provinces of Eastern Siberia, where the development was stimulated by tax holidays on MET, and the zero export duty. In addition, the volume of gas production in "Rosneft" exceeds in 2 times the volume of the "LUKOIL" company production.

2. Deposits, developed by "Tomskgazprom" and "Tomskaya Neft" are located in Tomsk region. Considering the amount of reserves these deposits could be referred to small and medium. "Tomskgazprom" develops Myldzhinskoye gas condensate field. According to the obtained results, the tax burden of the small company "Tomskaya Neft" is growing alongside with the production fall. At that, there is a significant difference in values between the companies, which is defined by the fact that "Tomskaya Neft" is involved only in oil production. Oil production by OAO "Tomskgazprom" has risen in 8.58%, the value of MET/1 ton of oil equivalent index - in 21.74%. Oil production in OOO "Tomskaya Neft" has fallen by 11.1%, and the value of MET/1 ton of oil equivalent index increased by 13,1%. The growth of the tax burden in terms of the MET / net profit index also confirms this unevenness.

3. Influence of the current tax system, when there is a direct correlation in the formula of MET amount calculation to the payment from oil prices in the world market, produces greater effect on small oil and gas business, which is clearly illustrated by MET / net income index. In OOO "Tomskaya Neft" the amount of MET exceed 6 times the net profit in 2013, while big companies were having the exceed in 1.5 times.

Conclusion

Thus, the tax laws underexamine the tax base formation in relation to MET depending on the production and geological characteristics, field development stages and scope of oil companies' activities. There is also a lack in tax mechanisms which lay the foundation for business development in the long term. Therefore, further research is needed to improve tax legislation regarding the development of incentives for small oil companies

Résumé

La rivalité concurrentielle oriente les entreprises à suivre une démarche perturbatrice innovatrice, source d'un avantage concurrentiel. Cette recherche s'est réalisée à travers une étude qualitative exploratoire à partir de 42 entretiens menés au niveau d'une série de cas d'entreprises. A cet effet, nous avons résolument opté pour deux types d'acteurs : les nouveaux entrants et les entreprises existantes, ce qui nous a permis d'avoir une analyse détaillée de la dynamique concurrentielle qui prévaut au sein ce secteur et par conséquent les manœuvre innovatrices adoptées par les firmes, ce qui constitue l'originalité de notre étude empirique.
Nos résultats montrent que les entreprises ayant choisi de suivre la perturbation innovatrice ont toutes joui d'une performance en termes de croissance, bénéfices et chiffres d'affaires et sont devenues leaders dans le segment où la perturbation a eu lieu. Cependant, l'inertie a conduit d'autres firmes à l'absorption par la concurrence et la disparition à terme du secteur, en dépit de leur statut de leaders. Nous terminons notre article en apportons des informations pour de possibles recherches futures sur la thématique de la perturbation innovatrice et la dynamique concurrentielle.

Mots clés: Avantage concurrentiel, perturbation innovatrice, dynamique concurrentielle, entreprises algériennes.

Abstract

The competitive rivalry directs companies to follow an innovative disruptive approach, source of a competitive advantage. This research was carried out through an exploratory qualitative study from 42 interviews conducted at the level of a series of business cases. For this, we have resolutely opted for two types of actors: new entrants and the existing firms which allowed us to have a detailed analysis of the competitive dynamics prevailing in this sector, and therefore, the innovative manoeuvres adopted by firms, which constitutes the originality of our empirical study.
Our results show that companies having chosen to follow the innovative disruption have all enjoyed a performance in terms of growth, profits and turnover and have become leaders in the segment where the disturbance occurred. However, inertia has led other companies to absorption by competition and ultimately resulting in the disappearance of these companies in the sector, in spite of their status of leaders. We conclude our article by proposing tracks of research that will complement the current studies on the theme of the innovative disruption and the competitive dynamics.

Key words: Competitive advantage, innovative disruption, competitive dynamics, Algerian companies.

Introduction

La littérature en management stratégique a fait l'objet d'un renouvellement profond d'où l'apparition de plusieurs approches en stratégie, défendant un héritage par rapport aux travaux des économistes de l'école de Vienne, c'est le cas des recherches qui porte sur les thèmes de la disruption (Ferrier, 2000), de l'agressivité concurrentielle (Ferrier et al., 2002), de l'innovation radicale (Blanco, 2007), d'innovation stratégique (Markides, 1997; Baden-Fuller et Pitt, 1996) ou encore de révolution stratégique (Hamel,

2006). Notre présente démarche s'inscrit dans la continuité de ces pistes de recherche et principalement celles proposées par Moingeon & Lehmann-Ortega (2006) et Roy (2009) sur la perturbation innovatrice. Ayant constaté un déficit d'études académiques, ces auteurs ont surtout cherché à expliquer les fondements de cette nouvelle démarche en démontrant son intérêt croissant. Cependant, les études concernant le croisement de la dynamique concurrentielle avec la perturbation innovatrice, susceptibles d'expliquer les liens entre les nouvelles approches comportementales et le choix de cette stratégie, restent rares dans la littérature. Nous tentons à travers cette contribution de combler cette brèche en proposant la perturbation innovatrice dans une logique comportementale mobilisant le courant de la dynamique concurrentielle.

L'objectif de notre étude est de mettre en lumière la dynamique concurrentielle qui règne au sein du secteur des Produits Laitiers Frais en Algérie en décryptant les manœuvres innovatrices adoptées par les acteurs. Notre étude porte sur les principaux opérateurs intervenant sur le marché du yaourt en Algérie, c'est-à-dire Danone Djurdjura Algérie, Hodna Lait, Trèfle, Ramdy et Soummam. Dans un environnement hypercompétitif qui a connu l'accroissement du nombre d'intervenants, notre problématique de recherche est de savoir comment la dynamique concurrentielle génère et encourage l'adoption d'une perturbation innovatrice source d'un avantage concurrentiel ?

Dans un premier temps, nous reviendrons sur l'état de la recherche sur le courant de la dynamique concurrentielle. Ensuite sur la base des recherches consacrées aux approches comportementales, une démarche stratégique sera distinguée celle de la perturbation innovatrice, dont nous nous focalisons plus particulièrement de souligner ses sources. Dans un second temps, nous exposerons notre terrain d'étude ainsi que le dispositif de recherche mis en œuvre. Dans la section suivante, nous proposerons une discussion de nos résultats au regard de la littérature existante. Enfin, nous conclurons en énonçant les limites de notre recherche et proposerons des pistes pour des recherches futures.

Perturbation innovatrice et Volontarisme Total

Dynamique interactive et agressivité

Deux approches complémentaires sont à la base de l'analyse des relations concurrentielles entre les entreprises sur un marché : l'analyse structurelle et l'analyse comportementale. Les insuffisances du niveau d'analyse découlant de l'approche statique de la concurrence (Porter, 1980) ont entraîné l'émergence d'une nouvelle perspective qui est celle de l'approche dynamique des mouvements concurrentiels qui intègre plus nettement les intentions stratégiques animant les entreprises et les règles du jeu concurrentiel (Hamel et Prahalad, 1989). L'émergence du courant de la dynamique concurrentielle a été soutenue par beaucoup de chercheurs en stratégie dont notamment Mac Millan, Mc Caffrey et VanWijk (1985) et développée à travers plusieurs auteurs comme Chen et Miller (1994), D'Aveni (1994), Craig (1996). Adoptant plusieurs niveaux d'analyse, les travaux de ces auteurs (dont notamment ceux de Lee et al. 2000, Bensebaa, 2000 ; Young et al., 2000) atteste que l'avantage concurrentiel dépend de la rapidité des interactions concurrentielles, les entreprises les plus performantes sont celles qui prennent les initiatives d'entreprendre des actions/réactions innovantes contre leurs rivaux à savoir l'agressivité (Brockhoff et Pearson, 1992 ; Calantone et al. 1994; Covin et Covin, 1990; Zhara et Covin ,1993), en introduisant de nouvelles variables innovatrices qui affectent les positions des concurrents. Ce qui leurs permet, tout d'abord, de bénéficier des effets de « first mover » (Makadok, 1998), ensuite, de garder une longueur d'avance sur leurs concurrents, en allant d'un avantage concurrentiel à un autre.

Dans cette perspective, les travaux de D'Aveni (1994,) et Rühli (1997) consolident l'idée précédente selon laquelle l'hypercompétition pousse les marchés vers une concurrence accrue, dans laquelle l'avantage concurrentiel, désormais précaire, va à ceux qui agressent leurs adversaires. D'Aveni (1994) insiste sur le fait que les entreprises qui ne chercheraient pas délibérément à perturber leurs concurrents devraient elles-mêmes être l'objet de manœuvres agressives et donc, connaître de graves difficultés. De ce fait, être plus agressif que ses concurrents en adoptant un comportement perturbateur des règles du jeu concurrentiel, est désormais le seul moyen de rester viable et d'acquérir des parts de marché (Le Roy, 1998).

Vers la perturbation innovatrice

Dans le prolongement des travaux de Bower et Christensen (1995), Abraham et Knight (2001), Markides (1997) les auteurs Lehmann-Ortega et Schoettl (2004) proposent la perturbation innovatrice dont l'idée centrale consiste à déverrouiller et reconfigurer le marché en vue de dégager de nouvelles perspectives de développement encore non explorées. En se basant sur la contribution de Kim et Mauborgne (2005), Schoettl (2005) , Lehmann Ortega et Bourdon (2006), les stratégies perturbatrices consistent à construire de nouveaux espaces inexploités, espace dans lequel la demande est à créer, portant sur une introduction réussie dans un secteur d'un nouveau business modèle, né sur l'un des deux axes suivants : une modification radicale de la valeur pour le client (correspond à une rupture produit/marché), un réaménagement radical de l'architecture de valeur (correspond à une rupture process). Pour mieux comprendre comment créer une perturbation innovatrice.

Partant de ce qui précède, notre proposition se présenterait comme suit :

Proposition : l'intensité de la dynamique des mouvements concurrentiels incite à adopter une démarche agressive à travers un comportement perturbateur innovateur.

Choix Méthodologique Et Empirique

Méthodologie de recherche et traitement de données

Le choix de la méthode de recherche a porté sur une étude de type exploratoire, structuré autour d'études de cas. Plusieurs critères associés à notre recherche justifient l'intérêt de retenir cette option méthodologique. D'abord, l'étude sur les perturbations innovatrices se situe encore dans une phase récente dans la discipline stratégique, ce qui nécessite un travail d'exploration (Charreire et Durieux, 1999). Ensuite, il s'agit de saisir un phénomène dynamique qui est celui de la compréhension de la dynamique des mouvements concurrentiels et l'étude de cas apparaît comme une stratégie de recherche adaptée (Roy, 2003).

Fondée sur une interprétation qualitative de données, nous avons réalisé 42 entretiens d'approfondissement, menés face-à-face avec 33 personnes au niveau de 5 études de cas. Nos entretiens se sont déroulés entre le 8 septembre 2013 au 12 mars 2015. Ils ont duré en moyenne une heure et demie. Ces entretiens nous ont permis de récolter des informations et des données qualitatives et quantitatives. L'analyse des données se concentre principalement sur la période 1996-2015. Le choix concernant les personnes interviewées consistait essentiellement à se concentrer sur les personnes clefs de l'entreprise et la plupart des entretiens ont été réalisés avec l'ensemble des responsables des entreprises étudiées.

Champs d'étude et acteurs sélectionnés – justification

Par rapport au champ d'étude, comme notre idée initiale est d'activer notre objet de recherche dans un contexte où la concurrence est rude, nous avons choisi le secteur des Produits Laitiers Frais (PLF) en Algérie et particulièrement celui du yaourt, d'abord parce que ce secteur est caractérisé par une forte dynamique concurrentielle, ensuite il comporte des opérateurs avec des positions concurrentielles différentes : leader, challenger et suiveur, ce sont des firmes soient déjà installées dans le secteur, soient des nouveaux entrants, et de ce fait, ce secteur présente un contexte particulièrement riche en termes d'enseignements sur la dynamique des attitudes stratégiques ce qui nous permettra ainsi de questionner des problématiques de management stratégique concurrentiel dans un contexte concret.

a) Les acteurs existants :

- Soummam est leader depuis 2006 dans le segment du yaourt en pot avec plus de 35 références. Il dispose d'environ 48% de parts de marché.

- Danone Djurdjura Algérie (DDA), est une firme multinationale, filiale du groupe français Danone en Algérie, c'est le principal challenger de Soummam avec 27% de parts de marché.
- Trèfle (7% de parts de marché), une des sociétés pionnières, elle est actuellement suiveur dans le marché.

b) Les nouveaux acteurs :

- Hodna (13% de parts de marché) est un des deux plus grands opérateurs après DDA et a notamment pris une position de force sur le marché algérien.
- Nous avons également accordé une place particulière à Ramdy, c'est la plus jeune dans le marché. Elle détient 2% de parts de marché avec des perspectives de croissance dans le futur.

Résultat De La Recherche Et Discussion

Rivalité concurrentielle et option stratégique

L'intensité concurrentielle dans le secteur des PLF

Avec le passage de l'Algérie à l'économie de marché, le secteur laitier a connu l'accroissement de l'intensité concurrentielle, ceci étant dû à plusieurs facteurs dont nous citerons :

- l'émergence d'un tissu très dynamique des entreprises privées qui ont investi massivement dans la production laitière et des produits laitiers. En effet, le secteur privé compte 172 PME/PMI réparties sur tout le territoire national. Ces entreprises sont orientées particulièrement dans la fabrication de produits laitiers (80% contre seulement 20% pour les laits de consommation).
- l'accroissement de la consommation globale du yaourt en Algérie, celle-ci s'élève à 13,7 kg par an et par habitant, alors qu'elle était de moins de 5kg en 2001, ce qui rend le marché algérien porteur, et a conduit en effet à l'accroissement du nombre d'intervenants et par conséquent, l'amplification de l'intensité concurrentielle.
- l'arrivée des firmes multinationales (l'implantation de groupe français Danone en Algérie en 2001 via une alliance avec une entreprise locale « Djurdjura », Yoplait via une franchise) a poussé le reste des entreprises privées, celles qui ont gardé la propriété familiale (Soummam, Hodna, Trèfle….etc.), de renforcer leur position compétitive en fournissant davantage d'efforts dans la communication et la segmentation fine des produits à travers l'innovation.

Tous ces facteurs ont créé plusieurs changements dans le secteur ce qui explique la forte tension concurrentielle et la rivalité inédite sur le secteur. A cet effet, ce constat place toutes les firmes dans le secteur dans l'obligation d'innover en permanence afin de créer la perturbation et le changement à leur avantage sous peine de se voir dépassées par la concurrence rude qui règne au sein de cette industrie. Le Directeur Commercial de Ramdy évoque cette réalité : *« L'intensité de la concurrence est très forte, elle sera plus forte durant les temps à venir ».*

Perturbation innovatrice et agressivité

Le secteur des PLF en Algérie est composé de quelques firmes de renom qui dominent le segment du yaourt. Le traitement des données démontre que le leader du marché est très agressif, car c'est lui qui a initié plusieurs actions radicales dans le secteur. Il a créé l'évènement concurrentiel (Ilinitchet al., 1996) choisissant l'axe de la modification conséquente de la valeur (c'est le premier qui a introduit le yaourt au 'gingembre', à la 'mandarine', ou encore à la 'noix de coco', 'aux biscuits'. Même en terme de design des pots, c'est le premier au niveau national qui a fait des 'pots noirs', dans le but d'attirer la curiosité des consommateurs). Grâce à cette politique stratégique initiative, Soummam a créé l'instabilité (D'Aveni, 1994) et par conséquent, il s'est emparé d'une très large gamme de produits exclusivement à lui. Il a

bénéficié ainsi, du « first mover advantage » (Makadok, 1998) et devenue la référence dans le marché de yaourt en pot.
Dans la mesure où les choix stratégiques du leader affectent l'ensemble des acteurs, toutes les entreprises dans l'industrie des PLF se trouvaient dans l'obligation de suivre le rythme d'agressivité et de rivalité. Le Cogérant de Ramdy, témoigne en ces termes : *« On est devant un géant, on doit suivre le rythme de Soummam et évoluer »*.

En effet, il ressort de notre recherche empirique que, DDA, Hodna et Ramdy ont toutes mené des attitudes agressives via des perturbations innovatrices. Premièrement, par rapport à DDA, d'après notre analyse, elle a fait émerger une nouvelle piste stratégique, en créant le segment du bifidus, prenant l'initiative de lancer pour la première fois en Algérie « l'Activia ». Suite à cette modification radicale de la valeur, DDA en tant que challenger a bousculé la domination qui régnait au sein du secteur en imposant ses propres règles du jeu, cette dernière étant devenue leader dans ce segment depuis 2004 à ce jour (Baden-Fuller et Stopford, 1994), elle en est à 95% de parts du marché. Ce produit est classé le premier en termes de vente avec plus de 3 milliards de dinars par rapport aux autres produits. À cette première série d'actions agressives s'ajoute une autre initiative nationale, cette fois concernant la variable commerciale. DDA a perturbé les règles du jeu concurrentiel à son avantage grâce à la modification radicale de sa chaîne de valeurs choisissant le maillon de commercialisation et de distribution comme une nouvelle piste concurrentielle. Elle a réussi à créer un déséquilibre en rationalisant ses ressources commerciales (Soummam utilise le triple de ce qu'utilise DDA). Ainsi, malgré que Soummam les dépasse de loin en termes de gamme de produit (36 références contre 8 références seulement de DDA), elle est parvenue à créer une symétrie en termes de présence sur les principales wilayas entre ses produits et les produits du leader. Cette perturbation innovatrice a permis à DDA d'être leader sur les grandes villes à 80%-90% de ses marques (Hamel and Prahalad, 1994). Le Responsable de Département Analyse des Ventes de DDA atteste par ces propos : *« On a la plus grande maîtrise de distribution sur le marché […]. C'est pour ça, je peux me permettre de dire qu'on est leader»*.

Secondement, Hodna-lait a su se démarquer des autres concurrents en choisissant le secteur du yaourt à boire comme un nouvel espace, prenant l'initiative d'introduire une nouvelle variable dans le jeu concurrentiel par la mise en œuvre sur le marché des yaourts à boire 100% lait cru, alors que les rivaux le font à base de lait en poudre (Sachant que tous les PLF en Algérie se préparent à base de lait de poudre). Malgré qu'elle est récente dans le marché, cette action agressive complètement originale en termes de proposition de valeur, lui a permis de faire face aux grands comme Soummam ou Trèfle qui sont plus anciens qu'elle dans ce segment. Suite à cette perturbatrice innovatrice, Hodna a bénéficié d'une préemption du marché (Lee et al., 2000), elle est actuellement à 80% de parts de marché au niveau national. Le Directeur de Production de Hodna lait affirme que : *«On est leader sur le territoire national, par ce qu'on avait un produit à base de lait de vache»*.

Troisièmement, Ramdy est le deuxième nouvel entrant, qui a réussi à pénétrer dans le marché du yaourt, il a choisi de se différencier à travers un comportement agressif vis-à-vis de la concurrence, en prenant une piste concurrentielle inexploitée à travers une proposition radicale de valeur via la production des yaourts en pot à base de lait (Baden-Fuller et Stopford, 1994 ; Kim et Mauborgne, 2005), alors que les autres acteurs font la spécialité laitière (c'est la substitution d'une partie de la poudre de lait par l'amidon, par conséquent, le produit perd sa valeur nutritive en calcium). Comme implication à cette perturbation innovatrice, Ramdy a bouleversé l'ordre établi en créant un nouveau segment où elle est la seule entreprise, sur le territoire national, qui fait du yaourt aux fruits et le yaourt mini-prix , ce qui lui a permis de bénéficier d'une régénération de l'activité et une extension du marché potentiel du yaourt en pot (Barker, 1992) traduit par une hausse de la rentabilité globale de l'activité engendrant à son avantage une augmentation de rendement avoisinant un taux d'évolution de 1219% pour l'année 2014 par rapport à 2009, et du coup, elle est devenue une référence du yaourt naturel au niveau national.

Enfin, le cas de Trèfle nous permettra d'étudier plus finement l'impact de l'absence d'agressivité et de la perturbation innovatrice. Le cas tire sa spécificité du comportement défensif de Trèfle face à la

concurrence. En effet, malgré qu'elle est la plus ancienne entreprise dans le secteur, elle ne prend pas d'initiatives pour innover et perturber le jeu. L'absence de l'agressivité et par conséquent de la perturbation innovatrice a engendré une décroissance totale de l'entreprise. Elle a été l'objet de manœuvres agressives et du coup, elle a perdu sa place de leader, dépassée par des concurrents récents dans le secteur. La rivalité inédite et l'absence de perturbation ont entraîné la disparition de l'opérateur, le début juin 2015, Trèfle a été absorbée par la concurrence, cédant toute l'activité de yaourt au profit de DDA (D'Aveni, 2001). L'agression et la perturbation innovatrice ont permis à Soummam d'être leader et de bénéficier d'une croissance perpétuelle, réalisant un taux d'évolution annuelle de plus de 15%, et ce, malgré la présence des firmes multinationales dans le secteur. Ainsi, ce comportement a permis aux restes des operateurs de bénéficier d'une croissance considérable en terme d'évolution de bénéfice et de chiffre d'affaire comme ainsi : (DDA : + 1507%, + 70.72% ; Hodna : + 11.14%, + 2134% et Ramdy : + 2468%, + 53969%), par contre l'inertie et l'adoption des attitudes défensives a engendré une détérioration de la croissance pour la firme passive (Trèfle). Ce qui confirme la performance des perturbations innovatrices.

L'objet de la réflexion engagée s'articule autour de la stratégie de perturbation et plus particulièrement en démontrant ses performances comme un choix stratégique indispensable dans un contexte à forte dynamique concurrentielle. Dans cette optique et en observant de façon rétrospective les comportements concurrentiels véhiculés par les operateurs dans le secteur et leurs implications, force est de constater que le la perturbation innovatrice est devenu une option stratégique vital pour les acteurs existants et pour les nouveau entrants. Nos résultats renforcent donc l'idée selon laquelle les acteurs ont intérêt à prendre part de façon active à la transgression des règles du jeu concurrentiel et des référents qui y sont associés (Chen et Miller, 1994). La quête de l'inertie, prescrite par Porter (1980), se trouve ici quelque peu contestée par les comportements des opérateurs au cours de la période étudiée.
Ce constat, nous amène a avancé au sens de D'Aveni (1994, 2001) , Le Roy (1998), que, qu'il s'agisse d'une firme déjà installée dans le marché ou nouvel entrant, dans un univers où la dynamique concurrentielle est forte et d'une incertitude intense, un comportement d'initiation des actions concurrentielles et des attitudes perturbatrices du statu quo sont des démarches stratégiques performantes pour tous les acteurs, car c'est le seul moyen qui leur garantit la survie et la croissance qu'ils ont cherché ou recherchent encore. Le tableau III illustre les fondements de la perturbation innovatrice ainsi que ses implications pour les 5 études de cas.

Conclusion

L'objet de cette recherche résidait dans la volonté d'approfondir la connaissance sur la stratégie de la perturbation innovatrice et d'apporter des éclairages concrets sur la mise en œuvre et les clés de réussite. Une approche théorique principale a été mobilisée : le courant de la dynamique concurrentielle *(« competitive dynamics »* Baum et Korn, 1996; Chen et Miller, 1994; Bensebaa, 2000 ; Lee et al. 2000; Young et al., 2000).
Dans cette logique, nous nous sommes intéressés plus précisément aux comportements stratégiques dans le secteur des PLF en Algérie. En effet, ce contexte concurrentiel a connu la multiplicité des entreprises, qu'elles soient nationales ou multinationales, ce qui a conduit à la croissance du niveau de rivalité, d'où l'apparition des perturbations innovatrices des règles du jeu concurrentiel. L'étude longitudinale menée au niveau de ce secteur entre 1996 et 2015 offre deux apports principaux :

- Premièrement, l'intensification de la concurrence conduit les entreprises à la redéfinition du statu quo, et ce choix stratégique s'impose à toutes les entreprises. De ce point de vue, la perturbation innovatrice, qui s'inscrit dans cette vision, constitue une source de l'avantage concurrentiel. A posteriori, d'abord la performance des 4 opérateurs agressifs dont Soummam, DDA, Hodna et Ramdy, au cours de la séquence, s'explique par l'adoption de ce comportement, ce qui a permis même à ces acteurs d'être leaders dans le segment où la perturbation a eu lieu. En outre, la décroissance de l'acteur passif, à l'image de Trèfle, qui a préféré l'inertie a eu comme effet

l'absorption par la concurrence et la disparition du secteur en dépit de sa position de précurseur dans la production nationale du yaourt.

- Deuxièmement, le point de départ de notre recherche consistait à mieux comprendre la perturbation innovatrice. Définie comme une nouvelle initiative stratégique qui repose ici sur deux sources principales : modification radicale de la valeur et/ou de l'architecture de valeur, qui sert à construire un nouveau business model à travers la création d'un nouvel espace stratégique. Cette stratégie relève, en effet, d'un intérêt majeur, que ce soit pour les acteurs existants comme le cas de Soummam et DDA ou pour les nouveaux acteurs à l'instar de Ramdy et Hodna si nous considérons les gains enregistrés pour les deux types d'acteurs.

Les résultats obtenus ne peuvent être compris que relativement aux limites de l'étude. Cette recherche possède certaines limites inhérentes au caractère empirique de notre recherche. La première limite s'apparente au secteur, les PLF, bien qu'il apparaisse comme un champ d'étude correspondant parfaitement à la problématique et à l'objectif de notre recherche, il nous paraît souhaitable d'entreprendre une étude comparative avec le même secteur d'un autre pays. L'introduction d'une analyse de même secteur d'un pays étranger permettrait de généraliser les résultats de notre recherche. La seconde limite a trait au fait que notre recherche s'appuie uniquement sur les informations recueillies auprès des responsables de chaque entreprise. Or, la prise en considération des points de vue d'autres acteurs externes dont les distributeurs, les grossistes et les superviseurs consoliderait certainement nos résultats. Comme nous ne pouvons pas éliminer ce biais potentiel, de futures recherches seraient susceptibles d'accroître la diversité des points de vue. En définitive, la recherche sur la dynamique concurrentielle et la perturbation innovatrice étant nouvelle, elle demeure largement au stade exploratoire. Elle ouvre la voie à d'autres travaux sur une échelle plus large et des moyens plus élaborés.

Abstract

In this paper, we will focus on the study of features accounting leases in economically developed countries. We will examine the problem of definition in the accounting legislation such categories as financial and operational leasing. The logic of this division is considered, explanations for criteria of financial lease are offered. We will study the prospects for change in the current accounting legislation on lease in internationally recognized financial statement's formats. The need for these changes is dictated by the project of convergence of accounting systems, currently being implemented under the auspices of the International Federation of Accountants (IFAC). In this case different ways of the decision of the specified problems are offered. We will show the accounting lease evolution from US Accounting Research bulletins in 1930s to new International Financial Reporting Standard 16 Leases, which was adopted in January 2016.

Key words: corporate reporting, professional accounting institutions, leasing, financial lease, operational lease, IFRS, GAAP, comparability

Introduction

Lease (leasing) operations gained enough widespread in modern business. Despite the seeming simplicity of these operations, it is impossible not to note the existence of a large complex of methodological problems in the field of interpretation, classification and accounting for lease transactions. In particular, in the decades before the scientific and professional communities was relatively easy task of correlating real economic essence of rent with its formalized representation in civil legislation. Of course, a peculiar leader in the development of accounting support of lease transactions were and are the American scientific community and the business environment. Their experience in the field of interpretation and lease accounting are widely recognized throughout the world; moreover, the American experts formulated the ideas and principles of lease accounting which served as a methodological basis for the development of appropriate standards used in international practice. Of course, in many respects, this fact was dictated by the certain that the US rental service is the most developed and powerful in the world in every way, but we must also note about deeply-developed system of methodological support of leasing operations in American accounting legislation. In this article we will discuss the development of complex accounting software of rentals in the US, and later in the world.

Accounting lease legislation has always been a certain contentious issues in accounting and financial practices of different countries. Discussions were subjected to classification of leases and their symptoms, the reflection of different types of leases in the accounting, methods of correlation approaches in the treatment of domestic and international recognition of the lease (in particular with the approaches, adopted International financial reporting standards (IFRS) or generally accepted accounting principles (GAAP)). In particular, as a general rule, ownership was a defining feature in the recognition of an asset in the balance sheet. In this regard, the leased property should be taken into account on the balance sheet of the owner, ie the lessor. But now if we turn to the practice of current IFRS, we see another fundamental approach in the recognition of assets – asset is a resource controlled by the entity as a result of past events and from which future economic benefits are expected to flow to the entity.

Despite the apparent variety, accounting standards in most countries with certain reservations identified two broad categories of rent – financial and operating leases. Accounting problems in the area of rental operations arise primarily from a financial lease. Currently, a single, universal set of criteria for the classification of lease transactions in the global accounting practice does not exist.

Blake, Amat (1993) concludes that each country with national accounting legislation treats different classification features leases, but in general, if we look at the regulators devoted to rent, we can identify a definite trend. Its essence lies in the fact that the classification of the lease is necessary to take into account the economic content of the certain operation. Under normal operation the lease can be understood, when the owner, for any reason, does not use his existing property, and therefore prefers to give it out to get at least some benefit, and (or) at least partially recoup their investment costs. Background finance lease is different - it's more targeted investment and the operation of a financial nature.

In general we can say that a finance lease is defined as a form of financing of asset's acquisition by the lessee, i.e. the so-called «hidden purchase» when the tenant is not formally being the owner of the property during its lifetime, using the property for its own purposes, offsetting the cost of payments to the lessor the leased object (Lewis, Pendrill, 2004, p.216).

The study used a range of scientific methods (observation, comparison, grouping, abstraction, analysis and synthesis, induction and deduction, historical and logical methods).

The history of the accounting lease legislation

Looking in retrospect the evolution of accounting legislation on rent, it should be noted that much of the ideologists of modern interpretations of the lease in terms of its classification and accounting were American scholars and practitioners. They justified the logic of allocating financial and operating leases, and that their achievements have been used in the development of International accounting standard (IAS 17, Leases).

The starting point in the interpretation of the logic of lease transactions is to understand the principles of construction of balance sheet. There are two alternatives for the formation of an asset: (a) the ownership of the property (balance sheet reflects only those assets, ownership of which belongs to the economic entity) and (b) control function (balance sheet reflects the resources controlled by an entity which has revenues on their use, although it has no right of ownership to them). Historically dominated the first variant. In some countries (such as the Soviet Union and, until recently, Russia) ownership is a determinant in the choice of balance. Causes of this approach have been described in detail in the study Sokolov, Kovalev (1996). In the 30-ies. the last century due to the expansion and re-interpretation of the practice of business operations, it became a subject to criticism in the American financial environment. In 1938, the US accounting legislation[1] mentioned capitalization object rent tenant reported (IASB, 2007, p.2). It certainly was not any rental transactions, but only on long-term contracts. The Bulletin ARB 38 mentioned the desirability of disclosure obligations of the lessee for long term rentals over the life of the transaction. It was assumed that the tenant can do this in a fairly arbitrary manner.

In the mid-60s. twentieth century US lease transactions received peculiar rebirth. From the standpoint of the lessor's lease was perceived not as a kind of compulsory measure (the property is rented, because I did not find the proper application of the owner), but as a deliberate business activities for the purchase of property and renting it. From the perspective of the tenant lease transactions began to be viewed as a long-term source of funding on a par with bonds.

It was at this time when in professional accounting and financial community began to talk about the issue of so-called transactions "off-balance sheet financing», when firms instead of buying assets prefer to take them in rent (Zeff, 1999, p. 9). Recommendations for reflection tenant lease obligations are not always respected, in addition, firms often veil the real terms of the lease of succes-

[1] For 20 years (from 1938 to 1959) Special Committee on Accounting Procedure of the American Institute of Accountants (AIA) released the so-called Accounting Research Bulletin (ARB), dedicated to the various accounting matters. With some degree of conditionality, these papers can be considered prototypes of modern accounting standards. To rent was devoted to ARB 38 «Disclosure of long-term lease contracts in the lessee's financial statements». Learn more about professional associations practicing accountants in the United States in The History of Accounting (1996).

sive short-term contracts. In 1962, the American Institute of Certified Public Accountants (AICPA) published a study in which on the basis of information about the market of leased assets for the first time noted the need to consider all of the leased property to the lessee's balance sheet, regardless of the terms of the transaction (IASB, 2007, p. 9). Directly by the author of this research material was professor John Mayers[2]. It is obvious that there are no mandatory guidelines of this study, but it is actually anticipated the current trend in the change of regulators rental - the need for full disclosure of all liabilities and controlled assets, implying a capitalization of the leased object.

In the following discussion regarding the classification and accounting for lease transactions in American professional community has been reduced to the delimitation of lease transactions into two groups - the financial and operating. For the first time the need to introduce specific criteria by which one can identify a finance lease, spoke at the end of the 60s. In 1972, the Board of Accounting Principles (APB) AICPA[3] has issued a special report-study (Opinion[4]) № 27 «Accounting for Lease Transactions by Manufacturer or Dealer Lessors», in which these criteria were formulated. In general terms, they are almost identical to the existing criteria as the current system US GAAP, as well as in IFRS.

The process of obtaining US accounting regulators lease was logically completed in 1975, when the Financial Accounting Standards Board (FASB) has issued a draft accounting standard on leases, which in general, and was put into effect in 1976 under the name of SFAS 13 (Accounting for Lease, Statement of Financial Accounting Standard 13). Developments of American professional accounting community have been used in the international practice. In October 1980 the International Accounting Standards Committee (IASC[5]) issued a preliminary document for discussion dedicated to the interpretation and integration of lease transactions, which largely repeated the American standard. For two years (1981 and 1982) in the professional community was a process of discussion of this document[6], and finally, in 1982, was published the final version of IAS 17 Accounting for Leases. The standard was put into effect on January 1, 1984. In 1997 a new version of the standard with a slightly modified name of IAS 17 Leases.

Total beginning from 40-ies of the last century in the US, and subsequently the international accounting environment were released about 50 of various regulators (standards, projects, papers, research reports, etc.) directly or indirectly to the accounting of lease operations. The table below reflects only some of the most important documents, and a complete list can be found in Dye, Glover and Sunder (2015).

[2] Professor John Myers has taught at Northwestern University in Illinois, and has been a practicing accountant and auditor in the company «Arthur Andersen». Professor Myers died in 1993 at age 78.

[3] Board lasted until 1973, when its functions were transferred to the Financial Accounting Standards Board (FASB).

[4] The literal translation into other languages of the document – «opinion» should not confuse the reader. Appearing in the American system of accounting professional institutions are not vested with authority. Produced documents they are advisory, but their appearance is usually preceded by an active discussion in the scientific community and the business environment. Therefore, under the vague term "opinion" actually refers to some advice on accounting, which adopted major players in the business. Of course, each company in principle is not obliged to follow them, but it was the fact that most companies perform these recommendations contributes to the dissemination and implementation of the provisions set forth in these documents.

[5] In 2001 the Committee was renamed the International Accounting Standards Board (IASB).

[6] The procedure for the adoption of accounting standards in the US and international accounting practices, is fundamentally different from the corresponding procedures in the countries of the so-called continental accounting. Professional accounting institutes publish preliminary versions of the standards, and then for some time, collect all comments and corrections to them, to continue to take some revised versions, often by voting members of the Committees of the procedure.

Table 1: Lease accounting standards

Year	Author	Doc	Title
1966	APB	APB Opinion 7	Accounting for Leases in Financial statements of Lessors
1972	APB	APB Opinion 27	Accounting for Lease Transactions by Manufacturer or Dealer Lessors
1973	SEC	ASR 132	Reporting of Leases in Financial Statements of Lessees
1973	SEC	ASR 141	Interpretations and Minor Amendments Applicable to Certain Revisions of Regulation S-X
1973	APB	APB Opinion 31	Disclosure of Lease Commitments by Lessees
1978	FASB	FASB Interpretation 21	Accounting for Leases in a Business Combination
1978	FASB	FASB Interpretation 23	Leases of Certain Property Owned by a Government Unit or Authority
1978	FASB	FASB Interpretation 24	Leases Involving only a Part of a Building
1978	FASB	FASB Interpretation 26	Accounting for Purchase of a Leased Asset by the Lessee During the Term of the Lease
1978	FASB	FASB Interpretation 27	Accounting for a Loss on a Sublease
1980	IASC	ED (E19)	Accounting for Leases
1982	IASC	IAS 17	Accounting for Leases
1997	IASC	ED (E56)	Leases
1997	IASC	IAS 17 (revised)	Leases
2003	IASB	IAS 17 (revised)	Leases
2009	FASB/IASB	Discussion Paper	Leases: Preliminary Views
2010 - 2015	FASB/IASB	Proposed Standards Update	Proposed Accounting Standards Update—Leases
2016	IASB	IFRS 16	Leases

These data allow us to get at least a general idea of the efforts that have been made to create a regulatory and methodological support, at first glance, is not the most technically complicated operation such as the operation of the lease. An analysis of documents shows the existed in the US and international accounting practice, the trend aimed at raising awareness of external users of financial statements with respect to the participants of the lease. All the proposed changes, one way or another, affect and touch-sensitive liabilities reflect tenant when renting, which obviously fits into the general trend of change in the target destination of Accounting and Reporting, namely, the transition from the control and analytical accounting functions to information and communication.

Comparative analysis of financial and operating leases in accounting

It should be noted that an international approach to the classification and accounting of lease transactions, which in a sense is expressed in IFRS always kept separate mention of the lease, in particular, it has been subject of a separate accounting standard (first accounting standard about lease in IFRS has been introduced from 1 January 1984). To determine the financial lease in IFRS take into account the distribution of risks in the lease transaction, a finance lease is recognized, provided that

the agreement transfer substantially all the risks and rewards associated with ownership of an asset from the lessor to the lessee (Iasplus.com, 2016).

As already mentioned finance lease is defined as a form of financing of acquisition of the asset by the lessee, in particular it can be called «hidden purchase», the tenant, is not formally being the owner of the property during its lifetime using the property for its own purposes, offsetting the cost of payments to the lessor the object of the lease. Of course, the term «hidden purchase» is not quite correct because it does not characterize the entire set of relations that arise between the landlord and the tenant, and, moreover, in a sense, is wrong, because we are not talking about the actual transfer of ownership to the lessee. Nevertheless, it is quite convenient for understanding the current operations.

Interpretations of financial lease in various countries may differ significantly from each other. For instance, in US GAAP finance lease is divided into two types - direct finance lease and sales-type lease. Direct financing lease is an agreement when the future tenant needs some property, but does not have to purchase its free financial resources or do not wish to purchase it at any other reason. Then he finds a specialized leasing company, which according to his application to acquire ownership of the property, and then transmits it to the temporary possession and use of the lessee for a fee. In this situation, we have a particular transaction which involves three parties: the seller of the property, the buyer-lessor and the lessee. Potential tenant wants to get a property from a particular seller, and contract with a specialized leasing company which acquires the property and leases it. In this transaction leasing company generates revenue from the lease of property.

If a potential lessor is also the seller of the property, the transaction is called sales-type lease. It involves two participants - manufacturer or seller of the property (lessor) and lessee. In this transaction seller's revenues consist of income from the sale of the leased object (book value) and rental income. More information about direct financial lease can be found in (Welsh, Zlatkovich, 1989, p.1052).

If we turn to the IFRS we do not find there such detailed classification of financial lease (direct financing and sales-type), although the principles of rent division into financial and operational in IFRS and GAAP are the same. Detailed comparison between approaches in accounting for the lease in accordance with GAAP and IFRS can be found in (Bloomer, 1996, pp.237-258).

Thus, based on the separation of transactions on the financial and operating lease is, above all, the risk category in relation to the subject of the lease. In fact, if the lease agreement allows us to speak about the transfer of all of the benefits and risks of the use and possession of property of the other party, the transaction has features that allow you to bring it out of the category of normal rent.

Formally, having no right of ownership, the owner acts as a kind of «economic owner» of the subject of the transaction. The economic owner is the person that formally has no legal ownership of the asset, but it owns all of the risks and benefits from this asset. The annex to the modern accounting, this situation is entirely subject to the one of the fundamental principles of his – substance over form. On the one hand deal on its face, is the rent and the owner of the leased property is uniquely determined – it is the property owner. On the other hand the economic characteristics or conditions of the agreement are such that it is the tenant has all the benefits of the use of the subject and bears all the risks of ownership.

In practice, the legal owner of the leased property may not even care about the subsequent fate of the legal subject of the lease. For him, the meaning of the transaction is to obtain a distributed time income from the investment in the property. In many ways, this situation with finding new ways to implement began to develop when the manufacturing companies of any property had difficulty selling their products (meaning no raw materials, and objects relating accordance with the accounting classification of the buyer of non-current assets). In addition, the property can be quite costly, which also imposes certain problems in its implementation. In this regard, and there were other types of transactions, implying deferred cash payments, but with the preservation of the manufacturer of the legal control of the realizable property. It is important to understand that a finance lease transaction is

basically just involves the transfer of property to the tenant, but from a legal point of view, it is not considered a sale. Nevertheless, the economic substance of the transaction is to compensate the owner of the entire value of the property and the payment of certain lease fee for the temporary installment payments. In a sense, this deal is very similar to the implementation of any object by installments, with the only difference being that the title to a certain time is not passed on to some reasons.

Definition of financial lease's liabilities

In addition to defining the phenomenon of a finance lease, we must also try to bring his assessment, i.e. identify a set of criteria to separate a specific economic situation of finance lease transaction. Currently single, absolutely identical number of criteria for the classification of lease transactions in the global accounting practice does not exist, however, is basically the criteria set forth in the IFRS that best define the key points of discharge operations finance leases. The logic of occurrence of each criterion is well considered in the modern scientific and educational literature (e.g. (Kieso, Weygandt and Warfield, 2011, pp.1121-1122)), so just concentrate on the key factor classification.

Fundamentally, from an economic point of view, all the criteria are general aggravating circumstances – in fact there is a veil the implementation of the leased property to the lessee, in particular, the amount received by the lessor from the lease of property, at least comparable to (or more likely, greater than) the sum of the costs lessor's acquisition or creation of the said property. Legally, an indication of the implementation, of course, cannot be spelled out in the lease agreement, as this will immediately change the actual definition of the contract. In addition, one of the aggravating circumstances of a finance lease in accordance with IFRS for the transfer of ownership at the end of the transaction, from a formal point of view, does not mention anything about the economic underpinnings of the operation. However, under conditions of freedom of contract and taking into account transactions of a commercial nature transfer of ownership of property in the general order must be accompanied by a certain cash flow yield in excess of the company's expenses related to the emergence of the object on the balance sheet. Of course, in the presence of affiliated parties in the transaction, this rule may be waived, however, civil law does not accidentally contain sufficiently clear guidance on the need to respect the principle of commercial entities in the relationship.

Currently, the professional accounting community discusses recycling provisions of IFRS 17 «Accounting for Lease» (e.g. Lease accounting, 2013). Existed for a long time division rent into financial and operating was also accompanied by clear instructions regarding the balance sheet the leased property (under finance leases – lessee, when operating – the landlord), as well as in the methods of revenue recognition in the case of a finance lease (use discounting mechanism for determining the value revenue in each period). It should be noted that virtually all of the problems of delineation and lease accounting emerged from the discussion on the following key issues – and whether the lessee's balance sheet to reflect the full amount of its obligations under the lease.

Possible changes in accounting for financial leases

Formal consideration of the object of rent for the balance of the tenant may run counter to the economic substance of the transaction, as to some extent hides the actual level of the financial company's dependence on foreign investors. This technique veiling the real financial situation is very actively used by many companies: they provide to its shareholders and potential investors balances with very satisfactory structure of sources of funds, but the actual level of financial dependence could be quite high, if not critical. In many countries, such practices are not excluded, and still. Demonstration of the reality of the level of financial dependence is important, not from the position of the anchor is to lease transactions, but, above all, from the perspective of the feasibility of fiscal policy as a whole, since, for example, any operation to attract long-term funding sources (issue of shares, obtaining long-term loan or banking loan) obviously directly linked to the actual capital structure.

It is in order to eliminate such misunderstandings and reflection lease transactions in accordance with their economic nature of the accounting standards of most countries has been fixed capitalization requirement under finance leases by the lessee (i.e., the reflection on the balance sheet), and one way or another have been identified a situation where the rental transaction is treated as a finance lease. However, to completely eliminate these contradictions are not managed, many companies continue to execute and execute leases as operating lease transactions. *The current international account-*

ing practice is actually moving to ensure that recognize the need to completely abandon the possibility of taking into account the subject of a long-term lease on the balance sheet of the owner – the property owner. This trend is entirely fit into the mainstream ideology of IFRS on the recognition of assets, only on the right of control, and leveling civil features of their selection. Currently, the IASB and FASB, engaged in the process of convergence of IFRS and GAAP models, noted the need to take into account all obligations under leases the tenant in the balance sheet (actually this is the capitalization of the leased item is taken into account).

Division rental types, methods of accounting interest income, depreciation methods, and so on, of course, will be important in accounting practice. However, the basic framework of the essential records of lease agreements - common approach to the identification of assets and liabilities of parties to the transaction when renting (capitalization of the leased asset by the lessee with the relevant disclosure obligations in liabilities is precisely the core logic of the last professional discussion (rental in IFRS and GAAP).

However, the availability of sufficiently defined criteria division leases does not contribute to the full resolution of conflicts in terms of accounting. Analyzing the evolution of accounting regulators for lease in the 30-s of the last century, it is easy to discern trends in the adoption of a number of key changes. Innovations in the area of trying to take in order to demonstrate to the statements of the tenant leased assets and associated liabilities. The key idea is to accept the changes - the company must show the actual financing of their activities, and public reporting should contain a list of all the resources that are controlled by the company. Implementation in the US in the lease accounting standard with the system criteria for its division seemed theorists and practitioners of accounting sufficient condition for the correct reporting of assets and liabilities on the basis of their economic nature.

Nevertheless, the international accounting practices in in 80-90th years of the last century showed that the question of veiling the financial situation of the tenant has not been resolved, and the recognition and consolidation of the part of the lease transactions of the term "financial" was actually a kind of palliative measure. We cannot exclude the existence of a bona fide nature of certain financial conflicts (hardly justified and appropriate to assume that absolutely all the companies are trying to hide the amount of liabilities and all assets related to finance leases, include operating lease). Many companies continue to execute and execute transactions on operating leases are entirely legitimate, but a comparison of the extent of different types of lease allows you to doubt the correctness of the current delimitation. For example, in a research report IFRS in August 2014 was given an interesting statistic. In particular, one of the UK's largest retailers, the company «Woolworths» (UK) for the last 5 years has taken operating leases property in the amount of $ 2.4 billion. While its balance sheet was reflected in the average debt for lease totaling 147 million dollars (Project Update: Leases, 2014). Moreover, the reader can find many examples of such "disparities" in the absolute numbers of transactions of financial and operating leases. For example, in the annual report of the company «Royal Dutch Shell» for 2014 is available for information on obligations under finance leases and operating leases, which are, respectively, 6.7 and 31.1 billion dollars. (Royal Dutch Shell, 2014). With regard to the present situation of the management of the company «Royal Dutch Shell» considered it necessary to reflect in its annual report information on operating lease, which is not always revealed, even very large public companies.

In connection with the collision in the international accounting community has repeatedly raised on the adjustment of the existing order of lease accounting. The beginning of this process was, of course, in the works of a number of scholars and practitioners in the field of accounting and analysis. In particular, in the 90s of the last century some American financial analysts have expressed the need for capitalization of the leased asset and demonstrate all the obligations of the tenant under lease to increase the reliability of financial reporting (e.g. Knutson, 1993 and McGregor, 1996).

The debate in the scientific and professional accounting environment in the 90s led to increasingly strengthens the position of the supporters of a complete renunciation of the possibility of taking

into account the subject of the lease on the balance sheet of the owner[7]. Currently, IASB and FASB, working together to implement the process of convergence of accounting models specified by IFRS and GAAP, noted the need to reflect all lease obligations on the balance sheet of the lessee. Moreover, in the release of a new standard on lease, the tenant is called directly by the buyer, the seller and the lessor, highlighting the obvious similarities of economic processes in renting and buying and selling.

Said process of change in the current rules of accounting of lease operations actually started in 2006 when the IASB and FASB announced the launch of a joint project to improve the accounting of lease operations. As follows from the teaching materials IFRS, initially it was only a cosmetic change in the standard IAS 17, but over time the developers started to talk about fundamental change in the classification and the accounting for leases. In particular, in May 2013 IASB published the first systematic list of changes that are planned to be implemented in the new version of the standard (Exposure Draft, 2013). The following year, in March 2014, was released a new version of a number of changes based on comments received to the address of the business environment and the scientific community. Finally, in February 2015 it released the latest version to date of planned change (but still not the standard!) (Project Update: Leases, 2015), and in October 2015 a special newsletter dedicated to the terminology used in rental operations (glossary) (Project Update Definition, 2015). Finally, in January, 13, 2016 IASB announced and issued a new accounting standard, called IFRS 16 Leases. It replaces accounting requirements introduced more than 30 years ago that are no longer considered fit for purpose and is a major revision of the way in which companies account for leases. The mainstream of the standard is the capitalization of the leased property by the tenant.

Conclusion

It should be noted that in some countries (e.g. Russia) lease transactions accounting procedures were radically different from the IFRS standards. The reasons for these discrepancies are described in detail in Kovalev (2014). However, it is necessary to articulate a very optimistic development trend of the russian system of accounting legislation. Even very conservative accounting countries adapt their national accounting standards in accordance with the provisions of IFRS. More details of this trend are described in Generalova N, Soboleva G, Sokolova N. (2015). Draft of the new lease standard introduced by the Russian Ministry of Finance is fully in line with the recent discussion between the International Accounting Standards Board and the Financial Accounting Standards Board (USA).

Discussion only the order is subject to cancellation of the leased item, i.e. in a certain sense, the technical issues associated with the definition of depreciation methods. The adoption of these changes actually lead to the fact that the issues of division of financial and operating leases in this way lose their exclusive urgency – *any subject of the lease the tenant and the respective obligations under the contract should be reflected in the lessee's balance sheet.* Selected issues relating to methods of charging depreciation improper tenant property, the procedure for determining interest income, etc., will undoubtedly be differentiated according to the terms of the contract. However, there is a substantial reform of the entire system of accounting for lease. The core design innovations – a capitalization of the leased property at the tenant. The adoption of these provisions is aimed at increasing the reliability of the reporting of assets and liabilities in the financial statements of the company. The changes in new lease legislation were announced in 2014 (Project Update, 2014) and final version of the standard IFRS 16 Leases was presented in January 2016. IFRS 16 is effective from 1 January 2019.

[7] It may be noted a certain vision of American researchers in the 60s of the last century (we are talking about the already mentioned work of Professor John. Myers) in respect of the lease. In particular, one of the arguments capitalization is the following fact: the existence of any separation criteria rent financial and operating company will provoke any legal ways to circumvent these restrictions for a certain veiling their obligations. The capitalization of the leased property by the lessee is the only possible way out of this situation.

Owner Family: Critical Success Factor for the Success of Business Succession in Family Owned Companies

A. Chamaru De Alwis
Department of Human Recourse Management,
University of Kelaniya, Kelaniya, Sri Lanka
dealwisac@gmail.com, chamaru@kln,ac,lk

Abstract

The foremost purpose of this research was to evaluate the level of influence coming from owner family on business succession processes in various successor modes. The targeted population was selected were the successors of family owned businesses that contain between 50 and 149 employees and who were involved in a business succession process within the last 10 years. Sample units were selected through simple random sampling method and consist of 128 units. The main data collection modes were a structured research questionnaire mail-out, and also in-depth discussions held on successors. All factors have a positive relationship to Initial satisfaction in Business Succession Process. However, the relatively important factor is family harmony. When succession is conducted with family member successors, the most important factor for success is family harmony. In practice business succession process encourages stakeholders to work for higher levels of satisfaction for the successor. Furthermore, the study recognizes Unrelated Manager Successor as a suitable alternative succession mode for family owned business.

Keywords: Owner Family, Business Succession, Satisfaction, business Performance

Background of the Study

When the incumbent is getting close to retirement, the Family Owned Business (FOB) and the owner-family is in a dilemma about the new successor appointment, and the success after the new appointment. If this process fails, that occurs just occasionally, it is the biggest loss in the entire life of the business entity. It is clearly not a regular incident in these generic types of businesses. Succession in FOB usually means one generation handing management to the next generation.

If one or few families have the majority of ownership and the controlling power of the company, then simply it can be identified as a FOB (Shanker and Astrachan,1996). Astrachan et al (2002) developed a new model for assessing to what extent family influence has on business organizations, using three dimensional powers, experience, and culture. Klein et al (2005), developed another scale named “F-PEC” to measure family influence on power, experience, and culture within a firm. Chrisman et al (2003), defined FOBs based on “familiness” which is current and next generation business control of a firm. Carsrud (1994), defined FOBs as when “A firm’s ownership and policymaking are dominated by members of an ‘emotional kinship group’ whether members of that group recognize the fact or not.”

Globally, FOBs are the prevalent form of business organizations, and they represent 60% to 75% of all worldwide enterprises - from the most developed countries to developing countries. However according to Ward (1987); Davis and Harveston (1998); and Kets de Vries (1993) “only 30% of FOB survive into the second generation, and 15% survive into the third generation.” As per Miller et al (2003) poor Business Succession Process (BSP) is the central cause for this and factor behind this failure is stakeholders influence is one of the factor to the unsuccessful BSP. Successor, Incumbent and Owner family are the most influential stakeholders for the succession process (De Alwis, 2012).

As a group, family members are the most important internal stakeholders in FOBs because the successor must continually deal with families in financial and social transactions (Sharma et al., 2001) throughout succession process and after. Therefore successful continuation of the business, family managers must accept each other's role, and if they reject the successor, it hurts to the entire BSP.

If owner-family act against the BSP, it will block the entire process of the BSP (De Massis et al., 2008; Lansberg, 1983). The challenges running the business for the successor are somewhat complex, especially when family members have different expectations for what they must do for the FOB. For instance, some family members may be directly involved with the FOB, and some not. However, all of them may have hidden or open expectations of goals for the FOB. The worst situation happens when the successor cannot accomplish those expectations from other family members, and then family members will go against the BSP as well as the successor. This encourage to appoint an outsider as a successor. Therefore their commitment, trust and agreement to work is very important for a successful BSP.

Churchill and Hatten, (1987) believed that family harmony helps the succession process be successful because it brings great trust and mutual understanding among participants (Dyer, 1986 and Handler, 1990). Malone (1989) included mutual respect, trust, understanding among family members, and the presence of open lines of communication as the main features to help family harmony. This brings a shared vision for their future (Sharma, 2001).Further, Morris et al. (1997) confirmed that the quality of family relationships is a reliable indicator of whether a BSP will be successful, more reliable than either succession planning or preparing heirs. If there is family disharmony, it will badly affect the business such as discontinuing business involvement, put family stakes into jeopardy, and cause stakeholder powers to be dysfunctional. Those badly affected must still attempt to successfully continue on with the business. If the family chooses not to continue the FOB, the BSP cannot be seen to implement this decision. In some instances, children of the owner do not have any interest to join the FOB due to various reasons because family relationships are complex and people conflict with each other, which then damages the continuity of the business.

According to research findings, FOBs give foremost preference to hand over the business to family members because their ambition is to preserve family company ownership. To achieve this, they transfer management and control to the next generation (Morris et al., 1997; Lansberg, 1999), without considering the level of competence of the successor. The leading argument for this generational succession is the belief that family members can gather social capital, resources and specific knowledge on running the firm in a more efficient and profitable manner (Bjuggren and Sund, 2001). According to Davis et al (1997) "the family successor could perform better than other managers because they are exposed to higher non-monetary rewards associated with the firms' success that other successors do not share." They further argue "to get solid, specific knowledge and high levels of trust from key stakeholders is very difficult to outsiders."

However due to the failures with family successor, BSPs have gone beyond that stage by considering alternative succession modes, not for family control but for the survival of the organization as a FOB. Nelton (1997) expressed that "families are now starting to recognize that it is not the end of the family enterprise if you bring in a non-family executive to lead the firm". In other words, at present there is a trend to be a FOB as a "family owned - non-family managed" model, not as a "family owned-family managed" model. Therefore, the business succession process of FOBs is better defined as "the passing of the leadership baton from the founder/owner or incumbent owner to a competent successor, who will be either a Family Member Successor (FMS) or a non-family Unrelated Manager Successor (UMS) (De Alwis, 2011)."This paper defined FMS as "individuals who have a relationship with the incumbent and family by blood or by law (De Alwis 2012)." In general, the transition will come from generation to generation, but sometimes, due to the unavailability of blood relations; there is consideration given to whether the business should be handed over to more distant, legally

binding relations. Thus, this study considers both types of successors. The adoption of UMS signifies the separation of ownership and control, or at least it dilutes the family control in the actual management of the business. Under these circumstances, the UMS is defined in this paper as "an individual who takes full charge of the day-to-day operations while retreating to the board of directors to assume advisory and supervising duties (De Alwis 2012)."

A successful changeover is extremely dependant on two foremost decisions. The first one is choosing the appropriate successor, and the second one is managing influential factors so as to maximise successor satisfaction because this directly affects PSP of the business unit. Under these circumstances, the author was in a conceptual puzzle: What are the family related factors influencing successful business succession process, and so on. Finally, this motivated the author to conduct empirical study to investigate that question.

Research Problem

As explained previously, BSPs of FOBs have become a serious issue for the longevity of this business entity. Therefore, there is a high tendency among researchers and practitioners to find feasible solutions to this succession issue, however in FOB literature; no one has researched owner family influences under the same conditions with different succession alternatives. This study aims to develop an understanding of this phenomenon, identified in the previous section. Hence, the research problem can be stated as follows:

"What are the influences from owner family members on a successful business succession of a family owned business in generally and under alternative type of succession modes? How is the influence different with each type of succession mode?"
The aim of this study is to examine the influence of owner family member's related factors to the success of the BSP under different succession modes.

Therefore, the objective is:

i. To compare influences from owner family relevant factors of the BSP with different successor modes: family members and non-family unrelated managers.

Study Design

Conceptual framework

This conceptual framework has identified family related factors of the BSP as the independent variables and the Post Succession Business Performance (PSBP) and Initial Satisfaction on Business Succession Process (ISBSP) as dependent variables of the study.

Independent variables

- Family Harmony

The factors carrying a high level of influence on the BSP include family members' commitments to the business (Dyck et al., 2002); their trust in the successor's capabilities (Dyck et al., 2002; Sharma, 1997; Sharma et al., 2001); and their mutual agreement to accept the new successor and continue the business (Sharma et al., 2003). Churchill and Hatten (1987); Dyer (1986); Handler (1990) all identified the combination of these qualities as increasing family harmony, and this generates a shared vision for every participant (Sharma et al., 2001). This study defines family harmony as "the level of trust, commitment to business and mutual agreement among family members." Therefore, this study was measured "family harmony" through three indicators: "trust, commitment to the business", and "mutual agreement."

- Willingness to support succession process

According to Tagiuri and Davis (1992), “an overlapping and interdependent relationship can be seen between the FOB, the owners of the business, and the family that controls the business.” If family members are not committed to the succession, it blocks the opportunity to demonstrate the requisite management abilities of the successor (De Massis et al., 2008). Moreover, most frequently, family members are more willing to offer higher positions to their relatives than to outsiders. In addition, they should be very willing to share their knowledge and portfolio of professional capabilities with relatives. However, in some instances, family members that hold important roles in the company may threaten to leave the company because of dissatisfaction with the selection. Under this background, this study defines family member’s willingness to the successor as “how much family members conform to the selection of the successor” and the study was measured it through two indicators: “sharing knowledge freely among members”, and “continuing the family role of doing business without any disconnection.”

- Family involvement to the management

Generally, the director of the board of any type of company is consisted the owners of the entity. It is not dissimilar with FOBs, and based on the level of ownership, family members take positions on the board of directors. If the business is totally owned by one company, on most occasions, the entire board is represented solely by family members. If a high percentage of family members are in executive positions, they have the power of decision making. In other words, without interference, they can decide the future direction of the company. This study defines family involvement in management as “family member’s active contribution toward decision making”. Therefore this study was measured this through two indicators: “expert evaluation vs. criticism of successor’s decisions”, and “the supportive role of being members of the board”.

Dependent variables

- Satisfaction

There is no definite agreement among researchers about what contributes to the successfulness or effectiveness of BSP in FOB. Some researchers suggest “satisfaction of the BSP from the incumbent, the successor and other family members, as the indicator of the perceived success” (Cabrera-Suárez et al., 2001; Dyer, 1986).Sharma et al.(2003) employed this performance indicator for their research on “predictors of satisfaction with the succession process in family firms.” Under this study framework however, this study has collected data from FOBs who had their BSP within the period from 2000 to 2013.Therefore, it has failed to collect data from incumbents and their family members. Therefore, this study has come to the decision to measure ISBSP of the successors of various business units. This study defines ISBSP as “perceived satisfaction of succession before post succession FOB performance is accurately known.”

- Business Performance

Apart from that, others have used “successors’ ability to keep the FOB healthy” as the measurement to appraise the business unit. Venter et al.(2005) and Sharma and Irving (2005) express the perceived success of the BSP is determined by the extent of satisfaction with the process and continued profitability. This study used Post Succession Business Performance (PSBS) as the second dependent variable. Business performance has several related terms such as business development, and business improvement. Riding (2005) illustrates that business performance can be divided into four categories: financial performance, customer base performance, employee base performance and environmental base performance. Jarvis et al (1996) have revealed in their organizational theories and accounting literature, that profit maximization is the central goal of firms. In that way, some studies have included both objective measures, which are obtained from organizational records (Seashore and Yuchtman, 1967) and

subjective measures, which are perceptions collected from organizational members and stakeholders (Campbell, 1977).

In order to be objective, this study considered financial performance the same as business performance. Furthermore, Zahra (1991) emphasises that growth measures for performance may be more accurate and available than accounting measures of financial performance. Rosemond (n.d) (cited in Etzioni, 1964) has reported that performance should be viewed in relation to one or more goals in an organization, and has suggested percentages to measure performances for businesses. In this context, this author agrees that business performance is a valid indicator for assessing the effectiveness of BSP (Morris et al., 1997; and Goldberg, 1996).Hence, this has been used to compare pre and PSPs of FOBs.

In various literature, relatively few papers endeavour to address this issue empirically, but most attempts focus on the comparison between family and non-family businesses (Daily and Dollinger, 1992) instead of the different modes of successes. Academics and researchers argue that business performance is a multi-dimensional construct (Fitzgerald and Moon, 1996 as cited in Wang et al., 2004).There are two highly recognise business performance modes for the evaluations named: the European Foundation Quality Management model and the American Malcolm Baldrige National Quality Award model. These provide a comprehensive framework that assesses companies directly and compares them with others. However, these two models are only highly appropriate for large-size companies and not medium and small sized organizations (Wang et al., 2004).
Financial outcomes enable managers and business owners to make decisions and plan business development (Jenkins, 1995 as cited in Wang et al., 2004).Financial outcomes are broadly utilized in the SME and entrepreneurship literature (Morris et al., 1997).However, there is broad agreement that no one single financial indicator can accurately and comprehensively capture business performance, particularly in the scope of small firms (Daily and Dollinger, 1992).Taking this into consideration, it is preferable to devise a multiple measure of financial performance and interpret the results based on one indicator in conjunction with other indicators. This study used business performance as a second dependent variable.

There are a number of performance evaluation tools available for profit-oriented organizations. Most of these techniques directly relate to the financial performance of the organization. “Profitability” and “management efficiency” are the indicators commonly used. Return on Equity (ROE), Return on Sales (ROS), Return on Assets (ROA) and Earnings per Share (EPS) are some common examples of profitability indicators. After considering the study population, this study expected to use Average Returns on Assets (ROA) and Average Returns on Sales (ROS).

Handler (1989) and Morris et al. (1997) also mention that “success has two interactive dimensions: satisfaction with the process and the effectiveness of succession.” Chrisman et al.(2005) express the importance of family relations and the effectiveness of the business entity, and they identified two perspectives to measure the success of the process: business performance and family harmony, and named these as “two pillars for family firm performance.” The author agrees with Cabrera-Suarez et al.(2001) ; Dyer (1986); Handler (1990); Morris et al.(1997); Sharma et al.(2001) and they believe that the success of the BSP is defined as “the subsequent positive performance of the firm, the ultimate viability of the business and the satisfaction of stakeholders with the succession process.” At last, a conceptual argument can be brought toward as an interactive relationship between these two dimensions of success in the BSP of FOB. According to Sharma et al.(2001) “…performance may also alter family member’s satisfaction with the succession process even in the absence of any changes in the relationships among family members.”

In order to be subjective, further, this study considered to use a scale to measure successor’s perception about business performance. For that, this study used scale named “the perceived success of the succession process” developed by Venter el al in 2005.

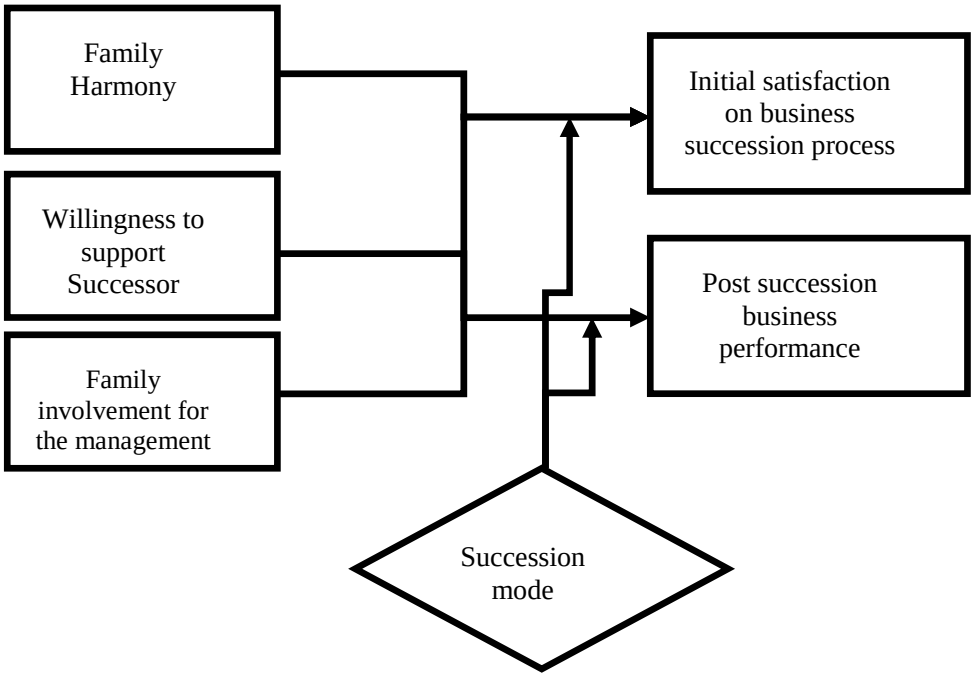

Figure 1: Conceptual framework

Hypothesis of the Study

Hypothesis

Alternative hypothesis (H1.a1): Family harmony significantly correlates with the ISBSP.

$$H_{1.a1}: P_{FHAR2SSP} \neq 0$$

Where:

FHAR2SSP = Family harmony influences to the level of initial satisfaction business succession process

Alternative hypothesis (H1.b2): Family harmony significantly correlates with PSBP.

$$H_{1.a2}: P_{FHAR2BP} \neq 0$$

Where:

FHAR2BP = Family harmony influences to the PSBP.

Alternative hypothesis (H2.b1): Family member's willingness to support successors significantly correlate with the ISBSP.

$$H_{2.b1}: P_{FSUP2SSP} \neq 0$$

Where:

FSUP2SSP = Family members' willingness to support the successor influences to the level ISBSP.

Alternative hypothesis (H2.b2): Family members' willingness to support the successor significantly correlates with PSBP.

$$H_{2.b2}: P_{FSUP2BP} \neq 0$$

Where:

FSUP2BP = Family members' willingness to support the successor influences tithe PSBP

Alternative hypothesis (H3.c1): Family involvement in management significantly correlates with the ISBSP.

$$H_{3.c1}: P_{FMGT2SSP} \neq 0$$

Where:

FMGT2SSP = Family involvement in management influences to the level of ISBSP.

Alternative hypothesis (H3.c2): Family involvement in management significantly correlates with the PSBP.

$$H_{3.c2}: P_{FMGT2BP} \neq 0$$

Where:

FMGT2BP = Family involvement in management influences to the PSBP.

Sample Design

This study screened the population of "FOBs that have done their BSP within the period from 2000 to 2010".Under these circumstances it assumes that memories of the BSP are relatively fresh in the minds of the successors and that their responses will be accurate. Due to a national database for screening being unavailable, SME database was used because according to the literature, the majority of SMEs are FOBs (Commission, 2006).Author preferred to use only the "number of employees" for identifying FOB units for their study. According to Sumanasena (n.d) "The most common categorization based on employees in Sri Lanka is 4 to 49 employees for small-scale enterprises, 50 to 149 for medium scale enterprises and more than 149 employees for the large scale."

Thus, for this study, the population is defined based on the following criterion: The sample unit must fit into the aforementioned definition; the SME has had a succession within the period 2007 to 2013; a FMS or an UMS has been appointed to the top executive senior position (CEO/ Chairman).The database managed by the National Chamber of Commerce in Sri Lanka used to distinguish FOBs from SMEs. For selecting sample units, the following procedure has been applied.

A structured research questionnaire that has developed by combining with universal accepted scales and author developed scales. This questionnaire was basically divided into two sections by considering the following objectives: Section 1designed to collect demographic information about FOBs. This section also helped collect data on pre and post business performance. Owner family related factors were measured by the scales originally developed by the author based on the exploratory study. In addition to the financial data, the study used Venter et al.(2005) "the perceived success of the succession process" scales for collecting business performance information subjectively. The original alpha values for this scale was 0.84.Initial satisfaction with the succession process was measured through the scale developed by Sharma et al.(2003). This instrument was constructed by 12 statements which were equally weighted. Every independent variable was also a construct calculated as an equally weighted average of the relevant indicators. The original alpha values for this scale was 0.93.

This study utilized postal and electronic mail surveys simultaneously as the data collation method. The questionnaire was sent with a covering letter and return-paid envelope to ensure it was convenient for the respondents to submit their information. The first reminder was sent three weeks after the initial mailing and the second reminder was sent after six weeks. In addition, selected FOBs were personally visited to some selected FOBs in order to get a deeper understanding about their BSPs.

The Bivariate Pearson correlation was used as the statistical tool for measuring hypotheses 1 to 3.Tests of significance for the first above-mentioned hypotheses developed to understand the nature and relationship either positive (+0.1) or negative (-0.1) between independent variables and dependent variables, those were designed on an interval scale and measured by denoting "two tailed." The generally accepted conventional level of significance, denoted by 'sig' or 'p' value is 0.5 in social science researches (Shekaran, 2009).In this study also the degree of correlation was accepted if the variables had a significance of $p \leq 0.5$, which reflected 95 or more times out of 100 make sense of relationship existing among the variables were fallen true.

Reliability and validity

For the pilot survey, 10 successors were selected from the population, and the survey instrument was a structured questionnaire. Each successor took about 20 to 25 minutes to complete the questionnaire after the study objectives were explained. The author directly assisted the respondents to fill in the questionnaire by clarifying instructions and explanations. As a result of the pilot survey, a number of changes were made to improve the clarity of the questionnaire and to improve the construct validity of the questionnaire. This helped to increase the efficiency of the questionnaire and survey data.

Moreover, to test the internal consistency and reliability of the study, it used Cronbach's alpha. The study employed the scales developed by Sharma et al.(2003) and Venter et al.(2005) for the present study. Sharma (2003) and Venter et al (2005) have confirmed that the scales were reliable (Cronbach's alpha values were within the acceptable range).However, these scales were translated to Sinhala and Tamil languages. Therefore, again a reliability analysis was done and all independent and dependent variables were within the acceptable range.

Table 1: Reliability analysis

Construct	Variable	Cronbach's alpha
Family related factors	Family Harmony	.729
	Willingness to support the successor	.766
	Family involvement in the management	.754
Business performances		.821
Initial satisfaction with business succession process		.721

Data Analysis and discussion

Table 2: Family harmony

Hypothesis No.	Relationship	Correlation	M	SD	N	Sig.
H 1.a1	With initial satisfaction (All successors)	.444**	2.99	0.60	128	.000
H 1.a2	With PSP (All successors)	.384**	2.99	0.60	128	.000
H 1.a1	With initial satisfaction (Family successors)	.615**	3.01	.59	86	.000
H 1.a2	With PSP(Family successors)	.443**	3.01	.59	86	.000
H 1.a1	With initial satisfaction (Unrelated successor)	.096	2.95	.62	42	.546
H 1.a2	With PSP (Unrelated successor)	.254	2.95	.62	42	.104

** Denote significance at 1 percent level (2-tailed)

Source: Survey data

Family harmony directly influences the family member successor because if the family refuses to accept their appointment, or do not believe in their competence, or do not trust them, then the successor is unable perform well.

In the Sri Lankan context, family harmony and willingness to support the successor have not become strong issues because they are highly emphasis collectivism. Individuals are not working for their own self-esteem. They highly concern about people around him. Under this background, that family harmony and willingness to support a successor do not have identified as a big issue. In cases of UMSs, most families have taken the decision to appoint them due to a

serious lack of alternatives within the family, and therefore they must learn to trust an outsider and give their commitment to their role in order to encourage maximum results.

Willingness to support the new successor

Table 3: Willingness to support successor

Hypothesis No.	Relationship	Correlation	M	SD	N	Sig.
H2.b1	With initial satisfaction (All successors)	.371**	2.87	0.54	128	.000
H2.b2	With PSP (All successors)	.129	2.87	0.54	128	.146
H2.b1	With initial satisfaction (Family successors)	.446**	2.84	.52	86	.000
H2.b2	With PSP(Family successors)	.241**	2.84	.52	86	.025
H2.b1	With initial satisfaction (Unrelated successor)	.135	2.94	.55	42	.395
H2.b2	With PSP (Unrelated successor)	.064	2.94	.55	42	.689

** Denote significance at 1 percent level (2-tailed)
Source: Survey data

Willingness to support the new successor is statistically significant with the ISBSP, but there is no statistically significant relationship with the PSP for all successors. If family members are not content with the new appointment, they have the opportunity to work against successor and his appointment. In Sri Lankan culture though, in most families, the eldest son has more appreciation than any other family members and it is second only to respect for the father. Most of the time, the eldest son is directly involved in decision-making at home when the father is absent. Sometimes the father discusses issues with the son before making a decision. He has sacrificed lots of resources such as time and money in order other family members develop. In most cases, the eldest son does not get married until his younger sisters get married. In such a situation, he has automatically become the most powerful member in the family. If the circumstances are like this, then willingness to support the successor is not identified as highly important because family members are generally committed to the business and are happy to follow instructions given by the eldest son.

Family involvement in management

Table 4: Family involvement for the management

Hypothesis No.	Relationship	Correlation	M	SD	N	Sig.
H3.c1	With initial satisfaction (All successors)	.405**	3.12	0.67	128	.000
H3.c2	With PSP (All successors)	.238**	3.12	0.67	128	.007
H3.c1	With initial satisfaction (Family successors)	.460**	3.04	.62	86	.000
H3.c2	With PSP(Family successors)	.345**	3.04	.62	86	.001
H3.c1	With initial satisfaction (Unrelated successor)	.209	3.29	.75	42	.184
H3.c2	With PSP (Unrelated successor)	.263	3.29	.75	42	.093

** Denote significance at 1 percent level (2-tailed)
Source: Survey data

Family involvement in management positively correlates with the successor's ISBSP and post succession performance under the sample categories of all (combine) and FMS. It is statistically significant with both the Initial satisfaction with business succession process and post succession performance concerning the combine and FMS. The presence of the family in the governance structure of the firm may be another source of strength. Consequently, the high percentage of family members sitting on the board of directors and in executive positions give more decision power to the family because altruism is expected from members toward one another due to kinship obligations.

Table 5: Acceptance and rejection of null hypothesis (influential factors and initial satisfaction about business succession process)

Hypothesis No.	All successors	Family Member Successors	Unrelated managers Successors
H1.a1	Rejected	Rejected	Accepted
H1.a2	Rejected	Rejected	Accepted
H2.b1	Rejected	Rejected	Accepted
H2.b2	Accepted	Accepted	Accepted
H3.c1	Rejected	Rejected	Accepted
H3.c1	Rejected	Rejected	Accepted

Source: Survey data

Conclusions

If family members decrease their commitment to the FOB and their involvement in its activities and/or resign from holding company positions during the business succession process, it shows their unwillingness and dissatisfaction with the new appointment. It could also be a sign of their lack of trust about the business future with the new successor. On the contrary, if family members continue in their positions and are committed to supporting the successor, it shows a willingness and trust with the new appointment. If family members give their undivided support to the new successor, willing to share knowledge without hesitation, to help them during difficult situations, and to stand with the successor to protect the company, then it increases the successor's satisfaction and also increases PSP. Family harmony is the relatively important factors to increase level of satisfaction.

Recommendations for future research

This study presents a generic model to evaluate the relationship between family related influential factors and PSP. However, future research may well focus on confirming these results by analysing a larger sample. Furthermore, research is better conducted in diverse countries which have a dissimilar cultural background. This may be done by dividing the total sample into segments: first generation to second succession, and also second generation to third succession etc...

This model considered only 03 independent variables: three factors related to the family. Researchers though may identify other influential factors relating to each stakeholder by scrutinizing various literatures. They can then include these factors into the research framework and testing process. This model is only based on family concerning the BSP. Additionally, Successor related, incumbent related factors, the succession plan, taxation regulations and mode of legislations can all influence the BSP. It is therefore better to develop a conceptual framework with that all and test the factors influencing the BSP.

Abstract

To cope with daily stresses of modern society, adopting the concept of therapeutic landscape in a public library has become essential for the purpose of satisfying library users' perception and expectation. It began with an attempt to understand the needs of users towards the library therapeutic landscape quality provided by the public library. In addition, this study looked at the relationship between all the twelve (12) dimensions of library therapeutic landscape quality which was adopted based on a modified therapeutic landscape model and service quality framework (SERVQUAL). As the expectation and perception of the users with the overall satisfaction. The purpose of this paper is to discuss the concept of therapeutic landscape and satisfaction. The paper will also propose a research conceptual framework of a potential research which the main main objectives are to assess the public library therapeutic landscape quality and satisfaction. A quantitative research was used to study the gap and the relationship between library therapeutic landscape quality and satisfaction. An evaluation study using questionnaire survey will employ to measure the users' perception towards twelve (12) library therapeutic landscape quality dimensions and their overall satisfaction.

Keywords: Public library, therapeutic landscape, quality, users' expectation, users' perception, satisfaction,

1. Introduction

As a community centre, public libraries serve as centres that support community information needs and society's development. Society uses them as a medium for information sharing and knowledge benefit. Public libraries have helped to transform and improve the quality of people's lives. Research evidence shows how and why natural and landscape characteristics, ease people pressure and change people's moods from various perspectives. Hence, previous research on the public library therapeutic landscape best practices has also been conducted. This is because to cope with daily stresses of modern society, adopting the concept of therapeutic landscape in a public library has become essential for the purpose of satisfying library users' perception and expectation. This study began with an attempt to understand the characteristics of users towards the library therapeutic landscape quality provided by the public library. Consequently, the study will explore the relationship between all the twelve (12) dimensions of library therapeutic landscape quality which was adopted based on a modified therapeutic landscape model and the service quality framework (SERVQUAL) and the expectation and perception of the users with the overall satisfaction. The study will also propose a research conceptual framework of which the main objective is to assess the public library therapeutic landscape quality and satisfaction. A quantitative research approach will be adopted to study the gap and relationship between library therapeutic landscape quality and satisfaction. Questionnaire survey

will be employed to measure the users' perception towards twelve (12) library therapeutic landscape quality dimensions and their overall satisfaction.

1.1. Background

In Malaysia, public libraries serve as part of the community centres which exist to support community and society's development. Students, teachers, educators, parents, people and many more use them as the environment for information sharing and knowledge benefit. It is a basic thing to use the library as an emporium to shop for knowledge, in general to a specific area. Libraries play a major role in a child's development, if used correctly by society. As states by the Institute of Museum and Library Services (IMLS, 2013), Libraries and museums can play a stronger role in early learning for all children. Therefore, a library for children in a public library setting is a must for early child development. No-one should doubt the importance of children's libraries to children and their families all over the world. They are often the first encounter with lifelong learning, introducing the readers and learners of the future to an exciting, rich and varied resource (IFLA, 2003).

Public libraries that are also under categories of state libraries and its branches and its rural libraries or community libraries have an administrative power under state government or local authority and the role of National Library Malaysia is to channel and monitor development and operational budget on behalf of the Federal government. Specifically there is 12, 358 libraries in Malaysia, only (1) National Library of Malaysia, 1401 state Public Libraries, which is state (14), region (1), branch/district (173), town (15), rural (1089) and mobile (82) and the rest fall under academic libraries (366), special libraries – ministries/department/government agencies (493), (174) special libraries (private agencies) and school resource centres (9922) – primary school (7,643), secondary school (2,163) the sources of information is from National Library Malaysia Report at 2012 (NLM, 2012).

1.2. Therapeutic Landscape

The idea of therapeutic landscape has been widely used to describe the relationship between place and improvements in mental health (Brewster, 2014). Therapeutic landscapes itself is taking a role as a platform of recovery process whereby its concept which includes safe spaces, favourite places and enabling places; have been outlined to suggest that the attributes support recovery and encourage well being (Duff, 2012; Yates et. Al., 2012). Wilbert Gesler (1992) developed the concept of therapeutic landscapes in a health geographical thinking. Its theoretical origins in cultural ecology, structuralism and humanism. The framework analysis of natural and built, social and spiritual environment as they contribute to healing and well being in places – broadly termed landscapes (Gesler, 2003). Mainly applied to places that had achieved a reputation for healing (Gesler, 2003) or extended to places that promotes and maintains well being and health (Williams, 1999, 2000). In fact, other research evidences have explained how and why natural views and landscape sceneries ease people's pressure and change their mood from various perspectives, including: medical geography (Gesler, 2003), environmental psychology (Kaplan and Kaplan, 1989; Kaplan, 1992; Ulrich, 1984, 1999), ecological psychology (Vries, 2010); Moore and Cosco, 2010), and horticultural therapy (Detweiler, et.al., 2012; Soderback et al., 2004).

Therapeutic landscapes or spaces of care may be perceived differently by different target audience, what is therapeutic must be seen in the context of social and service conditions and changes. The research emphasis the need to identify the variables and dimensions of the public library therapeutic landscape with special significance as 'healing places'.

1.3. Statement of Problems

Current social problems among youth in Malaysia are challenging their parents, society as a whole and the government. The state of social wellbeing is deteriorating with an increasing number of youth involving in drug addiction, sexual abuse as well as suffering from mental illness. Penalties, such as fines, prison and execution have been used to combat these problems, yet without a great deal of

success. At present, the Malaysian government has shifted its attention to different approaches which take into account social welfare and human services. There is an increased commitment shown by the Malaysian government to providing more training for counsellors and for building rehabilitation centres. Several studies have started to explore the impact of public library on wellbeing by trying to identify the qualities that make the public library an essential element of community life (Curry and Alstad, 2003; Toyned and Usherwood, 2001). However, studies have struggled to define the role of public libraries in the recovery process, and concepts including safe spaces. The rewards of engaging with the public library are seen as intrinsic which involved intangible qualities which is highlighted at the end of the paper. As for the statement of problems concerning the research gaps, the author has categorized it into three:

a. **Practical Gap**: Lack of practical instruments which can be used by library to evaluate the therapeutic landscape quality and satisfaction.

b. **Empirical Gap**: Limited number of literature on Library Therapeutic landscape as factor of Library Therapeutic Satisfaction in the context of Public Libraries in Malaysia

c. **Theoretical & Methodological Gap:** Library Therapeutic Satisfaction: Previous studies focused little attention on the contribution towards library therapeutic satisfaction of public libraries. Library Therapeutic Landscape Quality: Previous studies using qualitative method in studying on public library as therapeutic landscape

2. The Proposed Conceptual Framework

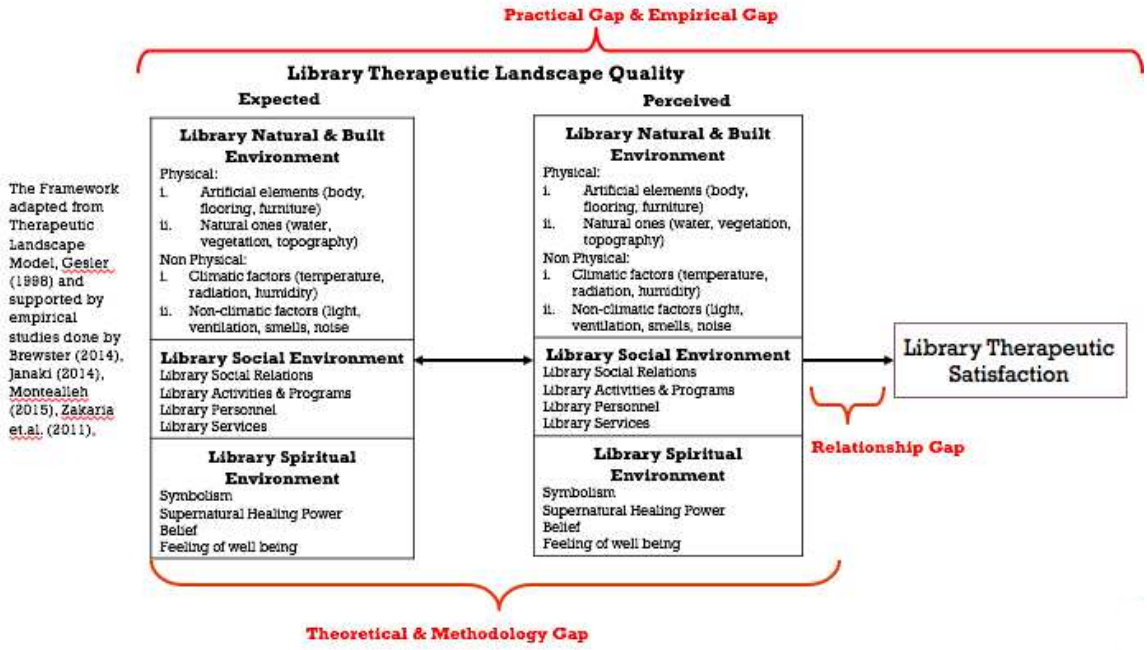

Fig. 1. Proposed Conceptual Framework

This article attempts to highlight a research conceptual framework of a study that will assess the public library therapeutic landscape quality and satisfaction and how it can be used as a platform to encourage children well being. Figure 1. depicts the proposed model for measuring the public library therapeutic landscape quality

The research conceptual framework is constructed based on previous studies of Wilbert Gesler (1998) on therapeutic landscape and also adopting the theory of SERVQUAL. Currently there are many quantitative instruments that are used by libraries such as SERVQUAL and LibQUAL. SERVQUAL which was developed by Parasuraman, Zeithaml, and Berry (1988) and at present it is extensively used by numerous academic libraries in the USA (Nitecki and Hernon, 2000). While, LibQUAL survey evolved from a conceptual model based on the SERVQUAL instrument and offered to the library community by the Association of Research Libraries (Association of Research Libraries Statistics and Assessment Program, 2014).

The framework is conceptualized based on previous studies. For independent variables it is adopted from the model of therapeutic landscapes by Gesler (1998) that consists of 3 dimensions which are natural and built environment, social environment and spiritual environment and supported by empirical studies done by William, 1998; Palka, 1999; Thurber & Malinowski, 1999; Kearns & Barnet, 1999; Scarpaci, 1999; Kearns & Collins, 2000; Williams, 2002, Wilson, 2003; Miligian et.al., 2004; Martin et.al., 2005; Korpela and Ylean, 2007; Ravi, 2008; Brewster, 2014; Montealleh, 2015.

2.1. Library Therapeutic Landscape

Based on previous literature, the characteristics for *Library Therapeutic Landscape* include features such as familiar and welcoming environment, quiet, calm atmosphere, empowerment associated with being able to make non-commercial, unpressured decisions about what to read in which will contribute to the opportunity to conduct an act of self-care by withdrawing from stressful situations while being in the library as a space (Brewster, 2014). Therefore the purpose of the library therapeutic landscape quality measurement is to develop a method of evaluation of therapeutic landscape quality; by measuring the expectation and perception of the library users in relation to the therapeutic landscape satisfaction.

Public Library must improve the quality not only in service but also on the library therapeutic landscapes quality in order to survive and to success by having a quality service performance focus of as it is an institution that may promote condusive environment as to support well being, a space of restoration as well as promoting holistic healing (Martin et.al., 2005; Wood et.al., 2013; Brewster, 2014; Hhusaini, SA Noordin, SM Shuhidan, 2015). The framework also adapting the original concept of therapeutic landscape by Wilbert Gesler (1992, 1998) and the quality model of SERVQUAL and LibQUAL as mentioned above. This study come out with three basic variables; Library natural and built environment, Library social environment and Library spiritual environment. Those variables are developed based on the previous studies, preliminary study and systematic review of the literature.

2.1.1 Library Natural and built environment

Landscape literally means a picture of nature; or is part of nature. Allowing the elements of nature into people's lives may promote the quality of life. Landscape making relationship between nature and both human and human communities. According to Montealleh et. al., (2015), the elements of landscape such as the physical elements, non-physical elements, human elements. For this study, the researcher focusing the two main dimensions of library natural and built environment which are physical and non physical elements. Based on studies by Montealleh, et. al., (2015); Brewster (2014) and Wood et.al. (2013) physical elements comprise the context of space which also include the artificial elements such as building, flooring, furniture and natural elements like water, vegetation and topography. As for non physical elements, the climatic and non climatic factors are included. As for the climatic factors; the features include temperature, radiation, wind and humidity. On the other hand, the non climatic factors are; light, smell/scent, noise and weather in which surrounded the library atmosphere.

2.1.1.2 Library Social Environment

For library social environment, it is consists of four dimensions which are library social relations, library activities and programs, library personnel and library services. According to Aarts & Dijksterhuis (2013), it is a process oriented approach to investigate how situational norms guide

social behaviour. It was posited that situational norms can be seen as associations between environment and normative behaviour in memory that are shaped by social influence.

2.1.1.3 Library Spiritual Environment

The holistic approach has evolved and practices in the library facilities, services and activities. Its to develop a positive mind and soul of the user and ambience. For many people that involves some degree of belief in a higher power that is labelled in many ways (Patel, 2003). Intangible construct that allows people to make sense out of the unexplainable and unanswerable parts of their lives and their worlds.

3. Methodology

All self-developed questionnaire will be used to gauge the respondents' library therapeutic satisfaction on the library therapeutic landscape in the library. The objectives of this study are as below:

i. To identify the dimensions of the public library therapeutic landscape
ii. To determine expected library therapeutic landscape quality provided by public libraries
iii. To examine perceived library therapeutic landscape quality provided by public libraries

This study will explore the public library therapeutic landscape quality based on users experience in using library service & facilities. The research will also propose research conceptual frameworks which assess the public library therapeutic landscape quality and satisfaction. The research will evaluate user's experience using three constructs which includes the elements of natural & built environment, social environment and spiritual environment of the library. Quantitative research approach will be engaged to study the gap for library therapeutic landscape quality and satisfaction. The results of the quantitative assessment of perceived library therapeutic landscape quality may provide some insights on how users rate the library therapeutic landscape quality of public libraries. Thus, the findings can be used as a guide for library management to improve the crucial quality attributes and enhance library therapeutic landscape quality of the library.

4. Summary

The research conceptual framework presented in this paper offers an opportunity for further investigation on the public library adoption of the therapeutic landscape and SERVQUAL and Lib QUAL concept and how the services and facilities influence the users' satisfaction. Hence, in order to validate the framework and the corresponding prepositions, the researcher will adopt a quantitative research approach involving the Malaysian public libraries. The scope of the study covers the public libraries from both the East and West Malaysia. This study will produce a Model of Library Therapeutic Landscape Quality of Malaysian Public Libraries in the context of the public library. Instrument to assess the library therapeutic landscape for public library will also developed. It is hoped that the findings may highlight the insights of the library therapeutic landscape quality conducted by the libraries and how they promote to the quality and healthy life.

Acknowledgements

We would like to extend our deepest gratitude to the Ministry of Education of Malaysia, and Universiti teknologi MARA (UiTM), for giving ways and opportunities for us to further conduct this research project.

Abstract

The focus of this research is in the area of Financing / Loans acquired by Pakistan over the decades. This study is very important for forecasting the future of Pakistan's financial strength. The data was collected from the State Bank of Pakistan, period from 1949 to 2010. The findings from this research provide the evidence that the external debts are growing in a very fast rate, which will create a great hurdle in coming future for Pakistan. The main conclusions drawn from this research is that the external debts are growing at an average rate of 14.40% per year and also demonstrated that if external debts increase by PKR 1 million in a year, in the next year it will increase by PKR 1.155 million. This research recommends that the outstanding debt can be taken care a special attention when fiscal and monetary policies are made in which external debt repayment should be given high importance along with the strict control over corruption. Government must introduce easy trade policies, which may boost up the exports in order to generate balance of trade, which may help in repaying the external debts.

Introduction

Background of the research

Like other nations Pakistan has also borrowed huge amount of money from sources outside of Pakistan, making it a large acquirer of external debt. The purpose of debt is commonly to speed up the economic growth, in particular when domestic sources are insufficient. Most economic theories claim that external debt does help in economic advancement through factor gathering and production growth. This is because at the initial stage when the countries are developing and have limited capital and the investment chances are very limited. If the debtor country utilizes the loan funds in creative investments along with macroeconomic constancy, will not only be able to enhance the economic growth, but also pay off the borrowed debt without any hassle.

As external debts have a positive side like economic growth, it also has a harmful side, as it does not remain a useful because it accumulates beyond a limit point. If the external debt crosses that point, it will reduce progress by hindering investment and productivity development. When larger percentages of reserves (foreign currency) are spent in meeting debt obligations, solvency decreases affecting access to external financial resources. It is also observed that increment in external debt burden is continually enhanced by a related increase in debt-service requirement, which has negative effects for economic development and thereby for country's capacity to settle debt and debt-service obligations.

If fiscal policy is not supportive then debt strategy will not succeed. The importance of sensible fiscal policy could not be overemphasized because the core source of increase in debt creates fiscal disparities. A comprehensive fiscal policy is vital for avoiding macroeconomic differences and realizing the full development potential. In 1990's Pakistan observed serious macroeconomic inequalities especially in terms of its fiscal profile. Perseverance of large fiscal deficit outcomes in

unmanageable levels of public debt affected the country's macroeconomic situation. Therefore, Pakistan paid a heavy price for its fiscal intractability in terms of slow economic development and investment, which also increases in the levels of poverty. Extensive efforts have been made over the last decade to instruct financial discipline by pursuing a sound fiscal policy. Pakistan's hard earned macroeconomic stability is supported by fiscal discipline.

Pakistan's external debt reached an extraordinary point during the 1990s followed by an exuberant growth in next decade. A study conducted by Ahmad (2013) finds that there is a rapid increase in external debts right after 2005 and the debt amount becomes doubled by the end of 2012 just in 7 years compared with the era 1972 - 2005 consists of 34 years. The study further reveals that average external debt in democratic regime is significantly higher than the military regime.

The causes of rapid increase in external debt include inadequate use of borrowed funds in the form of careless government expenditure, and financing of present spending, and investing in low priority development projects, and poor implementation of foreign aided projects. Because of an impulsive use of foreign loans debt carrying capacity of the country deteriorated due to its deteriorating real revenues and exports, eventually increasing real cost of government borrowing, both local and external (Ahmed et al., 2014).

In order to shield its forthcoming credit-worthiness, Pakistan like many other nations of the world has introduced certain preventive measures to limit inflationary pressures and to protect the competitiveness of its exports. Though, there is a substantial time-lag for these measures to work their way through the economy, its growth gets affected negatively from disruptions in their efficacies.

Through this study we will compare the fluctuation of external debt burden in different eras.

Brief History

Since its independence Pakistan severely relied on external support. A number of factors and variables are considered for this great reliance of Pakistan on foreign resources. Domestic savings and investment rates were low due to very low levels of per capita income, the persistent need to assist the millions of people displaced by partition, and the need for creating the basic administrative apparatus and institutions, which were needed to run a new country. Pakistan observed persistently large fiscal and current account deficits for a very long duration. Fiscal deficit averaged 7 per cent of GDP during last two decades (1980s and 1990s), while current account deficit averaged 5 percent of GDP in the 1990s. Mostly creating external inflows financed these deficits. The peak of Pakistan's economy remains the decade of the 1960s when the GDP growth rate averaged 6.8 percent annually. The investment rates reached a peak of 23 percent in 1964-65 and foreign saving financed almost half of this investment. The 1965 war with India led to a setback, and the level of aid declined. The higher incomes generated during this period, which boosted the domestic savings rate that reached almost 12 percent. The separation of East Pakistan, the two oil shocks, and a fundamental change in the economic philosophy of Pakistan increased pressures on the external finances of the country in the 1970s.

The Afghan war brought a surprising windfall in the form of increased assistance from the United States. This allowed the government to avoid the need to rearrange the economy and remove the imbalances on fiscal and external account. The growth of the foreign debt increased after 1980s, which created the serious problem of debt servicing in the country and Pakistan cruelly faced budget balance problems. All these years Pakistan's tax to GDP ratio did not improved, making dependence on foreign aid a permanent feature of Pakistan's economy. Pakistan's debt situation continued to get worse in the 1990s. By the mid-1990s debt servicing was consuming more than half of the country's annual revenues, leaving limited space for development and social expenses (Ahmad, 2015).

The problem of high current account deficits and high fiscal deficits became more difficult in the 1990s as compared to previous decades. This led Pakistan into greater reliance on foreign funds to

finance the difference. The 1990s have been considered to be a series of important shifts in the nature of capital flows to the Pakistani economy; the effects of these changes for the country's debt profile are equally important. With the passage of time the debt burden on Pakistan continued to grow. It is evident that after 1990s growth performance of Pakistan deteriorated while the accumulation of foreign debt and aid augmented (Ahmed *et al.*, 2014).

Purpose of Research

The aim of the study is to compare the external debt received from different foreign Institutions and countries on annual basis. The change in amount of external debt during different democratic and military regimes was also analyzed.

Research Question

Does the average External Debts of Pakistan varies in military and Democratic regimes?

Previous Research

Sachs (2002) highlighted that there is a theory developed known as "dual gap" theory. The study focuses on bringing capital and savings to a sufficient level that one can achieve self-sustaining growth. It states that the primary reason for opting for external debt rather than utilizing domestic resources only makes the basis of "dual gap" theory. The theory states that for sufficient investments for economic development we need savings, and in developing countries tendency to save is quiet less hence it is not sufficient enough to invest in the development.

One can borrow external funds as long as the rate of return from its investment is equal to or greater than the overall cost of borrowing (Ajayi & Khan, 2000). In crux, with the aid of this simple principle, the country is using external funds in a positive way and generating revenue from it and not making external borrowing a burden.

Ubok-Udom (1978), says that external debts include the debt service burden and also incorporates all the cost implied by the term for which external debt has been borrowed, cost of the liquidity crisis that might erupt, cost of managing the debt, cost of rescheduling of debts and many other related costs.

Colaco (1985) explains the hurdles and problems in debt service for developing countries in two different situations. Firstly that the size of debt has increased to such a point that they are greater than the equity finance, hence resulting in imbalance of debt and equity. Second that the debt with floating interest rates increases so much that the borrower is hit big when the interest rates rise.

Mehran (1986) states that proper management of debt is quiet important in a complex financial setup. According to him critical components of debt management are, proper policing, making regulations, proper accounting and an in-depth statistical analysis. The nation borrowing needs to make fiscal adjustments and make reforms in its financial structure. Further he states that a transparent system, policies towards erasing corruption, refining of debt management structure and proper decision making are the tools that can convert an external debt from a burden to a blessing.

Ajayi and Khan (2000), state that manageable external borrowing can be measured via several different ratios. Some of them are "debt to export ratio", "debt service to export ratio", "debt to GDP ratio" etc. However, proper levels for these ratios cannot be determined and may have many variances due to many factors. For example if the cost of external borrowing gets higher than the return or value generated from it then the burden will pile up and to reverse these kind of situations and countries need to increase their exports, but if they fail to increase exports then the burden could pile up even above the country's capacity to pay it off.

Claessens and Diwan (1989a, 1989b) argue that the burden of external funds inflow can depress

investment below its optimal level and also slow economic growth. This can occur in two ways, (a) inability to get required foreign borrowing, a liquidity constraint, and debt projection which is strong enough, (b) probable future loss of output to foreign creditors. From the debtor country's perspective, the financing costs of unpaid debt reductions and alterations are likely to exceed the benefits. Thus, that Pareto-improving schemes are difficult to find in practice-unless the debtor uses funds donated for this purpose, or that it gains in exchange some allowance from creditors' group. Therefore, predictable debt rearrangement cannot efficiently restructure under a situation of debt extension.

Karagöl (2002) observed relationship between economic progress and external debt provision for turkey between 1956-1996. He used multivariate co-integration techniques. The research showed that there exists an adverse correlation between external debt and economic growth in the long-term basis. "Granger causality" test results pictured a unidirectional causality running from debt service to economic growth.

Mohamed (2005) examined the effect of foreign debt on economic development of Sudan for 1978-2001. The study tells that inflation and external debt unfavorably affected the nation's economic growth. It also showed that revenue generated from exports have considerably favorable influence on economic development.

Mahmood (1997) found that country might be trapped in a severe debt problem due to negligence of macroeconomic factors, inadequate utilization of aid and improper policies. Another insufficiency of current debt management practice is that it rarely highlighted in policy-making authority in Pakistan is the lack of coordination among domestic and external debt.

The country has to accept the challenge to find the way or mean to overcome the accumulation of external debt problem and minimize the associated risk with it, debt management authorities tend to ignore or give low priority to domestic debt management as compared to routine work. Beside Ahmad (1996, 1997, 1999, 2000), and Ahmad and Ahmed (1998), have a tendency to analyze foreign debt as an issue unconnected to domestic debt. Testing exercises in Ahmad (1999) and Ahmad (2000) prove how closely the external and domestic debts are linked with each other. For example, amazing result of this study is that efforts to decrease external debt through privatization, sales of government owned industries to international investors are likely to result in decreeing domestic debt, with unnoticeable impact on External debts.

According to Hansen and Tarp (2000) efficiency of foreign aid remained a debated issue in development of economies. After the end of the World War-II mostly during 1960s and 1970s, foreign aid in huge amount was transferred to developing countries in the form of project aid to improve their growth performance. As it is well recognized in literature, that foreign aid improves output growth if it is utilized in investment and other productive projects.

As per Burnside and Dollar (1997, 2000) and Roodman (2007), however, during 1980s and especially in 1990s it was recognized that the development strategies of the previous decades in developing countries that were started due to transfer of foreign aid to these countries were no longer maintainable. One reason for the failure of foreign aid in support of the economies of the recipient countries is the formation of weak policies in these countries. Both in theoretical and empirical literature it is well recognized that aid works only in countries with good macroeconomic policies situation.

As per Sachs (1989) findings debt-servicing problem might result either from liquidity problems or due to solvency reasons. A liquidity problem would be faced if the borrower fails in gaining the foreign exchange to make the debt service on scheduled time. On the other hand the solvency problem, will arise if the real interest rate on marginal external loan exceeds the addition to national income made by loan.

Chenery & Strout (1996) stated that the main reason for borrowing external finance in developing countries is to fill the "saving investment gap". External borrowing not only hampers investments but

also economic stability and growth. The study states that besides helping in filling the "saving investment gap" external debt badly impacts the growth of developing countries mainly due to the terms and conditions of the lenders.

Perasso (1992) stated that a relationship was examined between the economic growth and external debt by taking data from twenty countries with middle level income and those who were in huge debt. The findings of this study were that with the help of appropriate policies it was easier to increase investment and growth within those economies that were in huge debt as the impact of policies was quiet strong.

Cohen (1993) studied developing economies and examined the link of external debt and investment. This study showed that there is a minimal impact of levels of stock of debt on the investment. The study further revealed that actual service of debt "crowded out" investment.

Ahmad (2000) has used three-gap dynamic model of macroeconomic model of macroeconomic equilibrium to analyze the external debt problem of Pakistan. The author found that if the pattern of external debt continues then Pakistan's foreign debt position would further deteriorate in the future.

Chaudhary (1994) examined that according to the current borrowing scenario, will Pakistan have a greater liability of external debt? He further studied the impact of trade policy and savings policy on foreign borrowings and found that to reduce the debt burden of Pakistan, it has to focus more on trade policy rather than saving policy, as it is more feasible.

Metwally and Tamaschke (1994) studied the economies of countries like Algeria, Morocco and Egypt and examined the link between debt servicing, capital inflows and the economic growth of those countries. They used "Two Stage Least Square (2SLS)" and "Ordinary Least Square (OLS)" methods.

Iyoha (1999) explored the interconnection between external debt and economic development for Sub-Saharan countries for period 1970-1994. The research results showed that external debts have unfavorable impact on investment. The study also pictured that decrease in debt stock would lead to development in investment and economic progress. He also suggested that debt of those developing countries should be absolved to motivate economic development.

Data and Methodology

Following methods have been used to gather data and interpret the result:

Data and Variables

The data used in the research is secondary and has been collected from State Bank of Pakistan for the period from 1949 to 2010. No other source data was used due to reliability issue. SPSS (Statistical Package for Social Sciences) has been used for analysis of data. There are total 3 variables i.e. dependent variable is External Debt, whereas, the independent variables are Regime & Time.

Sample Size

The sample size taken for this research is 61 annual observations from 1949 to 2010.

Estimation Techniques

T-Test, Correlation and Regression models were applied on data by using SPSS to find out the rate of growth in amount of external debts throughout different regimes.

Results and Findings

Two models have been compared in the Figure 1 and Table 1 given output of model summary, which are Linear & Growth models, both are significant as per the Sig. value but here, Growth model is considered because it has higher value of F compared with linear model. Hence the growth model here tends to be more significant as compared to linear model. The growth model also shows the on an average growth of 14.40% per year throughout the sample period of 1949 to 2010.

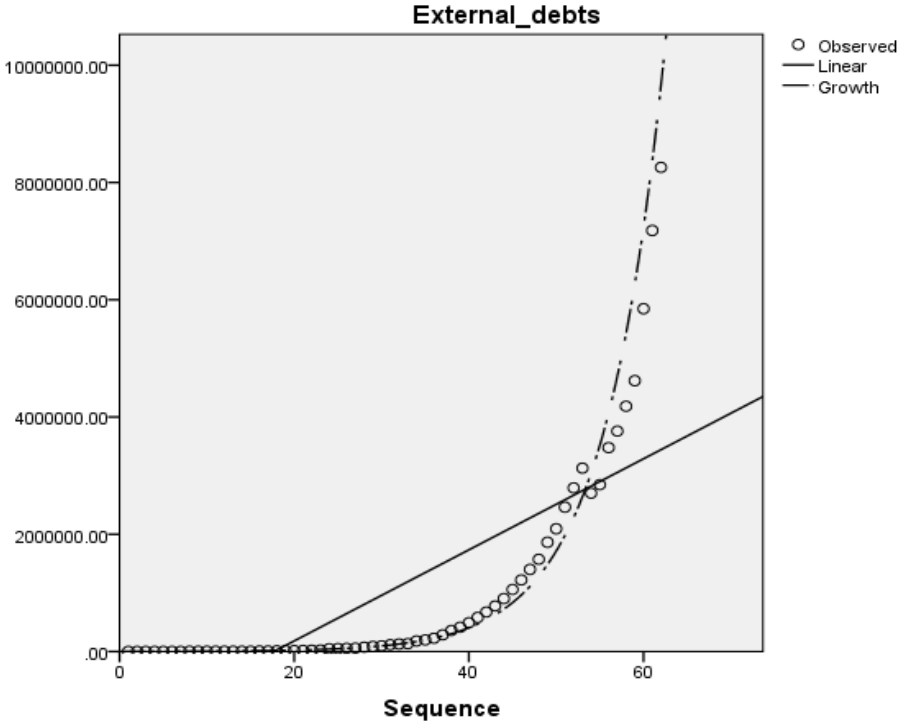

Figure 1: External Debts

Source: Authors' estimation

Table 1: Model Summary & Parameter Estimates

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
Linear	.586	84.841	1	60	.000	-1371876.642	77655.083
Growth	.993	8707.631	1	60	.000	7.150	.144

Dependent Variable: External_debts

Source: Authors' estimation

Auto Correlation

According to Figure 2, in auto correlation total of 11 lags were significant, whereas, in Partial auto correlation only 1st lag is found significant. In auto-regression, it is only the partial auto correlation, which reflects, the regression model is significant at lag 1 only.

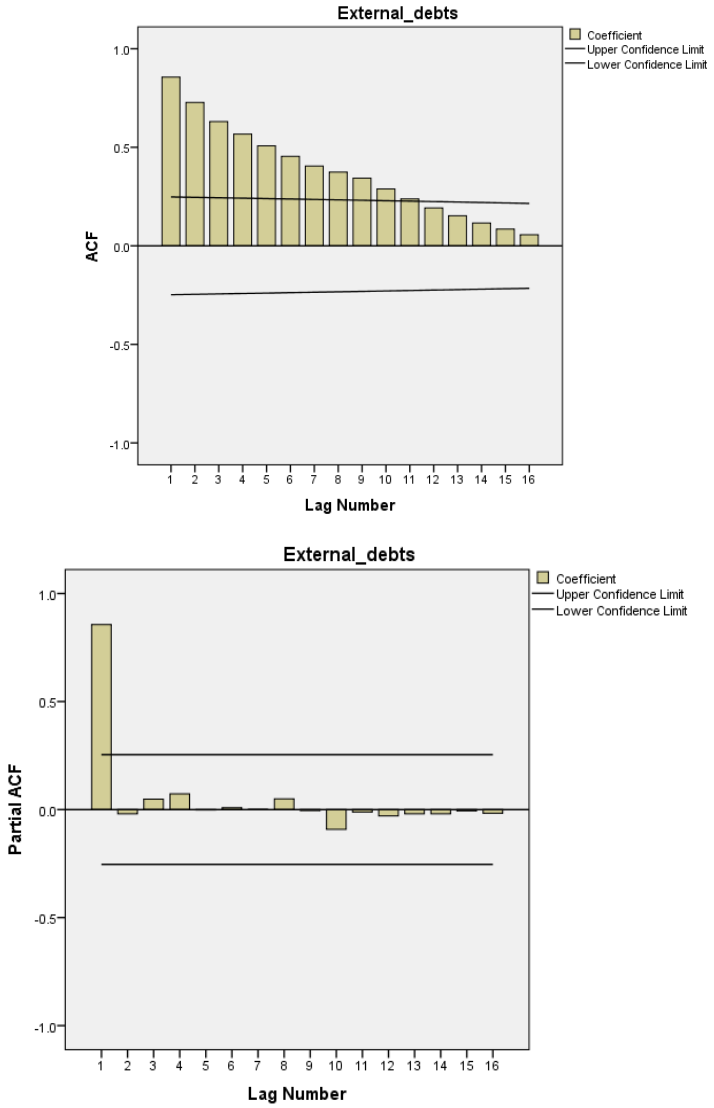

Figure 2: Auto Correlation

Source: Authors' estimation

Correlation Analysis

According to Table 2, the interdependence of External debts with first lag of External debts and Time is positive 99.6% and 76.5% respectively and significant at 1%, whereas, External debt is independent of Regime as the value of correlation coefficient is insignificant.

Table 2: Correlations

		External_debts	External_Debts_1	Time	Regime
External_debts	Pearson Correlation	1	.996**	.765**	-.079
	Sig. (2-tailed)		.000	.000	.540

Model Summary

As we are following backwards regression method in Table 3, we will follow 2nd output. Here, R-square shows explanatory power of the model, which is 99.3% - a significantly high value. Furthermore, there is almost no difference between R-square and adjusted R-square, which endorses that there is no sample error. Durbin-Watson is applicable only for first lag; it has value of 1.597, which predicts that there is positive autocorrelation.

Table 3: Model Summary[c]

Model	R	R-Square	Adjusted R-Square	nate	Durbin-Watson
1	.997[a]	.993	.993	156512.83138	
2	.997[b]	.993	.993	155558.08569	1.597

a. Predictors: (Constant), Regime, External_Debts_1, Time

b. Predictors: (Constant), Regime, External_Debts_1

c. Dependent Variable: External_debts

Analysis of Variance (ANOVA)

Table 4 ANOVA shows overall significance of the model. Here, F value is 4170.534, which is substantially higher than its cut-off i.e. 4. When F-value is very high, it establishes a long-term relation. Moreover, significance of F-statistics signifies coefficient of determination (R-square) as well.

Table 4: ANOVA[a]

Source: Authors' estimation

Coefficients Analysis

As regression was run backwards, system automatically omitted insignificant variables. Over here, time was excluded as insignificant and remaining variables i.e., first lag of External debts and Regime remains significant at 1% and 5% respectively.

According to Table 5, If External debts increase by PKR 1m in a year, in the next year it will increase by PKR 1.155m. Regime was taken as dummy variable value 0 for absence of democracy (military regime) and 1 for presence of democracy. The results show an interesting finding that if there is democratic regime then External debts increases (on average) by PKR 95672.282m compared with military regime. As far as standardized coefficients are concerned, 1st lag of external debts contributes more in the explaining variations in External debts compared with Regime, as the standardized coefficient is 0.999 compared with 0.026.

Table 5: Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	-44174.785	57864.470		-.763	.448

a. Dependent Variable: External_debts
Source: Authors' estimation

Conclusion and Recommendations

Conclusion

The finding of this research shows that the external debts are growing by 14.40% on an average per year. This holds true to the common man's assumption that Pakistan's economy and debt position is worsening day by day. The results also show that If External debts increase by PKR 1 million in a year, in the next year it will increase by PKR 1.155 million. Last five years have been very bad for

Pakistan with regards to increase in external debts, whereas at end of Musharraf era total debts were $35 Billion, whereas, during present governments tenure it has reached surpassed $70 Billion. Be it a democratic government or military regime, only difference regarding the external debts is that during military rule due to strict control on corruption and expenditure the growth rate of external debt somewhat slows down, but still no government has ever been able to fully pay it off or bring it to an easily payable point. Year by year not only the debt is increasing but with the principal amount, the interest to be paid is also piling up.

Recommendations

As we all know that Pakistan's external debts are showing increasing trend and show no sign of decreasing, it will create more hurdles with the passage of time as there will be no source to repay those debts once it surpasses maintainable limits. This outstanding debt can still be taken care of if proper fiscal and monetary policies are made in which external debt repayment is given high importance. Government must make easy trade policies, which may boost the exports to generate balance of trade, which may help in reducing the external debts.

Below given acts are mandatory regarding the government to be implied:

- We need a government, which would make policies that would not only slow down the growth rate of external debts but also work on reducing the debt and paying it off.
- Government needs to control and eradicate corruption.
- Government needs to reduce its expenditures.
- Government needs to properly evaluate the projects it invests in and gage the accounting and non-accounting feasibility of each project.

Abstract

Learning commons is about the relationships and community between the creators (providers) and users of the information. The concept of Learning Commons which currently being acknowledged as significant to support community-driven resources and lifelong learning seems to be lacking within the Malaysian Muslim communities. In the new era, it is important for Muslim community to have an effective Islamic education and its provision has to be made readily and continuously available. Consequently, the new approach of learning has to be infused along the lifelong learning model as to replace the traditional approach. It has been claimed that the current chaotic condition sweeping across the Islamic nations is self-telling about the life condition those countries are in and to alleviate the Muslim from these situations is through education. Hence, the role of a mosque as a learning center for the community has to be re-positioned. The purpose of this article is to propose a conceptual framework for a study on the characteristics of Muslim community Learning Commons for the Malaysian state mosque library with the objectives are to: a) explore the Malaysian Muslim communities' information needs b) determine the physical, virtual and social characteristics of the Malaysian mosques Learning Commons c) propose a framework for the Malaysian State Mosques Learning Commons. The exploration in understanding the information needs of Muslim communities and Learning Commons' characteristics will generate a framework which can be used as a strategic means in the development of Malaysian Muslim Community Learning Commons in supporting lifelong learning.

Keywords: information learning commons (LC), Malaysian mosques, LC characteristics, community information needs

1.0 Introduction

The internet and digital revolutions have allowed more knowledge and information being created, disseminated and transferred. In fact, with the digitization of content and the ubiquitous nature of internet, knowledge and information are created or generated beyond the printed materials and accessible in a single physical platform (Holland, 2015). Therefore, it making a 'space' that support the physical and virtual interaction and learning, the concept of Learning Commons become more significant. As a relatively new concept, Learning Commons is often being called interchangeably with other terms such as information commons, knowledge commons, research commons, learning centers or just commons (Thorne, et. al. 2013; Weiner, et. al. 2010; Lippincott, 2007; Bradley 2004), as its function is to support learning. The Learning Commons is a place where the self-directed learning occurs through social interactions and communications which information turned into knowledge (Bailey and Tierney 2008; Bennett 2008; Lippincott 2006; Somerville and Collins 2008). Beagle (1999) states that the existence of Learning Commons which focuses on community building place is derived from the evolution of information technology centers which already exist in many

libraries or resource centers (Beagle, 1999). According to Lippincott (2006), most of the information commons exits as part of the renovated library buildings, and minority are being built as new buildings, while small numbers of these commons are in non-library buildings.

Previous literature discusses the components of Learning Commons into several components or contexts which include the physical space or place, the virtual features and the social or cultural elements. It has been clarified that Learning Commons comprises both physical and virtual space which provide resources and values as a platform for access to and advocacy for ideas (Kranich, 2003; Beagle, 1999). However, according to Bradley (2004), Learning Commons is about the relationships and community between the creators and users of the information rather than just about resources. The purpose of this article is to propose a conceptual framework for a study on the characteristics of Malaysian community learning commons specifically focusing on the state mosque library. The objectives of the study are to: a) explore the Malaysian Muslim communities' information needs b) determine the physical, virtual and social characteristics of the Malaysian mosques Learning Commons and c) propose a framework for the Malaysian State Mosques Learning Commons.

2.0 The proposed Research Framework

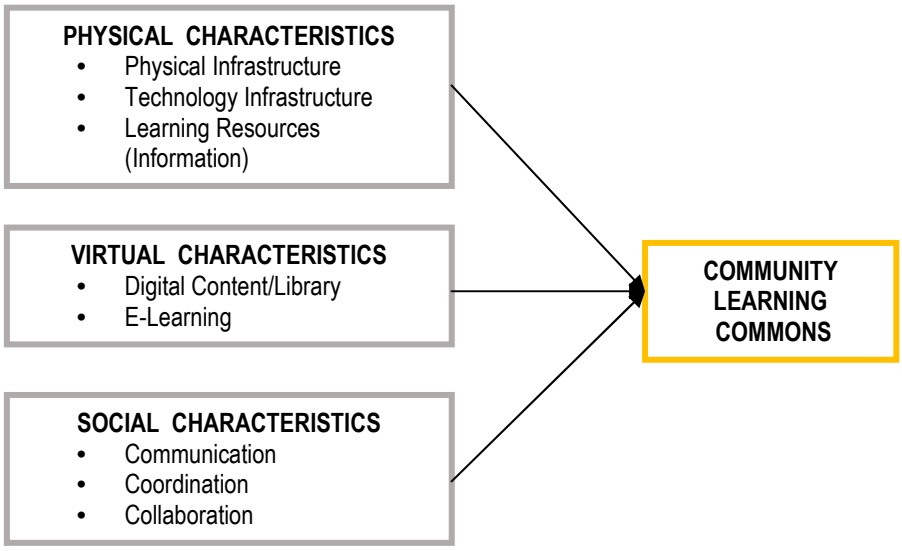

Fig 1. Characteristics of Community Learning Commons

2.1. Learning Communities

According to Coyne & Veetil (2015) learning is an evolving process which emerged as a phenomenon of imperfect human beings attempt to survive in the world. It is noted that a wide spectrum of learning objectives and communities of learners are to be served either through formal or informal education programmes (Manzoor Ahmed, 2014). The author added that the continuing education programs subscribed to the lifelong learning which hold to the concept that all citizens benefit from, and contribute to, learning and society by creating an environment of learning-friendly (Manzoor Ahmed, 2014). As each individual belongs to many different communities, the term 'Community' is defined in many different ways. Depending on the authors, the definitions of the term were being focused on different elements, which include membership, belonging, trust, connectedness, spirit, various forms of support, and the rich and productive setting that community of practice can support for learning (Dede, 1996; Rovai, 2002; Scardamalia, & Bereiter, 1994; Sergiovanni, 1994; Shea, et. al. 2005; Wenger, 1997).

Voluminous literature discusses the benefits of learning community, for example Doolen & Biddlecombe (2014) highlights that the learning communities play a role in promoting learners' success. It is also believed that a strong sense of community comforts the feelings of isolation (Haythornthwaite, et. al. 2000; Morgan & Tam, 1999; Rovai, 2002; Zhu & Baylen, 2005). While the world becomes more complex, learners are getting more unprepared for challenges therefore they need to direct their own learning, work with and listen to others, and develop ways of dealing with the complex issues and problems (Bielaczyc and Collins, 1999). The authors added that generally, through the learning-communities approach, dealing with complex issues, learners will figure things out independently, communicate and work with those from diverse views and backgrounds as well as share what they learn with others (Bielaczyc and Collins, 1999). Shea, et, al. (2005) state that community memberships encourage the likelihood of student/learner support and information flow, coorperation among members and commitment to achieve the goals of the community.

According to Laufgraben (2003), the fundamental outcomes of a learning community include: a) frequent faculty-student/learners interaction, b) frequent student/learner-student/learner interaction, and also c) time devoted to studying and learning through collaboration. However, while the conception of learning community becomes very significant in creating a vision of continuously improving learning or lifelong learning society, there seems to be lacking in advocating the concept of Learning Commons which is currently recognized as the a platform that provide and support community-focused resources (Bradley, 2004).

2.2 Muslim Community and Learning

It is important for all communities to have adequate education and its provision has to be made readily and continuously available. In the new era, learning need to be infused in on the lifelong learning model to replace the traditional approach. The notion of learning becomes very important in creating a vision of continuous learning society (Muhammad Shakirin Shaari & Zulaika Jamaludin, 2011). According to the authors, the chaotic condition widespread across the Arabs nations is self-telling about the condition of those living in the countries in which the only way to relieve the circumstances is education. Similar to other communities, all Muslims need to be given access to effective education. Muslim community regardless of age, groups and other social background must be firmly grounded to the true principles of Islam (Tauhidi, 2001). As Islam came with knowledge, the religion could not be practiced effectively without adequate knowledge (AB Halim Tamuri, Muhamd Faiz Ismail & Kamarul Azmi Jasmi, 2012). Consequently, the authors claim that this has positioned the role of mosques as education centers for the Muslim community which requires appropriate model as an idea of democratizing Islamic education to the community. Hence, there is a need for a new paradigm of learning model to be infused in the Muslim community based on the lifelong learning concept replacing the traditional 'education' (M Shakirin Shaari & Zulaika Jamaludin, 2011). To support this the author added that the Islamic learning community model supported by a proper Information Communication & Technology structure is very much needed to realize the idea.

2.2.1 Mosque as a community learning centre

As human being, finding knowledge is compulsory and important for each Muslim either formally or otherwise as in Islam we are held accountable to guide and lead others (Aminudin Basir et. al., 2015). According to Muhammad Shakirin Shaari & Zulikha Jamaluddin (2011), the current digital age requires an appropriate model and proper implementation of an effective educational system for the Muslim community which will provide an ongoing environment that continuously improve the life of the 'learners' involved. As a way of life, Muslims community goes to the mosque not only to perform their daily prayers, but to acquire and enhance knowledge of their religion as in the mosque the basics of the 'aqīdah (creed), the acts of worship and the Shari'ah rules, economics, politics, judicial, social and others are taught (Oleyade, 2014). It is since the beginning of Islamic civilization, the process of teaching and learning has been extensively associated with the mosque (Nurdin Laugu, 2007). Therefore to increase the Muslim community awareness, mosque which is already a place for worshipping, is also a base for learning knowledge and Quran (Oleyade, 2014). The importance of Mosque in Islam is undoubtedly quite clear as its policy is based on Quran and Sunnah (Umair Uddin & BadshahRehman, 2014). The authors claim that Mosque is such a university which resumes and

open throughout the year, 24 hours a day, and it welcomes every one irrespective of age, gender, color and race.

Muhammad Shakirin Shaari & Zulikha Jamaluddin (2011) further explain that one of the important element in this lifelong learning implementation is flexibility, which allows learners have their own times and places at their own pace, a new paradigm of learning need to be infused in the Muslim community based on the lifelong learning model. Therefore, everyone is welcomed to the mosque at any time without any cost where entrance is free with no differentiation between scholar and non-scholars (Umair Uddin & BadshahRehman, 2014). Most state mosques in Malaysia have libraries as part of the facilities offered to the public. It has been claimed that the library is a natural place to developed learning commons and today libraries may offer more than just electronic and print resources (Roberts, 2007).

2.3. Characteristics of Community Learning Commons

According to Holland (2015) the traditional libraries are rebranding their roles as content becomes more accessible online; from a traditional role of housing books to connecting learners and constructing knowledge. The current concept of learning commons combines both physical and virtual space that supports the process of teaching and learning. According to Roberts (2007), learning commons is a concept with a physical place and in many occurrences it exists in the library being created to support teaching and learning missions of the respective institutions. Conversely, Church (2006) describes learning commons as a physical place as well as virtual space within an innovative concept. To have a functioning learning commons will involve various elements which include; comfortable, practical and attractive physical design, readily available content for projects (i.e. library resources), seamless technology as well as production software (Roberts, 2007). As the roles of libraries and information professionals changed increasingly, information commons are transforming into learning commons (Somerville and Harlan, 2008) which reflect the "human-centered" approach (Brown and Long, 2006). These changes incorporate a deeper understanding of the learners (students) in terms of their independent and active learning behaviors (Bennett, 2003). According to Beagle (2006) describes an information commons as a cluster of network access points and associated IT tools in the context of physical, digital, human, and social resources organized in support of learning. Held (2009) suggests that, learning commons has to be a common space that accommodate various collaborative, highly flexible and technology rich activities in order to meet changes. According to Beagle "the true promise of the Learning Commons model lies in its interweaving of collaborative social resources with enhanced physical spaces, digital toolsets, and expert human support." (Beagle, 2006, p. 35)

2.3.1. Physical Characteristics

As the society lifestyle, taste and preferences changed, transforming from information commons to learning commons requires establishing leaning commons will require a community-driven approach or 'community-friendly'. It is because of the fact that the physical environment is a crucial elements of modern space of learning centers which dictates the variety of activities, events, services as well as the atmosphere and energy of the center (Thorne, et. al. 2014). Therefore, it will indisputably provide a 'space' with flexibility that supports wireless technology as well as encourage collaboration and foster creativity (Wong, 2009). For example, in accommodating the needs of learning community, the learning commons of research university libraries should provide a brand new service platform with a physical presence that integrates network, computer hardware facilities, and information in multiple formats and services. It is a gateway through which users can access traditional services and print collections, electronic information and multimedia resources, an open, free, beautiful, convenient, comfortable, flexible and functional place where users can self-study, group discuss, creative work, interactive communicate, and relaxing socialize (Leye & Liu, 2009).

2.3.2. Virtual Characteristics

The rapid development of ICT and internet technology has accelerated the creation and production of digital content and resources. Although technology is not a silver-bullet, however much of the current interest in learning has been stimulated by recent developments in technology (Fleck, 2012).

According to Taylor (2004), the advancement of the internet technology has seen the voluminous growth of digital resources. Virtually, the learning commons provides access to voluminous resources that enhance community building (Bradley, 2004). Generally, the digital libraries, by virtue of how content has been produced and made available, can be grouped into three categories(Mahesh & Mittal, 2009):

a) born digital (the content is created in digital form with the purpose and understanding that the content is primarily meant for storage and use in digital form)
b) turned digital (contents that are in analog form such as the printed books are converted to digital form; digitization)
c) gained digital (content turned digital at some source which library is not associated with the creation of content but acts as a facilitator to access the licensed resources such as the e-journals, e-books, databases)

In this twenty-first century era, an appropriate way to support learning is via information and communication technology (ICT) (Smith & Barrett, 2014). In this context teaching and learning tools within the virtual environment includes; text chat, verbal discussions, write, draw and paste images on a shared whiteboard, and the ability to view and share documents and resources (Michael, 2012). However, according to Smith & Barrett (2014), most of the research on e-learning is largely within the higher education sector rather than research on its use outside higher education context. However, according to Bennett (2003), often one tend to rush in figuring out the physical layout of the space (furniture and equipment) rather than focusing on its services to support learning with digital content and technology. Gernerally, the , all kinds of internet virtual community allows a communion, interaction, cooperation and sharing environment exploring knowledge portal and integrating library resources, navigation and repository (Shuhuai et al., 2007).

2.3.3. Social Characteristics

We learn many things through our socialization process as learning may occur anywhere either in a formal or informal context. Therefore, according to Lippincott (2010), the key aspect of learning is the 'interaction' between members in the learning community. The author observes that learning commons may supports the social facets of learning as it promotes leisure behavior such as chatting or talking with friend, relax socializing or making plans for non-academic activities. Beagle (2006) states that "true promise of Learning Commons model lies in its interweaving of collaborative social resources with enhanced physical spaces, digital toolsets, and expert human support" (Beagle, 2006: p. 35). In this context, the learning commons can support the social aspects of teaching and learning (Lippincott, 2010). This is because the advancement of internet and social networking technologies is reshaping the means by which information and culture are created and shared between individuals, groups, and societies (Somerville & Brar, 2010).

Although establishing learning commons has been a tendency to focus more on the technology aspect, what is unique and differentiates between learning commons and libraries is the collaboration and partnerships that may occur in the commons environment (Thorne, 2014). Furthermore, according to Beagle (2006), the transformed Learning Commons is a gateway to the full spectrum of information services (print and electronic); a showplace for innovation and new ICT; a place for reflection and communication, as well an inviting and inspiring place for research, learning and reading. Therefore, activities occurring within a learning community should be associated and interrelated to one another as to advocate the environment of knowledge sharing that promotes sharing of expertise and learning.

3.0. Conclusion

Based on the framework depicted above, a study on the characteristics of Malaysian Muslim community learning commons specifically focusing on the state mosque library may be executed. This study may adopt a mixed-method approach by combining both qualitative and quantitative approach. Two phases of the data collection will be engaged; Semi-structured Interviews followed by a survey. Upon the exploration from the literature review, further investigation will be conducted through the semi-structured interviews. Consequently, as the second phase may involve a survey

questionnaire. As the total population of the community more than 170,000 people with majority of them are Muslim, every year there are more than 1000 registered students (aged 19 to 85) enrolling into the mosque formal Islamic classes. These numbers exclude those enrolling into other programs/trainings offered by the mosques as well as those who perform their prayers at the mosque throughout the day. Through this study it may capture the insights of the information needs among the Malaysian state mosque community as well as their learning requirements. The findings of the study may use as a guidelines for libraries (mosques) to strategize their learning commons provision to their stakeholders.

Community Participation in Jayapura Process Development Program: Towards Good Governance

Suwandi (wandi1212@gmail.com)
University of Cenderawasih Jayapura Papua Indonesia

Abstract

Community participation in every process of public policy making is essential as the mirror principle of democracy in a country. This becomes particularly appropriate when community participation later became one of the principles which must be implemented by the government in efforts to achieve good governance (good governance). The importance of participation and participation of community that is given is supporting the success of the program that is given by the Road Infrastructure Development pemerintah.Program Jayapura city aims for the welfare of society in order to access the community in activities could be easier that way initially not deserve to be passed during the rainy season because The expected participation of the community to solve the existing problems in the village. This research is an explanatory research with the approach used The with quantitative approach. The study was conducted in the city of Jayapura. Data collection technique is by distributing questionnaires to 80 respondents. The results showed that community participation in the planning stages, expediency and evaluation is good. The planning, implementation and monitoring have significantly influence woth participation rate ($p < 0.05$). Community participation in the implementation of the program of Jayapura city government is determined from the level of community involvement in the planning stages. The resulting regression coefficients entirely positive sign, so it can be interpreted that many people involved in the planning, implementation and monitoring of the participation in the programs of Jayapura city government will increase. Partial test results of each independent variable also gives the conclusion that all variables significantly influence the participation rate ($p < 0.05$).

Keywords: Community Participation, Development

1. Introduction

The Community Empowerment approach holds that before community members will address particular social change goals introduced from the outside, they must first be organized and empowered to address their own concerns and goals .It begins with a true dialogue in which everyone participates equally to identify common problems and solutions. Once the individual strengths and the shared responsibilities are identified, the network begins to work together toward a common goal. The construction carried out by government development efforts undertaken an ongoing basis and in accordance priorities covering the whole life of the people in Indonesia. The existence of laws - No. 32 of 2004 on local government directed to encourage equitable development and development results in improving the welfare of the people, by exploiting the potential of being owned in particular rural development **(Achmanu, 1990).** Willingness of the government to understand the importance of community participation in development planning and development itself is a step forward **(Sumarto, 2003).**

The construction carried out by government development efforts undertaken an ongoing basis and in accordance priorities covering the whole life of the people in Indonesia **(Supriady, Deddy and Riyadi. 2005).** To realize the goal of nation and state are listed in the national development goals, namely to protect the people and the country of Indonesia, realizing the general welfare, the intellectual life of the nation, participate in the establishment of world order based on freedom, lasting peace and social justice. Regional autonomy as a form of decentralization of government, essentially shown to meet the interests of the nation as a whole **(Sumarto, 2003).** This policy is an attempt to get closer to the goal - the goal of governance

mwujudkan ideals to better society, a more equitable society and prosper. The existence of laws - No. 32 of 2004 on local government directed to encourage equitable development and development results in improving the welfare of the people, by exploiting the potential of being owned in particular rural development **(Achmanu, 1990).** In the context of Rural Development, Participatory it became so important, not only targets Development village, but also because most received the impact of the program is the village community itself **(Adisasminta., 2006; Hidayat, 2005; Sumarto, 2003)**

Willingness of the government to understand the importance of community participation in development planning and development itself is a step forward **(Sumarto, 2003).** Exploiting the potential of being owned in particular rural development will be a means towards the welfare of the people **(Kartasasmita, 1996).** In the context of Rural Development, Participatory it becomes so important, not just target Rural Development, Petapi also because most received the impact of the program is the village community itself **(Adisasmita, 2006).**

2. Literature Review

Community Participation

Participation can mean an activity to evoke feelings and to include or take part in activities of an organization **(Hidayat, 2005).** Therefore, the participation of the center of attention because of its position which is important in the scope of the employment relationship **(Sumarto, 2003).** Participation is defined here as the participation or involvement of mental and emotional someone in a group situation prompted him to donate contributions for the purpose of the group or organization and together account for his involvement. **(Sumarto, 2003).** From here compared to alternate actions to be taken, finally gave birth to a specific action and manifest behavior. From this behavior can be tangible participation **(Hidayat, 2005).** Participation of the Community in this context is also the involvement of individuals in total (body, mind, matter and sense) and their willingness to support keberhasialn an activity **(Supriady, 2005).** Public participation can be improved by giving a fillip to the community **(Rukmana, 1993).** This is because all the activities derived from public funding sources, can be controlled directly by the public **(Sumarto, 2004).**

In general, participation has the objective of creating a shared vision, building plans, brainstorm, determine priorities / make a choice, aspiration / input, and gather information **(Siagian, 2005).** From the opinions above can be concluded that the public participation really - really effective community involvement when it occurs in the whole process of development activities which starts from the process of planning, implementation, monitoring, and maintenance up to the involvement in the fruits and benefits of development activities

Development

Development is a business growth and change that is planned and carried out consciously by the nation, the State and the government, towards modernity in order pembinan nation **(Rukmana, 1993).** The concept of development is an effort to make changes towards a better direction than previous condition **(Suryono, 2001; Syafiie, 1999).**

The approach in development activities oriented society, must be changed with the development approach centered society **(Yuwono, 2001).** Along with the development of the concept and implementation of development in many countries, Indonesia also experienced a shift in paradigm of development, ranging from strategy people centered, to community empowerment strategies are regarded as an alternative to the development of society **(Department of Public Works, 2009).** It is at least conformed The new direction of development, such as siding and community empowerment.

Infrastructure refers to the physical systems that provide transportation, irrigation, drainage, buildings buildings and other public facilities are required to meet basic human needs in the social and economic sphere. **(Andrew, 2005; Kodoatie, 2005).** The definition of techniques also provide public services the important one. As already mentioned that the system infrastructure are the main drivers in the economic system therefore each design of each system as well as the whole infrastructure should be done in the context of integration and comprehensive.

3. Methodology

This research is explanatory which aims to test the hypothesis that there is a relationship between participation in planning, implementation and monitoring of participation in government programs Papua Jayapura city. The research variables were four: planning, execution and supervision as independent variables and participation in program participation as the dependent variable. The research is descriptive with quantitative data not qualitative. Respondents who studied amounted to 80 respondents drawn proportional random sampling. Measuring instrument is a questionnaire containing 40 items Likert scale questions. Analysis of the data used is multiple linear regression analysis with SPSS software version 20.

4. Results

Background characteristics of the respondents is high school education (35%) and undergraduate S1 (31%). In the urban community, it appears that the level of primary or secondary education is not much. This description is explained on a small proportion of respondents with elementary education. Data characteristic of most age-based respondents in the age group over 50 years (68%), while in the age group of less than 50 years is as much as 32%. Job characteristics respondents were also scattered in various types such as: employees (29%), housewives (22%), self-employed (13%), civil servants (13%), traders (11%), labor (4%), retired (3%), professional workers (3%) and farmers (2%).

The regression analysis that describes the influence of the planning, implementation and monitoring of participation in Jayapura city government programs described in Table 1 below.

Table 1. Regression Analysis

Model		Unstandardized Coefficients		Standardized Coefficients	T	P
		B	Std. Error	Beta		
1	(Constant)	5.924	2.917		2.031	0.046
	X1. Plan	0.240	0.073	0.320	3.299	0.001
	X2. Implementation	0.231	0.086	0.294	2.683	0.009
	X3. Supervision	0.224	0.084	0.262	2.660	0.010

$R^2 = 0.526$, Adj-$R^2 = 0.508$; $F = 28.144$ ($p=0.000$)

Regression analysis shows that there were significant combined effect of the three independent variables on the level of community participation with a contribution of 52.6%. The resulting regression coefficients entirely positive sign, so it can be interpreted that many people involved in the planning, implementation and monitoring of the participation in the programs of Jayapura city government will increase. Partial test results of each independent

variable also gives the conclusion that all variables significantly influence the participation rate ($p < 0.05$). Based on the already standardized coefficients (beta), planning has the greatest coefficient in comparison to the other is 0.320. The results of this analysis provide interpretation that high community participation in city government program because Jayapura successfully involve the community early in the planning stages of programs that will be conducted

Early stages of development is the Planning / manufacture the decision is: an activity ranging from identifying the needs of the community until the establishment of development programs. People who became the object of development must be fully involved as the society that will be more understanding or grasp of the perceived flaws in society collectively by a village meeting **(Andi, 2009).** Furthermore, the implementation of development requires the direct involvement of poor beneficiaries of development (participatory development) in the form of thought as the information in the development, where only the community participation program recipients, the outcome is in accordance with the aspirations and needs of the community itself **(Astuti, 2014).** With the contribute ideas in the form of advice and input, the fruitful development results in accordance with the wishes and utilization for the community by holding a (building) that unplanned change, believes that community involvement will determine the success of the development **(Mansor 2012).**

Participation in the actual construction should be carried out or implemented through community participation in contributing to support the implementation of development are tangible energy, material (money, goods) or the other and the information that is useful for the implementation of development, willingness to contribute labor and materials is a form of public participation in the implementation of development **(Bergh, 2014).** With the participation of the community in the form of mutual cooperation personnel or material donations, is a form of social support in the community receive the results of development responsibly. This shows that community participation in development of mutual cooperation in the form of donations of material as a support and a sense of belonging to development outcomes **(Soekanto, 2005).** The construction is very imply direct involvement in the public program beneficiaries development (participatory development) because it is only with the participation of beneficiary communities the results of this development program will be in accordance with the aspirations and needs of the community itself. With the results of this conformity pembagunan the results will provide optimum benefit to the community needs.

Supervision is a series of activities to be carried or held for the improvement and assessment in order to achieve the objectives as planned **(Rukmana, 1993; Daim, 2010).** It is important to know to what extent the work already carried out, evaluate and determine corrective action or follow-up, so that development work can be improved implementation. Thus supervision is all business, activities or actions to identify and assess the implementation of the tasks or activities carried out run in accordance with a predetermined plan.

5. Conclusion

Public awareness is high enough to participate in development because people want to feel the benefits of development. From the level of community participation are quite diverse, so the role of socialization of the government to the community is important. Lack of socialization or a further appeal to the public regarding any developments that will be conducted will impede public participation. Involvement of the community is very large, the people will know the process of planning, implementation and evaluation. Communication between village government by the people is good enough so that the information will be up to the community entirely.

Abstract

Sustainable development (SD) has become a direction of the present century like automation began to dominate economic growth since the last century. There are two major directions in which SD acts: macro-Level (country, cities) and micro-Level (companies and its town and regional areas). Rules and legislation at the macro level is manifested in companies. So the macro concerns have been adopted by most companies. In the last decade, sustainability has increasingly become an integral part of the company in any industry. Based on the three pillars of SD (economic, social, and environmental) companies adopt new strategies in order to optimize processes and develop a competitive advantage. The aim of the study is to identify opportunities to reduce fees by adopting sustainable practices in their processes. A review is carried out of the current status and is used to support the analysis of existing data at national and international level. Finally it presents a software tool for assessing the overall index of involvement in sustainable development.

Keywords: Sustainable development, competitive advantage, practices, development.

Introduction

Sustainability is an increasingly common practice in more companies in order to develop competitively. There are many different definitions of sustainability, but the most frequently cited comes from the World Council on Economic Development, which advocates operating in ways that "meet the needs of the present without compromising the ability of future generations to meet their own needs" (Brundtland, 1987). The 1972 Conference of the United Nations of Human Environment in Stockholm, presented a new model of economic growth compatible with environmental protection and social rights. Starting with this year and so far there are over 60 interpretations of this concept, including social welfare, environmental protection and economic development (United Conference).

From this basis, SD had different interpretations. In fact, SD current activities involve the use of resources without breaching planetary boundaries (Rockström et al. 2009; Gerst et al. 2013). It is therefore a need for a simultaneous and balanced approach of the responsibility for the problems of resource allocation, natural resource consumption and income distribution (Costanza et al., 2007; Farley et al. 2013).

Most company managers see sustainability as an important step in the success of their development (Domil et al., 2013; Cioca et al., 2007). What are the best practices implemented? What are the benefits obtained? These are two keys questions that companies address in their implementation of this concept. In fact, SD should be implemented in organizational culture. This starts from the individual (individual applied sustainable practices), the company, the cluster, then nationwide (sustainable practices applicable to the country / world). However, despite numerous corporate sustainability reports describing sustainability as "the way we do business competitive," most

business leaders do not understand clearly how to incorporate sustainability in their decisions and in company processes.

The adoption of sustainability practices in the company's activities contributes to a range of opportunities and benefits, including reduction of fees (in the field of power generation, environmental taxes on cars, et al.). Starting from the definition of sustainability, this paper identifies opportunities offered by SD for tax reduction. Systematization of the SD concept is shown in Table 1 (International Organization for Standardization, Carroll et al, 2012; Chorafas, 2011; Cioca et al., 2015). Also included are defined three areas: economic, social and environmental.

Table 1 Implications of sustainable development

Dimensions to be developed	Definitions and implications	How?	What is to be sustained
Environment	The impact of the campaign activities on the environment broadly natural resources usage, rejecting the entire nature, territory occupation.	Linked BY Only Mostly But And	Biodiversity Ecosystems
Social	Social consequences of the company as a whole its representatives: employees, solicitors, clients, local community		Cultures, Groups Social Development Places
Economic	In collecting financial performances, the SD means taking into consideration the long term perspectives of the companies, their impact on the economic growth in their field of activity and obeying the ethical principles in business		Ecosystem resources Taxation Financial resources

Economic and social implications of sustainable development

Based on the concept of sustainability, and analyzing dynamic business environment it is seen that money are circulating bidirectional and natural resources turn into resource for the company and eventually turn into waste. Thus the concept of macro- economic sustainability can be summarized as in Figure 1 (own development).

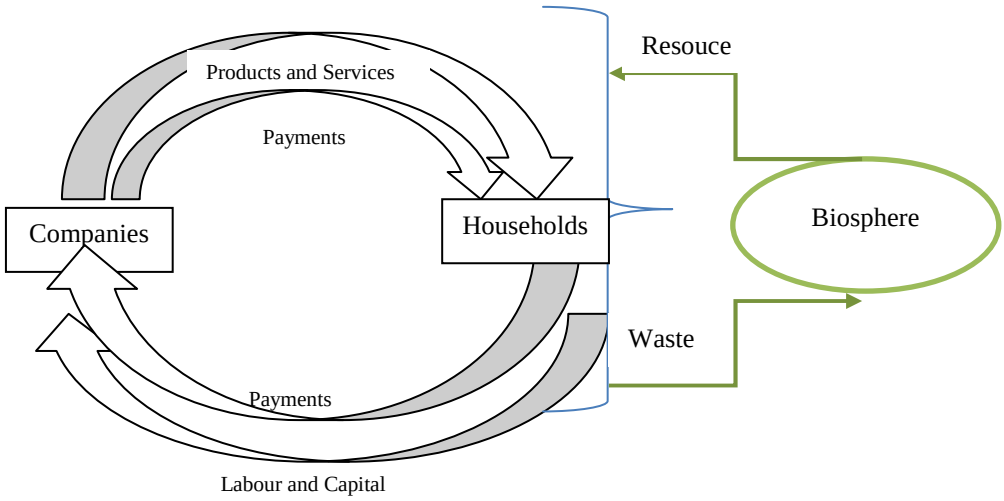

Fig 1. The concept of sustainability of macro-level

Therefore, the resources used in production processes are part of nature and the implementation of rules and procedures that lead to reducing the use of these resources are appropriate at the macro level. Further there are presented a number of implementation measures that support reducing taxes for companies that align with environmental requirements (reducing resources, lowering CO2 pollution, reduce greenhouse gas).

From the perspective of the economic pillar of sustainability, starting from the macro level actions must be implemented in order to develop sustainably. Sustainable development at the macro level contributes to reducing the value-added tax (VAT), corporate tax or income tax because living standards have to be increased in terms of sustainability. VAT is acknowledged to be among the taxes least detrimental to growth. This idea is in contradiction with statistics showing that an increased level of living leads to the generation of more waste and use more resources. So an acceptable level of national taxes contributes to SD.

Reduction of income tax and social insurance contributions helps increasing labor supply and demand, leading to a higher employment rate, lower unemployment and greater use of labor (Murin, 2014). Reducing corporate tax will reduce capital costs and lead to capital accumulation and investment in research and development, which will mean faster economic growth and productivity. In Table 2 indicates the quota levels for a selection of countries. In Romania, VAT decreased currently recording a new rate of 9% for food. In terms of income tax and corporation tax, Denmark recorded the highest rates and Romania the lowest.

Table 2 VAT standard rate, income tax, corporation tax (Source: NIS, 2015)

Country	VAT standard rate			Income tax - rate			Corporation tax - rate		
	2009	2010	2011	2009	2010	2011	2009	2010	2011
DK	25	25	25	59	59	59	35	35	35
HU	25	25	25	56.4	56.4	56.4	34.4	34.4	34.4
CZ	19	20	20	41	41	41	25	25	25
RO	19	24	24	16	16	16	16	16	16
AT	20	20	20	50	50	50	25	25	25
FR	19.6	19.6	19.6	45.8	45.8	46.7	34.4	34.4	34.4
IT	20	20	20	45.2	45.2	45.6	31.4	31.4	31.4
EU	19.3	20.4	20.7	37.1	37.9	36.8	23.5	23.3	23.2

From a social perspective according to Eurostat estimates, in 2060, Romania will occupy the 5th position among EU countries with high share in GDP of social protection expenditure (after Greece, Luxembourg, Slovenia and Cyprus).

Environmental implications and emissions of greenhouse gas

Taxation is one policy instrument available for environmental protection at macro level. When deciding on a specific direction, each country should carefully review the range of measures that could be used to achieve its objectives. A detailed analysis of the costs and benefits of each approach and an assessment of current practices should be conducted in order to assess the impact on the development environment.

Each sector generates greenhouse gases (GHG). Some sectors, such as energy, transport and construction sectors generate a significant amount of GHG. These GHG have a global impact, and

these effects are beginning to be felt, especially by temperature changes. So these GHG lead to additional costs and a good management would reduce polluting factors. National taxation has an important role in this regard. Evaluating these GHG levels in Romania, it is observed that some sectors pollute aggressively.La nivelul Romaniei, sistemul de impozitare pe domeniile poluatoare este diferit. Impozitarea se realizeaza si in functie de emisiile de GHG si de implicatiile companiei in actiunile de reducere a acestor emisii.

By analyzing the amount of C02 in Romania and EU level, Figure 2 (a, b), it is observed that electricity and heat production pollute the most, followed by transport. Romania's situation is similar to that found in the EU. The solution to improve the C02 emission in the transportation sector was to introduce an expensive tax for cars non-compliant with the Euro4 emission standard (the Euro4 emission standard specifies a maximum limit of 25 mg/kg particulate matters (PM) and 250 mg/kg of nitrogen oxides (NOx)).

Thus, the population should buy the cars with the Euro5 and Euro6 standards. For vehicles with Euro 6 no fee is charged, so purchases of cars that pollute as little as possible are backed. So, the Euro5 emission standard requires reducing emissions by 80% compared to the Euro4 emission standard, allowing 5 mg/km of PM and 160–180 mg/km of NOx. The Euro6 emission standard reduces the values of NOx in comparison with Euro5 to 1 mg/km of PM and 40 mg/km of Nox (Cioca et al, 2015).

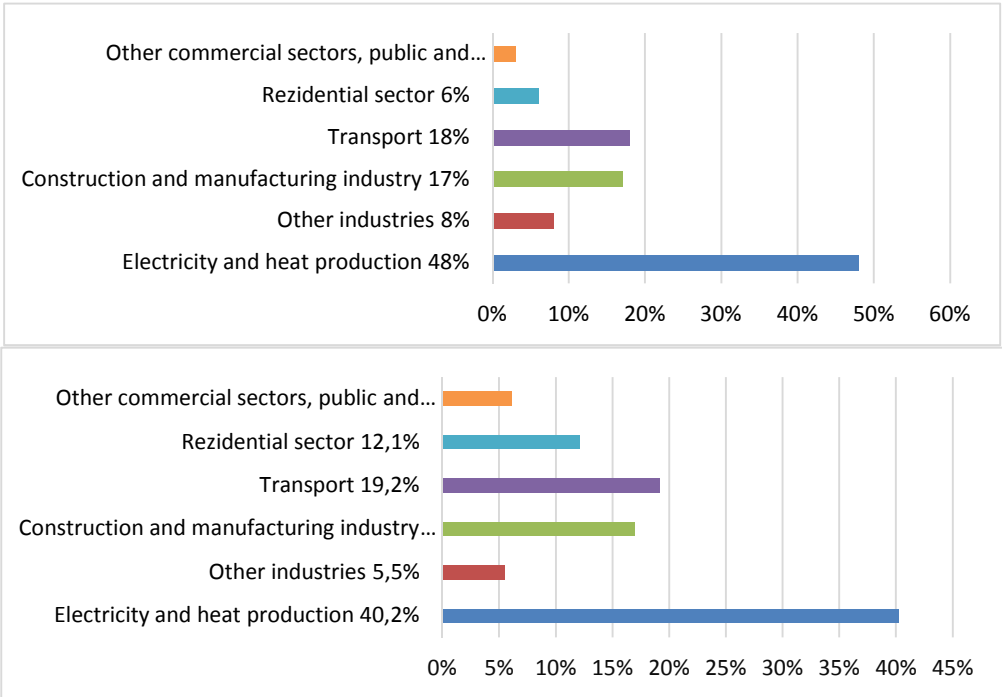

Figure 2 (2a) The CO2 emissions of different business sectors in the EU. (2b) The CO2 emissions of different business sectors in Romania (Source: NIS, 2015)

In terms of energy there are a number of financial incentives (for example in Romania, reducing consumer prices, annual incentives, reducing local taxes, subsidies granted by the state) that lead to the use of renewable energy to reduce consumption. In the EU, renewables are shown in Figure 3: renewable energy sources for electricity (RES-E), renewable energy sources for heating and cooling (RES-H&C), renewable energy sources for transport (RES-T), renewable energy sources for industry (RES-I) and renewable energy sources for residential (RES-R). RES-E is clearly the most important with an expected value of 50% until 2050 and an increase of 35% until 2020.

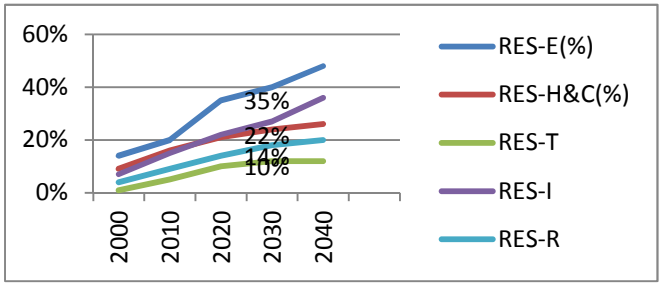

Fig 3. RES indicators at the EU level Source: (Cioca et al, 2015)

The EU legislation on minimum excise duty rates on energy products are justified on the basis of CO2 intensities of different fuels[1]. All these directions support SD at the macro level to reduce natural resources.

The focus is on generating resources on its own, through various technology supported at international[2][3] level, but also on reuse. Thus, another direction intensely debated is the waste management, which emphasizes the reuse of municipal waste. In Europe, we currently use 16 tons of material per person per year, of which 6 tons become waste. From this perspective, waste recycling at EU level speaks of circular economy of waste removed from the production of items and reused in other processes[4]. The intensity of waste reuse at EU level is shown in Figure 4.

Note that both the EU and in Romania, the amount of municipal waste per capita fell in 2013, due to different rules that directs companies to reuse. In the EU, in Denmark, Switzerland, Lithuania, Latvia, Poland and the Czech Republic the amount of waste in 2013 increased compared to 2003 (NIS, 2015; EE, 2014). In Europe there are actions at the macro level, through which towns are implementing various strategies in the direction of CO2[5] reduction.

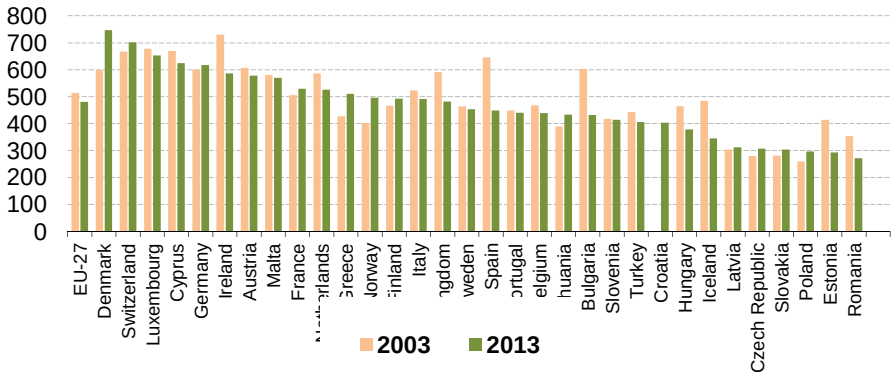

Fig 4. Municipal waste generated by country in 2003 and 2013 (kg per capita) (Source: NIS, 2015)

From the perspective of environmental implications there are certain rules to reduce taxes in order to use the techniques and technologies that consume fewer resources and generate more benefits.

Software framework for assessing the overall index of involvement in sustainable development

The concept of SD involves the implementation of actions to reduce GHG provided in GRI and cost optimization across the company. This part of optimizing costs leads to quick implementation of these software solutions. To assess the overall index of involvement in SD a software tool was developed that is based on the indicators provided in the Global Report Initiative (GRI), which indicates the degree of involvement in SD for a company. The algorithm is based on the three pillars of sustainability (economy, society and environment) with all the life cycle phases and related information about the company. The interface is shown in the Figure 5. To estimate the degree of involvement in the sustainable development model (1) was used in which the level obtained is noted by SD and the pillars used are: economic (Ec), social (So) and environmental (En). These dimensions of sustainability (Ec, So, En) are evaluated quantitatively by assigning a score based on the level met for each indicator within reporting ($\boldsymbol{w_{Ec}, w_{So}, w_{En}}$).

$$S = \begin{cases} Ec \\ So \\ En \end{cases} = \text{f(Ec, So,En)} = w_{Ec} * Ec + w_{So} * So + w_{En} * En \qquad (1)$$

This is a dynamic assessment tool that includes indicators in three dimensions. Because we cannot speak of SD without risk assessment, as risk can be found in each activity or process, the software solution involves risk assessment also, for which finally a report is obtained with measures for prevention and treatment for extremely serious or grave risks and with a high probability of occurrence.

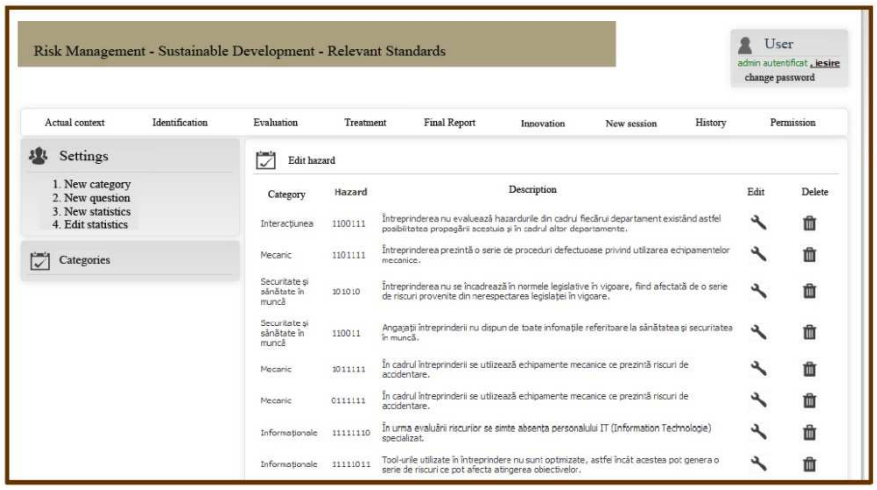

Fig 5. The assessment tool for sustainable development

The solution for evaluating the degree of involvement is dynamic and can be updated depending on the field of activity.

Conclusion and opportunities for tax incentives

Looking at the business environment, it has a complexity in which its interactions have become more uncertain, more numerous, more complex, new types of exposures, emerging risks, and old types of risks were amplified. We're talking about the need to adapt the notions and elements from literature to the needs of micro or macro change or improvement in the company's environment (Seran et al., 2014).

Sustainable development can help companies to identify, quantify, and attract opportunities and tax incentives related to alternative energy, energy efficiency, involving social issues and the environment protection. The opportunities offered by SD answer the question:

- Is your organization paying a significant amount of tax?
- Is your organization actively involved in SD?
- Does the organization try to reduce the total cost by implementing the concept of "going green"?
- Is involvement in society a priority issue for the company?
- Does the organization adopt new directions in terms of waste recycling?
- Is the use of "green technologies" a priority in your activities?

To act in this direction means to anticipate potential long and short-term consequences of an action in today's global market. The involvement of companies in the direction of SD and the implementation of decisions in this respect delivers real business value and increased competitive advantage.

The problems affecting the sustainability are the opposition between the needs of increasing population on the one hand and the planet's resources and the continuous degradation of the environment on the other hand, different interpretations associated with this concept have been developed, speaking in literature of: think green, green manager, green marketing, green hotel, green innovation, green economy, green audit and others. It speaks of a limitation of the concept, practically parallel with the definition from the "real" literature.

Abstract

The paper shows the important role of the banking system in Romania for the national economic stability by analyzing three main directions: the evolution of banking system, quality of services and strategies applied to the banking institutions. As a benchmark for the evaluation of the national banking system legislative rules and developments at European level are used. The banking system is the most sensitive national economy mechanism. On the one hand, the privatization and restructuring of the banking system and world economic instability on the other hand, led to a considerable increase in foreign capital in banking system assets (over 85%). There are presented the main stages of the Romanian banking system integration in the European banking system structure and strategies, and at the end of the paper the conclusions.

Keywords: Economic stability, strategies, banking performance, service quality.

Introduction

Since 2007, when unstable economic climate began to be felt, the financial crisis, the European Commission undertook a comprehensive reform of the financial services sector in Europe. The objective of the reform is to develop a solid and stable financial sector, essential for the real economy, by addressing deficiencies and weaknesses highlighted by the crisis. Financial instability started with easing lending conditions in the United States since 2001 (Satzinger et al., 2015). When granting credits the income was not taken into account so the banks have granted loans to low-income customers. Real estate loans had fixed interest rates in the first 2 years, then variable rate.

The stability of the banking system in Romania recorded major changes. Starting with 2006, interest rates have reached 18%, so bank customers had to think strategically. Growing offer in the property market, determined property prices to fall and so the value of the houses came under mortgages. At the same time trust of the holders in financial securities decreased and they proceeded to sell them. The main changes in the banking system in Romania aims: change of names, opening of branches of foreign banks in Romania, establishing branches abroad (e.g. Cyprus) and licensing of banks (e.g. Millennium Bank).

The impact of economic instability crisis on the banking system in Romania materializes in different directions: defining new conditions for contracting the products, restricting the share of assets in the system, reducing the liquidity, reducing broad profitability and maintain the solvency ratio at a comfortable level following stagnation in lending and asset quality deterioration.

In order to counteract the effects of economic instability, the banking institutions have taken a number of measures resulting in the strategies and business models. These are discussed in the fifth section of the present paper.

National stability is a prerequisite for the functioning of the national economy and can be characterized by a situation in which the economy does not register: imbalances that could cause a negative correction in financial markets, the emergence of a financial crisis or inability of financial

institutions to conduct specific financial transactions. The role of banks in maintaining financial stability is complex because it holds a significant share in the financial system. Analysing the current situation of Romania, as it happens also globally, there are recorded stability imbalances, i.e. the state of financial crisis. Therefore, the banking system has an important role in the country's economic condition, and this paper evaluates the elements of the banking system that contribute to exiting the financial crisis, i.e. the installation of financial stability.

To assess the role of the banking system in the national economic stability, the authors first identify the key stages that outlined the current banking system. Further, the authors evaluate the European context and the GDP level consistent with Eurostatt data. This economic situation affects the functioning of the banking system and the strategies they develop. These economic situations influence the fees of the bank products and services developed.

The key stages in the evolution of Romanian banking system

In the year 2014 in Romania there were registered 40 banks from which 38 credit institutions with private majority ownership, 34 credit institutions with foreign majority ownership and 9 branches of foreign banks (Popovici, 2014). On the banking market in Romania, there are two types of banks: commercial banks and credit unions. Romania's banking system knows beginning with 1990, a dynamic evolution that has contributed to maintaining a relatively stable banking market. In this respect, Table 1 presents the evolution of the banking system in Romania in terms of defining stages (Ionescu, 2012)

Table 1 The key stages in the evolution of banking system

Year	Activities and implications
1990	Romanian Commercial Bank (BCR) takes over the commercial activities of the National Bank of Romania (BNR) and price liberalization occurs.
1996	This year, only four banks remain licensed as a dealer in the foreign exchange market and the other are receiving the broker quality. There were a total of 40 active banks in the banking market in Romania.
1997	All banks receive back the foreign exchange dealer license on the market, the exchange rate and the foreign exchange market are liberalized. Indirect instruments are used as levers of monetary policy implementation and the elimination of quasi-fiscal constraints. - BNR goes in debt to the banking system, this amplifying monetary policy management difficulties
1998	Romania undertakes to refrain from placing restrictions on payments and transfers for current international transactions and not partake in currency commitments without IMF approval. BNR follows the operating principles of a modern central bank.
2000	This year, based on National economic development strategy of Romania in the medium term, BNR has developed medium-term development strategy of the banking system. This strategy was aimed at creating a sector with strong banks growing quality banking services and enhancing the competitiveness of the banking sector - The adoption of a regulation of money market operations in accordance with the rules and practices of the European Central Bank - At the end of the year 33 banks functioned as Romanian legal entities and 8 branches of foreign banks.
2002	This year is characterized by the harmonization process with the EU provisions (of rationale for issuance and use of electronic payment instruments) - Also this year is aimed at harmonizing regulations with the principles of the Basel Committee, namely to ensure a framework for policies and procedures for customer due diligence. - Number of banks at the end of the year is 39, compared to 41 banks in the market at the end of 2001.
2004	On the foreign exchange market intervention strategy changed by reducing their frequency.

	- In terms of the origin of the invested capital in existing banks and branches of foreign banks on the Romanian banking market at the end of 2004 the first three places were occupied by Austria (24.6% of aggregate capital), Greece (10 , 1%) and Italy (8.4%). - Currency system is balanced, and direct exposure to shocks resulting from changes in the exchange rate is minimal
2005	Adoption of inflation targeting strategy took place. - Denomination of the national currency (1 RON = 10,000 ROL)
2008	This year in the banking market in Romania worked 43 credit institutions. - Due to the financial crisis, the banking system went from excess liquidity to liquidity shortage, from excessive lending to a lower pace of credit growth - In the fourth quarter started an intensive process of attracting deposits begins
2010	There is capital increase of banks in real terms by + 9.1% compared to 2009 - NPL ratio has increased from 7.9% to 11.9% - Resizing the territorial network, banks have closed a total of 225 units - Of the 42 banks, 20 institutions have had profit at the end, the rest incurred losses. Total loss of the banking system was 305 million RON.
2014	There are 40 banks in Romania, from which 38 credit institutions with private majority ownership.

This evolution of the banking system brings about a sound system, which registered an entity with 40 banks in 2014, which was aligned to the national and international requirements of economic development. The stability of the banking system and its operational capacity contribute to maintaining the national financial stability.

The economic context in the European Union

European Commission (EC)[1], stated that the economic outlook for the European Union (EU) will further experience a period of growth and states that "Europe's economic recovery, which began in the second quarter of 2013, is expected to continue spreading across countries and gaining strength while at the same time becoming more balanced across growth drivers". EU Gross domestic product (GDP), which rose 0.12% in 2013, is now expected to rise 1.5% this year and 2.0% next year, while growth in the euro area, which was -0.4% for 2013 as a whole, is expected to be 1.2% in 2014 and 1.8% in 2015. The tax characteristics have to be followed and measured to increase national competitiveness (Kucerova, 2014). Inflation, unemployment and GDP indicators are analyzed to characterize the economic system in Romania compared to the EU. Thus, in Table 2, these indicators are systematized.

Table 2 Real GDP, Inflation and unemployment rate in the EU

Type	Real GDP			Inflation			Unemployment rate

From the data presented in Table 1, it is observed that:
a. In the EU, GDP is expected to record a 2.2% value in 2015, while Romania will register 2.5%. Romania's situation follows EU path, so the situation is acceptable;

b. In regards to inflation, EU records for 2014, 1.2%, while in Romania there is a double value, 2.4%. The lowest rate recorded in the same year by Greece, followed by Latvia. For this indicator the situation in Romania is not good compared to the EU;

c. Regarding unemployment rate at EU level in 2014, registering a value of 10.7%, while in Romania the level recorded is 7.2%. Austria has the lowest unemployment rate, i.e. 4.8%. Romania is below the EU, so this indicator has an acceptable situation.

As a final result, we can accept that Romania is following EU in terms of GDP trajectory. Regarding unemployment, Romania records a favorable situation taking into account the different economic indicators and economic climate instability. For the period 2010-2014, inflation and unemployment are shown in Figure 1. It is noted that the unemployment rate was lowest in 2011, 4.2%, while the maximum was recorded in the years 2013 and 2014. Regarding inflation, the maximum is recorded in 2011, namely 3.9%.

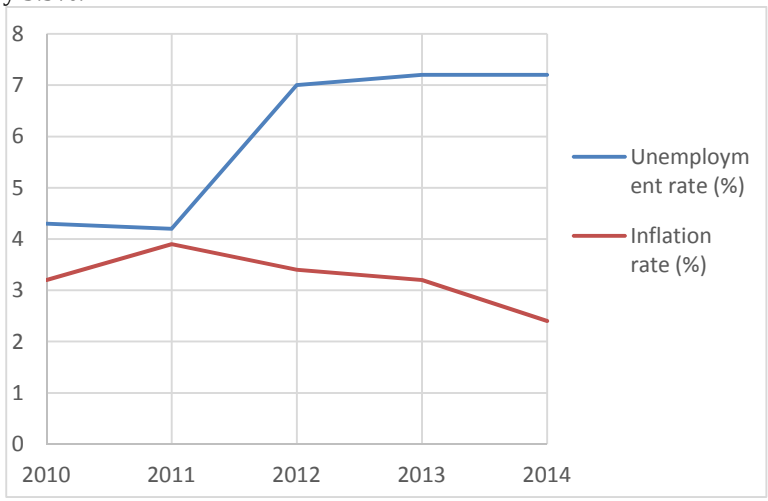

Fig 1. Rate of unemployment and inflation rate in the Romania ***Source: INSS (2015)***

Domestic and international economic situation influences the fees that are established in each country. Analysing the banking system, which is an important component of the financial system, the authors are assessing the influence of GDP and the economy in the banking services and products taxes.

Bank taxes and implications

The banking system in Romania offers a range of innovative products and services adapted to new technologies. In return, the fees and commissions are high. In Romania, the bank taxes exceed the average level of EU member states. A European Commission study (2010-2012) shows that Romania places with the highest costs related to a payment account. Figure 2 indicates the levels of fees in different countries. Note that in Romania, these costs exceed the average for the European Union, a

difference of over €50. These levels started to decline lately, but the relationship with other European countries is maintained.

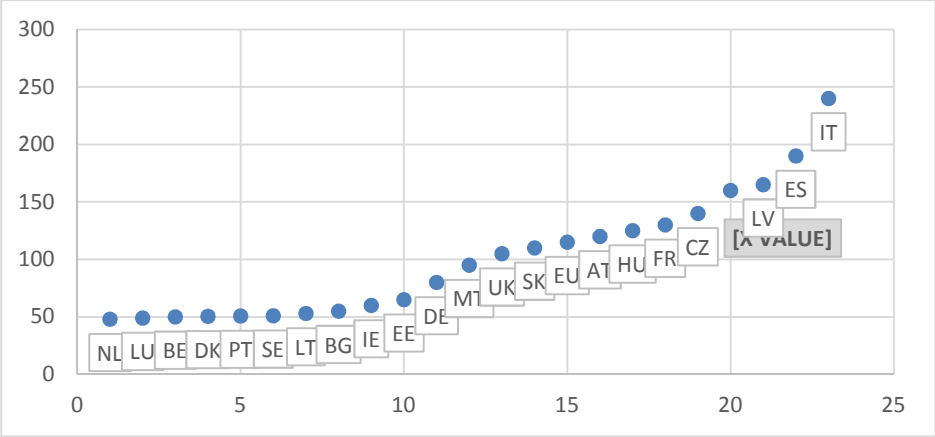

Fig 2. Taxes in the banking system

Bank charges analyzed concern: monthly current account management, issuing account statements, internet banking, debit card management, cash withdrawals (own ATM or other banks) and international transactions, et al.

Romania's banking system had 91.7% (Table 3) private majority ownership in the year 2014. This level is maintained each year. Foreign capital in 2013, is available in 90% of banks. The HHI score was 806 in 2014, which means that the market concentration is low.

Table 3 Herfindahl - Hirschmann Index and indicators for first five banks between 2008 and July 2014

	2008	2009	2010	2011	2012	2013	2014
Share in the total banks assets of private majority ownership (%)	94.6	92.5	92.4	91.6	91.6	91.5	91.4
Share in total banks assets of foreign ownership (%)	88.2	85.3	85	83	89.8	90	81
Share of first five banks in total banks assets (%)	54.3	52.4	52.7	54.6	54.7	54.4	53.9
Herfindahl -Hirschmann Index (HHI)	926	857	971	878	852	821	806

The high fees, low HHI value indicates the low degree of competition and high barriers to consumers for changing banking services provider. A series of regulations and strategies are needed for removing barriers to change banking provider.

Mapping banking system to service quality dimensions and new strategies

The evolution of the banking system, the national and international economic situation (assessed by GDP), banking products and services taxes, contribute to defining an optimum banking framework for overcoming the crisis. This output and the economic crisis lead to national economic stability, more or less. The development of a optimal banking system, balanced and durable, is done also by identifying quality services and developing new strategies. These strategies are developed according to the banking evolution, the fees and other features existing previously presented.

It is noted that the Romanian banking system has the following characteristics: low density in the number of banks (see Table 3 - HHI), high commissions for customers (see Figure 2) medium technological implications (see Mocan et al., 2015; Russian et al. , 2015), increased emphasis on the "bank and society" concept (Mocan et al., 2014), majority foreign capital (see Table 3) and private majority ownership (see Table 3). These characteristics of banks are weighted by national and international economic situation (see Table 2; Figure 1; and Artene et al., 2013). For mapping the banking system towards a sustainable system based on quality service and sustainable strategy, a questionnaire was applied to the banking professionals, and managers. They yielded 35 responses, its purpose being to highlight customer expectations regarding the evolution of the banking system in the medium term and also client characteristics. Data analysis and presentation in detail is the subject of further research, and for this work there were extracted central elements contributing to the theme addressed, i.e. mapping of Romanian banking system towards new sustainable strategies based on quality.

The banking system consists of several elements: computer networks, software, rules and procedures, human resources and databases. There are a number of classifications of the success factors that help the smooth functioning of the banking system (Seddon, 1997; Delon and McLean, 2008; Romi, 2013; Romi, 2015). Nationally these factors can be divided into four categories, Table 4. These have two directions: the quality and performance of infrastructure and the quality of human resources. These are the directions that contribute to the development of a competitive banking system that meets customer requirements.

Table 4 The classifications of the success factors

Success Factor	Definition	Local application
System Quality	All of the operating components.	Easy to learn, ease of use, ease to apply, user preemptive, flexibility, adaptability, compatibility, updating, and integration with another systems.
Information Quality	The quality of information sent to customers and staff	Availability, timeliness, relevancy, accuracy, systemic, completeness, structure, and interpretability.
Service Quality	A set of features that contribute to the delivery of quality services	Services reliability, assurance, security, accessibility, and placement.
Human Resource (HR) Quality	The quality of personnel that meet the needs and desires of customers.	Level of training, satisfaction, communication (verbal, nonverbal, body language).

Source: Adapted from (Delone & Mclean, 2008; and Romi, 2015)

After determining the characteristics of the banking system, Figure 3 shows an updated model for the banking system. Mapping the current system toward one adapted to the dynamic economic environment involves two directions to be continually updated: requirement analysis and technological capabilities analysis. Functional requirements refer to business and related products, on the one hand and accessibility and security from a customer perspective. Non-functional requirements include features obtained through the market research that has been performed. Technological requirements relate to the infrastructure used by banks and customers and the services offered by different providers of banking (Internet, Cloud Computing, Software, Hardware Components, et al.).

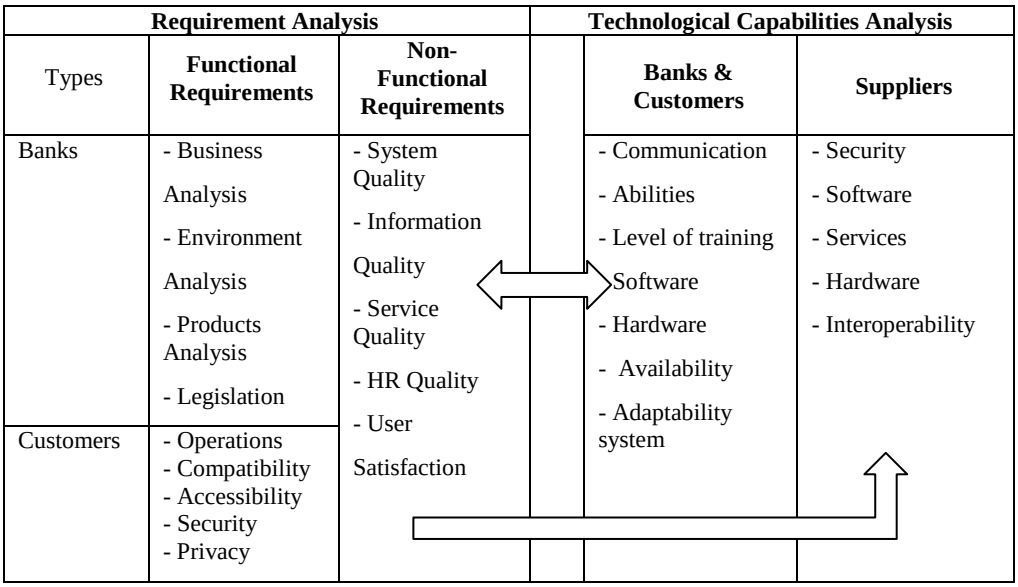

Fig 3. Preliminary model of a banking system

The results show that the overall strategy to be developed is centered on customers and the dynamic of the development environment. A strong influence is given by the situation in Europe and contributes to banks' desire to align internationally.

Results and limitations of the study

According to the Romanian Association of Banks, the banking system has demonstrated structural stability during 2014 by optimizing loan portfolio through an extensive process of cleaning the balance sheets and retains the ability to grant loans at a similar level as before downturn. In June 2015, the solvency ratio was 18.07% that is a high enough level. Romanian banking system did not need during the economic instability to be backed by public funds, being among the few systems from the EU that have experienced this situation.

In the composition of the Romanian banking system there are found 40 credit institutions, distributed by the end of 2014 as follows: two banks owned by state, three institutions with majority domestic private capital, 25 banks with majority foreign capital, nine branches of foreign banks and credit co-operative organization. The share of foreign-owned institutions' assets in total assets of the Romanian banking system increased 7% from December 2011 to December 2014, reaching 90%. From the perspective of the shareholder, the Austrian capital banks hold a market share of 36.7%, followed by banks with French capital with 13.3% and Greece 12.4%. -Hirschmann Herfindahl indicator registers a value of 806 in the year 2014, this is quite low.

As seen in previous research presented, the Romanian banking system registered from 1990 until now, the ability to adapt to economic conditions. So it has the capacity and power to contribute to exiting the economic crisis as banks represent the largest share in the Romanian financial system. National and international economic developments influenced the fees charged by banks for their products and services. These fees have been updated in line with national economic strength, so the banking system positively contributes to financial stability. And finally, the banking system must implement their development strategy based on the industry’s key factors that. These factors have been identified by applying the questionnaire survey to 35 managers of banks. The 35 managers cover 90% of the existing banks (currently 40 institutions in Romania). The development of a bank strategy helps with maintaining on the banking market. The banking system is the most important part of the financial system, so sustainable strategy in this sector leads to economic stability. This

relationship is not necessarily directly proportional, but the stability of the banking system contributes to national economic stability.

The limitations of the study refers to data available at national and international level. The data in Table 2 were taken from Eurostat. In the absence of other data, they cannot be altered by authors without scientific support, only by assumptions.

Conclusion

National Bank develops actions to achieve a safe, modern, competitive banking system that ensures the proper intermediation and receives society's trust, through systematic monitoring of the internal market for banking products and services and trends in the European banking sector. The Romania's banking system, especially in the context of international financial instability, it is recommended to maintain confidence in the investment climate which is optimum for financial intermediation growth benefiting the people, businesses and the Romanian state, so as to participate in the economic development of Romania.

The present research highlights the economic situation in Romania in relation to the situation at EU level. Based on these indicators, a mapping model is built to a competitive banking system that offers quality services adapted to the needs and desires of customers. Previous studies have shown (see Mocan et al., 2015; Russian et al., 2015; Mocan et al., 2014) strategic directions to be followed by banks to develop in a sustainable pace.

Abstract

Online shopping or e-shopping has changed the world of business and quite a few people have decided to work with these features. What their primary concerns precisely and the responses from the globalisation are the competency of incorporation while doing their businesses. E-shopping has also increased substantially in Malaysia in recent years. The rapid increase in the e-commerce industry in Malaysia has created the demand to emphasize on how to increase customer satisfaction while operating in the e-retailing environment. It is very important that customers are satisfied with the website, or else, they would not return. Therefore, a crucial fact to look into is that companies must ensure that their customers are satisfied with their purchases that are really essential from the e-commerce's point of view. With is in mind, this study aimed at investigating customer satisfaction towards e-shopping in Malaysia. A total of 400 questionnaires were distributed among students randomly selected from various public and private universities located within Klang valley area. Total 369 questionnaires were returned, out of which 341 questionnaires were found usable for further analysis. Finally, SEM was employed to test the hypotheses. This study found that customer satisfaction towards e-shopping in Malaysia is to a great extent influenced by ease of use, trust, design of the website, online security and e-service quality. Finally, recommendations and future study direction is provided.

Keywords: E-shopping, Customer satisfaction, Trust, Online security, E-service quality, Malaysia.

Introduction

A remarkable change in the business market has been observed as a result of globalisation which has changed the way companies run their businesses. E-commerce has entirely modified how businesses are done. Online shopping or e-shopping has changed the world of business and quite a few people have decided to work with these features. What their primary concerns precisely and the responses from the globalisation are the competency of incorporation while doing their businesses (Hamza & Saidalavi, 2014). Customer satisfaction is very essential for any business (Johnston & Kong, 2011; Kim & Stoel, 2004). With all the proliferation of the web applications, e-shopping is escalating consistently in phases, and it is a portion of the entire retail process. All the gross sales together add to the complete product sales.

While it comes with an established body of literature and an extensive knowledge about the design of physical stores, the revolutionary community of online stores and website properties at the moment are beginning to receive particular attention (Liu, Mengqiao, Fang & Xie, 2008). Researchers have attempted to discover website traits which affect customers' evaluation and satisfaction (Ari, 2015; Zeithaml et al., 2002) in addition to those which affect promoting performance and e-retail results (Momtaz et al., 2011; Weather & Makienko, 2006). The actual technologies of today are vastly progressive and work best for people who know how to shape them. The online world is really unfolding; anybody can now visit their own computer systems and take good care of his or her financial business, or go online to improve their own properties. Companies also tend to be both accommodating and obstinate towards implementations of e-commerce for better profitability.

E-shopping has increased substantially in Malaysia in recent years. The rapid increase in the e-commerce industry in Malaysia has created the demand to emphasize on how to increase customer satisfaction while operating in the e-retailing environment (Mamun & Che Nawi, 2014; Momtaz, Islam, Ku Ariffin & Karim, 2011). It is very important that customers are satisfied with the website, or else, they would not return (Kim & Stoel, 2004; Trong, Vu Khan, & Gim, 2014). This specific aspect may affect their future buying decision. Therefore, a crucial fact to look into is that companies must ensure that their customers are satisfied with their purchases that are really essential from the e-commerce's point of view. With is in mind, this study aimed at investigating customer satisfaction towards e-shopping in Malaysia.

Literature Review

The introduction of e-features supplied opportunities to businesses to sustain their edge against their competitors by providing better, faster and more convenient services to their customers. Buying online is one of the biggest contributors to the speedy growth of browsing (Ari, 2015). Moreover, the internet has removed quite a few obstacles to communication created by landscape, time zones and has managed to help the "frictional" business environment (Zaino, 2002). It can help improve the business processes, and in doing so, it allows for firms to control orders digitally, thus, reducing the dependence on middleman. The waiver or reduction of charges in brokerage and service representation at the end of the day lowers the closing cost settled by customers. What is more, it makes it possible for the organization to enhance its system of feedback and customer services by means of supervising outings for the website on the net (Hamza & Saidalavi, 2014; Yang, 2001). Online programs for e-commerce are now driving firms to improved turnover, strengthened customer services and improved feedback system. The internet is currently incorporated into people's lives for their distinctive use, and is not solely just for companies. The aim of e-commerce is to strengthen customer service, to continue to maintain a very good interaction level with customers and mostly to increase the turnover of organisations (Cranor, 2003).

Customer Satisfaction

Customer satisfaction is specifically reviewed in traditional promotional literature (Mason & Bearden, 1979). Many researchers have looked at the different qualities of this particular element of e-commerce and the way various features affect the outcome of customers' satisfaction (Mamun & Che Nawi, 2014; Schaupp & Belangar, 2005). Working with the various actions indicating satisfaction and loyalty, researchers can get tempted to establish relationships using online capabilities. Sterne (1996) links the effect of high- and low-task relevant qualities on satisfaction mediated by means of reactions such as satisfaction and excitement. Nusair and Kandampully (2008) utilized atmospheric factors (e.g. songs and colour), termed as low-task pertinent attributes by Lee et al. (2011) and uncovered two factors that affect participants emotionally which in turn inspired objectives to purchase. Ballantine (2005) reviewed a good online site promoting video cameras and identified the interactivity and product information to generally be favourably relevant to customer satisfaction. Thus, companies need to provide customer satisfaction in having to create increased human relationships, some of which may not be probable, or having to rely on loyalty of customers.

Nevertheless, if just a tiny percentage of customers would make use of online cost, the possibility could be massive (Ari, 2015; Holland & Westwood, 2001). Using the online cost, a customer can make a lot of financial deals at reduced prices. The world is becoming increasingly open because of the web and the ecommerce industry.

Ease of Use

In accordance with Nielsen (1994), the methods for testing can be: Heuristic review, heuristic appraisal, intellectual walk-through, pluralistic walk-through, persistence evaluation, feature assessment, formal user friendliness check and expectations test. Heuristic review is easily the most laid-back method and requires acquiring user friendliness specialists to ascertain if each dialogue aspect follows the established heuristic rules (Trong et al., 2014). Lee et al. (2011) suggests that good

web designs can be seen in great firms and they must possess an effortless lookup facility. Shopping is assumed to generally be enjoyable and fulfilling and the promoting sites therefore must generally be organized and are easy-to-navigate. Heuristic examination is a functionality review method which will help reveal simplicity or difficulties in software design.

Online businesses can give customers more ways to secure purchases, solutions and services over the net and with lower customer service fees; hence a greater level of customer satisfaction can definitely be attained (Kim & Stoel, 2004). By using e-commerce, this can all be granted. Not only is that, customers capable of doing these particular transactions within the comfort of their own personal space. Zhang et al. (2006) discovered that this trend to offer in online sales is influenced by the affinity with the computer, its ease of use, and users' involvement in the auction. Ease of use has been deemed an essential factor in information technology popularity (Zhang et al., 2006). Hence consumers with more confidence in using technologies are more likely to do online shopping. Consequently, the two perceived factors (ease-of-use and technology stress) and morals and attitudes are estimated to influence online customers' satisfaction. Based on the discussion, this study will test the following hypothesis in the context of Malaysia:

H1: There is a positive relationship between ease of use e-shopping customers' satisfaction.

Trust

Trust on the seller is actually essential for establishing customer loyalty and having continuity in buyer-seller associations (Kim & Kim, 2006). Many researchers have asserted that trust is usually a vital link which allows relations to be built when there is scepticism, information asymmetry, and anxiety of opportunism (Hamza & Saidalavi, 2014; Pavlou et al., 2007) in the case of e-shopping (Lee et al., 2011). Any organisation that possesses a website in any case undoubtedly tries to minimise risks. High-tech techniques using shields and firewalls may help to stop this kind of fraudulent activities. However, it does not matter how much money or how innovative a technology that is being injected into obtaining an online system is, there is not a single sort of factor that has been fully tried and fully trusted upon.

Security concerns is the main opposition to going online as this can drive them to furnish details online (Heiner et al., 2006). Putting attention exclusively to the probable profit earned with the existing purchase is definitely not an option for the e-retailers. Customers need assurance from the e-retailers on their personal data to be protected. Companies that find a way to get over this kind of malicious activity after their purchase could be the companies liked by the customers who could achieve satisfaction (Daffy, 2001). Based on the discussion, this study will test the following hypothesis in the context of Malaysia:

H2: There is a positive relationship between trust and e-shopping customers' satisfaction.

Design of the Website

The contents of websites could include texts, pictures, layout and any other elements that can stimulate consumers' purchase intention (Fazli & Nor, 2010). Website designs can evoke a wide range of emotions as well as attitudes from users. It is generally suggested that website designs should consist of sophisticated media with a more realistic environment in order for users to be positively influenced in their purchase intention (Hausman & Siekpe, 2009). Website design has a direct influence on consumers' purchase intention, and website design features have positive effects on consumers' e-service quality perception.

On-line shops have to deliver acceptable functions to support the shopping demands of their customers throughout their entire decision making process (Liang & Lai, 2002). All of these factors have effect on websites. The positioning ought to always be sliced in a way to ensure less time is involved for customers to find the internet site online, which can have an effect on their response time. Internet sites with a lot of images generally tend to load quite slowly. Those who use animated

graphics may incur delays from time to time. This can put off users' for lengths of time, so this kind of delay can have considerable effect on users' satisfaction (Weinberg, 2000). Website design quality is as essential as product price, and is a bigger factor in comparison with store status. Consumers will probably check out and purchase with well-designed shops that have appealing characteristics. "Consumers' willingness to visit again is more than their own motivation to purchase again" (Liang & Lai, 2002; Trong et al., 2014).

Buyers need to generate unique decisions (using clear information) concerning prices without getting out of present- day work. The system must support undo and remodel (Momtaz et al., 2011). One of the important features that must be considered in order to design and style an excellent website, and which website builders should take into account, is handiness. Navigation selections assist people by providing a visual counsel and overall flexibility in getting around a website (Ari, 2015). Navigation possibilities are required and can simply highlight important pieces of information on the website.

Websites of better quality can attract customers' attention and bring back the users to revisit the website frequently. On the other hand, poor website quality and design de-motivate users from revisiting the website. It should adhere to real-world exhibitions in generating information and display in a normal and realistic order (Mamun & Che Nawi, 2014; Muyllea et al., 2004). It might also want to use more common and comfortable icons to generally complement the website system and other internet websites. Otherwise users might require a visible secretary to guide them through the website and this guide will go between the systems to follow a real- world idea to protect users from unawareness of any online security threats (UKOLN, 2008). However, building a good website is actually a complex task. Lots of factors should be considered. A very good design should present sufficient sensible support in order to meet customers' wants at each and every stage of his or her decision point. Based on the discussion, this study will test the following hypothesis in the context of Malaysia:

H3: There is a positive relationship between design of the website and e-shopping customers' satisfaction.

Online Security

There are malwares and spywares which could be obtained by hitting emoticons or grabbing no-cost software (Zhang et al., 2006). The particular lack of education and protection of information causes financial losses for consumers, vendors, surveillance businesses, along with any institutions connected with e-commerce (Chen & Chang, 2013). Symptoms of fraud for a vendor can be triggered via a fraud management system and screening, while for individuals it is wide-ranging and are frequently only discovered prior to people being defrauded. However, for each of these kinds of distinguishing symptoms, locating the actual hoaxes is usually identified concurrently. Waiting usually results in credit reports being harmed, bank accounts being drained, payments being questioned or perhaps purchases not acquired, although there is no easy way to recognize fraud (Chen & Chang, 2013).

People and merchants must realize the potential success of their actions and learn where they would turn out to be a victim of a counterfeit or a scam, or some other deceiving engagements. Quite a few people know that one can find bogus businesses operating online with fraudulent intents, so they are aware and recognise theft as a concern when offering their information. However, quite a few people do not realize that comfort could be hard to obtain whether it is highly valued, and security may be breached in more ways than expected (Dellaert & Kahn, 1999). The online industry continues to focus on solving the particular waiting time period by using approaches that are specialised, that are currently extremely expensive and cumbersome to hire (e.g., fiber content optic wire). These kinds of approaches are yet to, at this point in time, exhibit the desired outcomes (Weinberg, 2000).

When a consumer does a payment online, often there are risks incurred (Zhang et al., 2006). Online security works to secure privacy of online transactions and consumer's private information. In recent years, customers have become extra susceptible to security challenges on the web (Hamza &

Saidalavi, 2014). All types of information may be tracked when browsing the Web and interchanging e- mails. Information security is becoming a vital business and is a technological task for virtually any company that has an inclusion of online financial activities. For that reason and the delicateness of its routines, financial establishments must look into the overall security of their activities and operations (Grewal et al., 2004; Momtaz et al., 2011). Based on the discussion, this study will test the following hypothesis in the context of Malaysia:

H4: There is a positive relationship between online security and e-shopping customers' satisfaction.

E-Service Quality

Consumers today are more sensitive to services provided by companies to them, and good service gives them a good experience. Once customers obtain good experience from the service provided they will be satisfied and that can switch them to loyal customers. Hsuehen (2006) stated that service can be defined in many ways. Service can be defined as acts, performances and experiences. With increased competition among companies which has taken to e-commerce as well as the online channel in dealing with their customers, the concept of e-service quality has become a more important factor because it can lead to customer satisfaction as well as retention.

Over the last two decades, especially, e- service quality has been measured in different ways (Zeithaml et al., 2000). A number of studies done in the past focused on technical service quality rather than quality of service (Zeithaml et al., 2002). E-service quality can be considered as the entire process of e-service delivered through the online channel by e-service providers. Service as an intangible product gives customers different levels of satisfaction. A certain level of base service has to be given to customers to meet their basic expectations.

A lot of online shopping websites provide continuous individual support for consumers. This is predominantly for after- sales enquiries on administrative issues and provides complex support. In addition, to make it easier to use internet websites give online feed back to visit again. While with improvements should come systems without the need for paperwork, systems may still be required to present supporting documents. Such information should be very easy to seek, focused entirely on tasks, and generally with checklists defining steps to be carried out (Walsh & Godfrey, 2000). Based on the discussion, this study will test the following hypothesis in the context of Malaysia:

H5: There is a positive relationship between e-service quality and e-shopping customers' satisfaction.

Methodology

Marketing research lends itself to the belief that the actual theory can come prior to the research (Gephart, 1999) and this research can be performed to find out the particular abilities of a theory that can be tested or even falsified (Nicholas, 2000). That is why quantitative method offers more added benefits when there is variety and large amounts of customers to evaluate the research (Sekaran & Bougie, 2015). Using this approach, the researcher would be spending a reasonable length of time to collect massive amounts of customer data and produce the correct dimension of quantitative data with a mathematical analysis (Saunders et al, 2007). In this study a survey using a questionnaire has been employed. The use of survey in this study has enabled to gather a huge amount of information from a good-sized people in an extremely inexpensive method. The questionnaire items were adapted from different sources for different constructs (e.g. Mamun & Che Nawi, 2014; Momtaz et al., 2011; Trong et al., 2014). However, only items with Cronbach Alpha ≥ 0.80 were considered.

The population for this study consists of customers who use e-shopping in Malaysia. However, for this study, a total sample of 400 questionnaires was distributed among students randomly selected from various public and private universities located within Klang valley area. Total 369 questionnaires were returned, out of which 341 questionnaires were found usable for further analysis. This study choose students as sample because, students are young who tend to use more e-shopping

than older generation. After the data collection, all the responses were coded and keyed into SPSS worksheet for further data analysis.

Reliability analysis was performed using Cronbach Alpha test. As stated by Nunnally (1978), any value higher than 0.70 is considered reliable. Using the guideline, this study has achieved an alpha value of 0.863 which is above the accepted value.

Results and Discussion

This study has employed Structural Equation Modelling (SEM) for data analysis. Prior to final data analysis, EFA was conducted using SPSS to measure the construct reliability, validity and unidimensionality of the constructs. Furthermore, CFA was conducted to re-confirm the convergent validity, construct validity, discriminant validity as well as internal reliability using AMOS software. The results are presented in table 1 below.

Table 1: CFA Results

	Name of Category	**Required Value**	**Comments**
	Unidimensionality	Factor loading for each item ≥ 0.50	The required level is achieved
Validity	Convergent Validity	Average Variance Extracted (AVE) ≥ 0.50	The required level is achieved
	Construct Validity	All fitness indexes for the models meets the required level	The required level is achieved
	Discriminant Validity	The correlation between exogenous constructs is ≤ 0.85	The required level is achieved
Reliability	Internal Reliability	Cronbach alpha ≥ 0.70	The required level is achieved
	Construct Reliability	CR ≥ 0.60	The required level is achieved
	Average Variance Extracted (AVE)	AVE ≥ 0.50	The required level is achieved

Finally, SEM was employed to test the hypotheses formed in this study. For the overall model as a whole, the statistical result indicates a good fit. The complete model inclusive of the 5 hypothesized paths is illustrated in Figure 1 and Table 2. From the model, it can be seen that all the variables uphold a positive effect on customer satisfaction towards e-shopping in Malaysia.

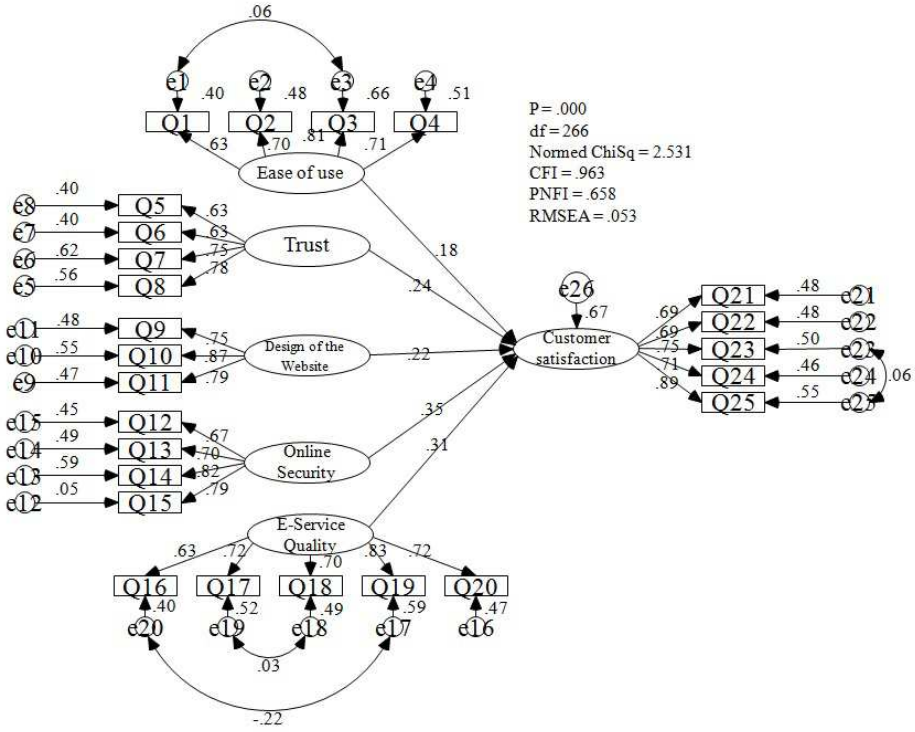

Fig 1. Structural Model of the Study

Table 2: Final Output

Name of Category	Recommended Value	Obtained Value	Comments
Absolute fit	RMSEA ≤ 0.08 (0.10 may be)	0.053	The recommended level is achieved
	ChiSq/df ≤ 3 (3-5 may be)	2.531	The recommended level is achieved
Incremental fit	CFI ≥ 0.90	0.963	Closer to the recommended level
Parsimonious fit	PNFI ≥ 0.50	0.658	The recommended level is achieved

From the above table, it can be seen that the fitness level has been achieved [Absolute fit (RMSEA) = .053, (ChiSq/df) = 2.531; Incremental fit (CFI) = .963; and Parsimonious fit (PNFI) = .658] (Figure 1, Table 2). The respective indices, namely absolute fit (RMSEA and ChiSq/df) and Parsimonious fit (PNFI and PCFI) indicates a good model fit as the values attained in each of the indices amounted to higher than the required level for achieving the model fit. However, for Incremental fit indices (CFI), the required level is well above the required value of 0.90. With the assumption that the default model is appropriate, the model fitness level is accepted as indicated by Byrne (2010) and Hair et al. (2013).

Table 3: Path Coefficient

			Estimate	S.E.	C.R.	P
Customer satisfaction	<---	Ease of use	.178	.055	3.214	.001
Customer satisfaction	<---	Trust	.244	.047	5.109	***
Customer satisfaction	<---	Design of the Website	.216	.067	3.326	***
Customer satisfaction	<---	Online Security	.351	.164	2.141	***
Customer satisfaction	<---	E-Service Quality	.308	.176	1.749	***

SEM is considered as a meaningful statistical approach for its ability to disclose the existence of direct as well as indirect relationship between variables. In accordance to the above discussion (Table 3), it can be perceived that customer satisfaction towards e-shopping in Malaysia is to a great extent influenced by ease of use, trust, design of the website, online security and e-service quality as shown by the best fit model. However, online security and e-service quality seems to be more influential elements that significantly influence customer satisfaction towards e-shopping in Malaysia.

This study suggests that e-retailers need to create some appealing image to buyers through increasing the level of security with the means of attractive marketing campaigns. Subsequently, they will be able to attract the consumers to visit their websites often. Eventually, there is need for a unique mechanism that provides hassle free and safer e-shopping experience all the way to the checkout.

Conclusion

Many researchers have been concentrating on customer satisfaction of e-shopping recently. Nevertheless, there may be a need for finer examination with customer satisfaction in unique countries. Even now, there is a big research gap in places, primarily in establishing nations around the world, which may change substantially. With the outcome of the following study, the finding shows that the higher the amount of time spent in online shopping, the higher the level of customer satisfaction as they interact more with the e-retailers. Customer satisfaction, coupled with consumer's anticipations, will be the ultimate goal of the performance of items. A lot of contented customers normally have the intention to re-purchase products in the event that product performance meets her or his expectations. It would be interesting to study exactly the same factors linking online shopping satisfaction to a different, more ordinary internet individual population.

This study has attempted to address the factors influence customers' satisfaction towards e-shopping in Malaysia and introduced some important indicators from Malaysian perspective. This study has focused on customers' satisfaction towards e-shopping in Malaysia. Thus, this study has significantly contributed to the empirical evidence of the trends in the online purchase literature. This was achieved by empirical testing of the structural relationships among variables that influence customers' satisfaction towards e-shopping in Malaysia.

Its resulting indicators will help both the academics and the people involved in the industry to understand what influence customers' satisfaction towards e-shopping in Malaysia and their revisit intention to the websites. This study finding will help to identify the requirements and solutions for defining the web policies to maximize the productivity and e-development for Malaysia.

In conclusion, this study suggests that some other variables might also be explored and a comparative study between two different countries is also possible which can add more value to the existing literature and the empirical evidence.

Abstract

Quick development of net businesses allowed to maximally using of mass creativity. Following huge supply of stock art has led to unacceptably low prices. But while the professional authors are hardly satisfied with the pricing on e-markets (especially based on the principles of RF licensing), the Internet's mass audience takes to any opportunity to earn money online with enthusiasm. This is clearly shown by the rapidly growing collections and the annually increasing sales revenues of microstock companies of all types. As we show, during the last years risk management conceptions preferably shifted to aggregation of extra large intellectual asset portfolios. Carefully studying the trends in demand, microstocks continuously adjust their business models, offering new options (extensions) to licenses, and taking into account the numerous technological and genre-based specifics in consumer activities. In this study we concern the stock digital image, audio, and text e-markets.

Keywords: asset aggregation, copyright, microstock, RF license.

1 Introduction

In recent years, an institutional group of cybermediaries has quite clearly been forming in the e-commerce market, operating with copyright assets of stock art. Despite the fact that activity in this area has its own specifics, it is possible to compare it with other type of mediation in the patent market (Millien and Lauri, 2008). The economic features similarity of patents and copyrights was discussed in early theoretical works (Watt, 2000; Landes and Posner, 1989). But we believe this similarity also to be considered in risk management principles of new cybermediaries, as comparable with large patent portfolio aggregators (Myhrvold, 2010).

The concept of product and service aggregators exists usually in connection with obtaining aggregation benefits from the concentration of different products and services (Giaglis, Klein, and O' Keefe, 1999). This concept is not associated exclusively with the products of intellectual activity. Often cited examples of such market intermediaries are travel, hotel, and transportation services, as well as the insurance, information and financial services related to them (Bhargava and Choudhary, 2004). The concept of 'content aggregator' is also well-known in e-commerce in connection with systematic collection of news or other structured information (Charlesworth, 2007). However, we believe this concept does not include the features of specific intellectual assets and essentially does not indicate their presence at all.

New intermediaries today offer consumers a wide range of products and services in the commercial digital markets of stock images (mainly photographs), video, audio, and literary (text) works. These companies provide a substantial amount of creative content and, in fact, have formed new segments in the specialized electronic market. Noted similarity of new cybermediaries with patent aggregators can be identified in their overall approach to the formation of extra-large strategic portfolios of intellectual assets. This analogy allows us to confidently call such intermediaries as *stock art asset aggregators.* The size of the portfolio (collection) of just one of them today can be tens millions of assets. For example, in 2016 the leading photostocks image collections held: *Shutterstock* (http://www.shutterstock.com) - about 80 million; *Dreamstime* (http://www.dreamstime.com) - more

than 40 million; *Fotolia* (http://www.fotolia.com) - more than 52 million and these figures are increasing every month.

On the other hand, the difference between such companies and patent aggregators is associated with the significant differences in copyright enforcement capabilities compared to patent law as a whole (Varian, 2005; Towse, 2006). In particular, copyright assets do not have any documentary title of intellectual property similar to patent registered in the Patent Office public register. Copyrights not recorded in such registers are more indistinct. Finally, the sale of the rights (licenses) to use assets (e.g. electronic image files, audio recordings, texts, etc.) has another market mechanism.

In this paper we analyze the similarities and differences between the business models of new cybermediaries operating with various assets of stock art. Then we discuss the practices of commercial turnover of digital stock images, audio recordings, and texts pertaining mainly to RF licensing copyright models both in international and Russian market. In addition, we discuss the reasons for the rapid spread of the RF model on the stock art markets as well as various improvements (expansions) to this model.

2 Digital images and audio files as base assets and the principles of their commercial sale

Sales (concession) methods have long been established in both Russian and international practices for the rights to stock imagery (unlike to custom imagery) by way of contract with the author or copyright holder. Specifically, RF (Royalty Free) licenses are usually purchased by small advertising agencies to use images in projects with low budgets or as illustrations in corporate booklets, magazines, reports, and websites. Under this model, the buyer makes a single payment and can use the image an unlimited number of times for an unlimited period. In practice, quantitative restrictions are still put in place, but the limits are usually quite large, for example, 250 or 500 thousand times. The buyer does not receive the copyright to the image with this license.

RM (Right Managed) licenses are more expensive and give the buyer limited or exclusive rights to use an image, for example, within a certain time period, for a fixed circulation, or for use with certain types of products. The advantage of an RM license is the possibility to purchase an image exclusively. Traditional agencies and photobanks (see below) selling such licenses retain information about all previous purchases, which allows them to track when, where, and by whom an image was used (ASMP, 2014).

The types of licenses, as well as their contents formed during the long history of market relations in the industry, as well as legal practices, which are the subject of constant attention from professional associations. Well known are the European CEPIC (Centre of Picture Industry), the ASMP (American Society of Media Photographers) and other communities (Carr, 2012). In the stock imagery market currently there are two main types of intermediaries:

- Traditional photostock agencies or ‘classic photobanks’;
- Microphotostock agencies or ‘microphotostocks’.

Stock raster and vector illustrations created by graphic designers, as well as video clips, are often a part of microphotostocks’ collections. In addition, many photostock agencies also aggregate stock audio files into their collections. This explained by the similarities of the basic properties and principles of the commercial turnover of digital stock image and audio files (as opposed to the text files).

We focus this study in the second segment, where buyers have independent access to collections via e-commerce networks, fixed prices, a simple and inexpensive licensing process, and a huge number of suppliers (authors) from around the world (Glückler and Panitz, 2013 a, b, c).

2.1. The role of microphotostocks in the development of RF licensing

Internet considerably forced the activity of all types of photo-agencies, which we consider as imagery aggregators. A host of photography sites, photo-club networks, photo-sharing (file-sharing) services, etc. appeared. Namely one of them has become the standard for modern models of stock imagery aggregators in the second segment – microphotostocks. The online community *Istockphoto*, which was initially formed in 2000 for the free exchange of digital photographs by web designers, is considered the pioneer of the industry. The fact was that its image base grew so quickly that it soon required significant money for site hosting and the organization of a good search function. To compensate these costs B. Livingstone, the founder of the community, first established a nominal fee for the ability to copy (download) images (Decker, 2005).

In the modern sense, namely this was payment for the RF license to use the image. The service was organized in such a way that, after each paid download by a buyer, part of the total sum went to the author, and part to the *Istockphoto* community. The first important feature of this model is that any image may be copied an unlimited number of times.

The second feature is that the price of an RF license was, and remains nowadays very low. In the majority of microphotostocks it is about $1-2. The author of the image receives a very small amount from each sale, usually between $0.25 and $0.40. For this reason that type of aggregator is called a microstock or micropayment company (Charlesworth, 2007). However, in the case of the commercial success of a particular image, the number of licenses sold (paid copies) can reach tens or even hundreds of thousands, and cooperation with aggregators becomes actually profitable for authors (Livingstone, 2007).

The commercial success of the *Istockphoto* project was fast and compelling. One reason for the success was the urgent need of many new Internet users for cheap images. The fact is that websites, presentations and advertising banners do not need photographs (images) with high DPI (Dots per Inch), which can cost hundreds dollars in traditional photo agencies. Therefore, the main clients of microstocks became web designers, mass media, advertising, marketing companies, who often require an image only as a template for their projects. As a rule, the budgets for these projects are low and do not allow for custom on-location or studio photography or RM licenses for expensive, highly artistic images to be bought.

On the other hand, amateur photographers and graphic designers received a good opportunity to earn on the imagery cyber market. In addition, at the end of the 2000s, leading microstocks also started selling ‘footage’ – short videos with a duration starting from just a few seconds. As the demand for video on the Internet and mass media is becoming higher and higher, this process attracted videographers to photostocks.

Finally, a similar business model was formed by *audio aggregators* or *microaudiostocks*, collecting commercialized digital stock audio recordings and sound effects. Moreover, due to the fundamentally similar commercial properties of image and audio files as has already been mentioned, many microphotostocks also aggregate audio collections. Examples of successful audiostocks are: *AudioMicro* (http://www.audiomicro.com); *Pond5* (http://www.pond5.com); *PremiumBeat* (http://www.premiumbeat.com).

A typical standard RF license from an audiostock may provide unlimited (including in terms of time) use of stock audio files for corporate or personal websites, slideshows, non-profit films or theater productions (e.g. film festivals, student projects, etc.), free applications or games. This type of license can allow, for example, the production of thousands of copies of DVDs or applications (games) which turn a profit. The demand for stock audio is also continuously growing. We know this industry is occupied by companies whose business is related to the ‘invention’ and synthesis of sounds and its reproduction, duplication, and sale. But microaudiostocks, as well as microphotostocks, have confidently set themselves up in the intermediary niche of this market.

2.2. Licensing innovations of microstocks

Microphotostocks and microaudiostocks gradually expanded the standard RF licenses to provide a greater variety and more convenience for their clients. New Enhanced Licenses (EL) are developed by each company individually. However, the industry is gradually creating common approaches to their content. In the range of licenses offered by large microphotostocks we can see:
Unlimited Seats license (U-EL) extends the standard RF license to an unlimited number of workers within the same organization counted as a single registered user. The total number of copies is usually fixed at 250-500 thousand.

Increase Maximum Copies license (I-EL) increases the standard RF license to a maximum circulation, usually set in hundreds of thousands of copies.

Web Usage license (W-EL) gives the right to use copies for commercial website templates, screensavers, e-cards and presentations, as well as backgrounds and sounds for mobile devices. The maximum number of copies may be set at 10 thousand (for each type of use).

Print Usage license (P-EL) grants the right to use images for printing on t-shirts, greeting cards, mugs, mouse pads, posters, calendars, and framed artwork up to a maximum number of copies, for example 10 thousand (for each type of use).

Finally, *Sell the Rights license* (SR-EL) gives the buyer full ownership, effective from the moment the image is downloaded. The buyer receives the exclusive rights for the file, but cannot claim the image was created by them and cannot resell it as their own work. The aggregator must deactivate the file in its database immediately after the sale of the license. The author is required to remove the file from other collections, where it can be sold or copied, as soon as possible, usually no more than 72 hours after the sale. The author must acknowledge and agree to provide the buyer with the ownership right to the file purchased under this license. The incentive for the author is usually a very high price compared to a simple RF license. For example, in the photostock company *Dreamstime*, the cost of a license for an indefinite period starts from $250.

The extension of the standard RF license from audio aggregators can be structured in different ways. For example, depending on genre, *PremiumBeat* offers the licenses for:

- Television and radio shows, including TV series and miniseries; television and documentary films; talk shows and reality shows; news programs;
- TV and radio advertising, taking into account the limited broadcast range (e.g. 500 km) or in the national advertising campaigns;
- Cinema and theater productions etc.

In addition, it can also cover the mass copying of files, such as audio tracks with laser discs, audio books, applications, and games that generate income. However, the price of a license for an unlimited or limited number of copies can also be sufficiently high. Standard and extended RF licenses in audiostocks provide so-called *synchronization rights* that are required, for example, to use audio files in professional filmmaking. In Russia, such rights are called as ‘screen rights’.

2.3. Microphotostocks in Russia

In Russia this business may be presented by such companies as *Lori* and *Pressphoto*. A few other companies and photo agencies also combine microstock and traditional photo stock models.

The Moscow-based company *Lori Photobank* (http://www.lori.ru) was established in 2006 and has accumulated a collection of about 18 million images and more than 200 thousand high-resolution videos. Authors collaborate with the company on a direct agency contract basis and receive a commission of between 30% and 50% from each sale. In the same way as foreign microstocks, *Lori* offers customers both standard and extended licenses to use images on the Internet, for printing, outdoor advertising, etc.

Pressphoto (http://www.pressfoto.ru) was established in 2009 in Chelyabinsk, and currently advertises a collection of 10 million photos, 700 thousand vector illustration and 300 thousand videos. Every contributor receives one of six ranks depending on the total revenue from the sales, and a contributor's remuneration is based on their rank. This company is the member of CEPIC (see above).

Russian microphotostocks are lagging behind their foreign counterparts, which can be explained by their substantially later entry into the market compared to analogous foreign companies. One likely reason for this is the lack of sufficient domestic demand for pictures of Russian subject matter, as well as the later development of related network services. Despite this, Russian photographers, graphic designers, and videographers successfully tapped into work in foreign microphotostocks in the early days of their existence.

3 Text aggregators

Text aggregators were less known in economic literature. The legal framework and financial models of the traditional publishing business did not meet the requirements of web designers, advertising, marketing companies, and other web content manufacturers. The fact is that concise texts, which are limited to the dimensions of one electronic page comparable to a conventional computer monitor, are often needed in order to fill websites. Such texts are usually made up of only a few thousand characters or hundreds of words, and never cost several hundred or thousand dollars.

As demand in the low-budget literary content market was huge and was continuing to increase in the mid-2000s, so-called electronic *article writing services*, *copywriting exchanges* and *copywriting agencies* began to appear almost simultaneously in various countries including Russia. As with microphotostocks, the idea was based on micropayment, i.e. the generation specifically of inexpensive texts. Each literary electronic platform, from the early days started forming its own database of authors and original texts, i.e. they began to fulfill the role of aggregators of intellectual assets.

3.1. Specifics of text aggregator models

However, despite the overall similarities with photostocks and audiostocks, original text aggregators (see Fig. 1) are significantly different due to the characteristics of this type of assets and the traditional business practices of the industry. In particular:

1. Most authors' revenues come from specially ordered or commissioned works. Extensive electronic catalogs of stock texts are also available from almost all aggregators, but they play a secondary role, and bring the authors less income.
2. In most cases the customers require the exclusive rights to the text. Even in those cases where the contract does not include royalty payments (RF license) it means the complete transfer of copyright to the customer.
3. Services for writing specially optimized texts for increasing the position of websites in internet search results are in high demand. This activity has the separate title of SEO-copywriting (Charlesworth, 2007).
4. As electronic texts are extremely easy to copy and edit, almost every platform has its own or ready-to-use programs to test contributors' texts for originality (anti-plagiarism).

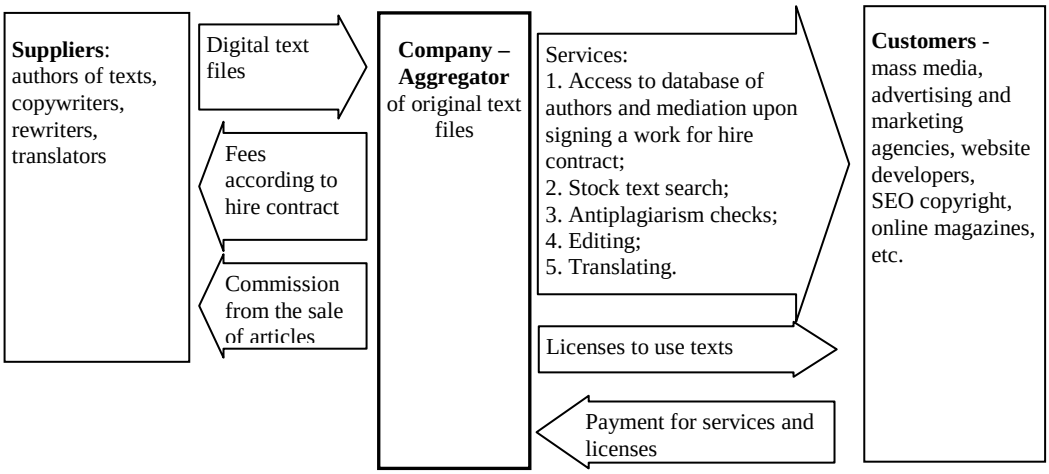

Fig. 1. Schematic diagram of text aggregator activity.

The industry pioneers and the largest text aggregators are *Textbroker International LLC* (http://www.textbroker.com), and *Constant Content* (https://new.constant-content.com). The financial and legal models of these companies have been used as a basis by dozens of literary aggregators worldwide.

The *Textbroke*r (USA) was founded in 2007 as the network service for creating unique texts. Structurally, its separate independent platforms are responsible for the texts in ten major languages, of which the authors are native speakers. All authors are continuously rated from two to five stars, which, firstly gives a clear idea of the expected level of text quality. Secondly, it determines the rate of payment, which is traditionally calculated by the word count. Using the automated service, a customer is able to select the quality level of the author, as well as the order type:

- *Open Order*s are of the simplest and most inexpensive kind. Thousands of registered contributors with relevant ratings can see and have the opportunity to fulfill them;
- *Direct Orders* go directly to the contributor who was selected by the customer. In this case, the price per word is agreed upon by the customer and the contributor, regardless of the contributor's rating. The system only sets the minimum level of payment;
- *Team Orders* can be received by a group of authors, organized on a voluntary principle. Typically, these groups are created for a specific project. The fee per word is assigned by the customer, and the system determines only its minimum level.

3.2. Licensing practices of text aggregators

The method of transferring the copyright to the customer is extremely important. On the one hand, in the 'Terms and Conditions' (customers Section 6.1), available on website (https://www.textbroker.com/terms-condition), *Textbroker* grants and licenses the customer the sole and exclusive rights to publish, perform, reproduce, transfer, distribute, create derivative works, and sell texts, which have been delivered to them, in any mass media, in whole or in part, throughout the world. However, the customer does not have the right to call herself the author of the received text, and can only place her name on the text with the express written consent on the original author (customers Section 6.2).

On the other hand, the section for authors (authors Section 6.1) states that for each text, the author gives the company the exclusive license to its use through all current and future methods, and edit and use it in its edited form. This license is not limited by time, place, or content of the text, and is comprehensive, irrevocable, transferable, and can be sublicensed.

Thus, *Textbroker* has given serious attention to the transferring copyrights. But we believe this approach is fairly simplified, as does not take into account some other possibilities for managing rights, which leads to their underutilization. In particular, the other above-mentioned company, *Constant Content*, uses a very flexible system of licenses, which allows for multiple additional sales of stock original texts. As we shown above, this practice is typical for selling copyright images in microphotostocks.

So, on the one hand, the 'Terms and Conditions' for authors (Section D, 'License to Constant-Content') states the author gives *Constant Content* the nonexclusive right to store, sell, and distribute texts on the author's behalf, as well as to use and reproduce trademarks of the author as the company considers necessary for the sale or licensing of texts on behalf of the author (https://new.constant-content.com/about/terms_conditions.htm).

On the other hand, the section for customers states (Section D, 'Consumer License'), that the texts offered by the company, are available for customers according to one of the following licenses:

- A *Use License* entitles customers to acquire, for a fee fixed by the author, a revocable, royalty-free (RF license), non-transferable and non-assignable, non-exclusive license to publish (but not to edit) a text on a single site or in a printed publication owned by the customer;
- A *Unique License* entitles customers, for a price set by the author, to acquire an irrevocable, royalty-free, exclusive, non-transferable, and assignable license to use (but not to edit) a text ;
- A *Full Rights License* entitles customers, for a price set by the author, to acquire an irrevocable, royalty-free, exclusive, non-transferable and assignable license to use and edit a text. Texts previously published elsewhere, may only be offered in accordance with a Free License or a Use License. Texts containing multimedia or other non-written digital content may only be offered in accordance with a Use License, Unique License or a Full Rights License.

Thus, using the first type of license, the author can sell a text multiple times, while the customer is entitled only to its one-time publication with reference to the author. According to the second type of license, the customer gets exclusive rights to use the text, but cannot sell it, or change the original form. Finally, the third type of license provides the customer with the full right to publish, edit, sell, or otherwise use the acquired text. In order to allow customers to make informed decisions before purchasing texts, *Constant Content* allows them to preview 50% of the text's content. It remains to be added, that the full-time staff at *Constant Content* is about 50 people, and the contingent of registered authors in 2015 exceeded 73 thousand.

Like other suppliers of stock art, original text aggregators are in the early stages of forming their business models. Many companies are just entering the market. However, the text content has found no less an extensive demand on modern electronic low-budget markets.

3.3. Russian text aggregators

The first Russian exchanges and copywriting agencies were created in 2007-2008. Today, in addition to the leaders, *Advego* (http://www.advego.ru) and *TextSale* (http://www.textsale.ru), about ten steadily developing aggregators can be found in the market and new companies appear annually.

Advego, founded in 2007, positions itself as an exchange, i.e. it considers its main function to be intermediary information and technical support for customers and authors. As the oldest, *Advego* has the most complete and thoroughly developed User Agreement (http://advego.ru/info/rules/), also including all basic terms and definitions. The model used by *Advego* for transferring copyrights is very similar to a Full Rights License, used by the aforementioned company, *Constant Content*. However, that limits the turnover of intellectual assets to a single use. *Advego* rightfully occupies the leading position in the Russian market. In particular, in 2015 company reported about 1.3 million registered users and around 30 thousand operations every day.

TextSale, also founded in 2007, positions itself as a 'service for the purchase and sale of content from independent copywriters'. Its activity is focused towards the sale of unique stock articles on an

extremely diverse range of subjects. In 2015 the company reported on more than 320 thousand original articles with a maximum of 20 thousand characters. Every daily digest provides a brief description of 300 new articles. Company has several tens of thousands of registered authors, each having a constantly updated rating (1-5 stars), depending on the number of articles sold, the level of quality (i.e. passing the antiplagiarism test), and customer feedback. In turn, since it is a work for hire contract, the rating affects the price of the article, starting at $2 per thousand characters.

In contrast to images and audio microstocks, Russian literary aggregators are developing more confidently, as competition from foreign companies is virtually nonexistent. This can be easily explained by the complexity of the Russian language as a whole, rich Russian literary tradition, and the presence of a large number of professionally trained editors, linguists, journalists, and translators. In addition, work in literary stocks is good practice for university students.

4 Conclusions and discussion

The paper shows that primary stage of accumulating microstock collections was accompanied by extremely simplified, in many cases even the primitive RF licensing models. To this end, dumping prices for stock art were used. On the one hand, this was met with sharp opposition from communities of professional authors; on the other hand, it opened the market up to a mass unprofessional, but creative audience. Now, expanding businesses, microstocks gradually increased their requirements for the quality of content and offered customers a variety of improvements and extensions to standard licenses, which actually allowed the conditions for the transfer of rights, similar to those of an exclusive license, and the complete assignment of rights. In addition, the modern RF license also takes into account many technological and genre-based characteristics of specific cyber market segments.

We believe the low-budget segments of the e-commerce market have become a breeding ground for the emergence of a new financial cybermediation institution on the intellectual property market. Several new types of companies we can confidently combine under the general title of ‘intellectual asset aggregators’. At first, having built a successful business model for the multiple sales of stock art, microstocks provided material interest for the ongoing participation of various categories of authors, from students and advanced amateurs to professional photographers, programmers, writers, linguists, journalists, translators, etc.

Secondly, the low prices for stock works, simplicity and ease of licensing and the large variety of related services have attracted growing attention to microstocks from return individual and corporate customers. For example, according to the findings of *LEK Consulting, LLC* (http://www.lek.com), the total volume of the commercial digital images market alone stood at $11 billion in 2011, and can reach $13 billion by 2016. At this volume the sales of microphotostocks and other types of stock images are growing annually by 15-20%, and this increase can reach $3.5 billion by 2016. This research was commissioned in 2012 by the *Shutterstock, Inc*. (Shutterstock, 2013).

An informal but highly reliable confirmation of this we found in the annual readers’ polls carried out by professional designers’ magazine *GDUSA*. Its readership consists of professional buyers of digital images, so it provides a good representation of consumers’ perceptions of the market. In particular, surveys in recent years have consistently confirmed that designers prefer to buy stock images from microphotostock agencies (more than 90% of respondents), with over 30% of them purchase 100 or more images per year (Kaye, 2012 and 2014).

Our further research is based on the real copyright asset portfolio sales statistics. For empirical study we try to adaptation of financial engineering risk evaluation metrics to the classes of assets meant above. In particular, there is known methodology of Value at Risk (Earnings at Risk) models adjusted for copyright asset sales specifics. We hope our findings will be useful both for the intellectual asset portfolio theory development and for the risk management theory at all.

Breakthrough Innovation Development within Established Enterprises: Entrepreneurial Behavior and Agile Approach

Georgy Laptev, Innovation Business & Entrepreneurship Lab, Faculty of Economics
Lomonosov Moscow State University, Moscow, Russia, glaptev@econ.msu.ru

Dmitry Shaytan, Innovation Business & Entrepreneurship Lab, Faculty of Economics
Lomonosov Moscow State University, Moscow, Russia, dshaytan@gmail.com

Abstract

Breakthrough innovation product development within established enterprises is a big challenge. Internal procedures and business processes of established enterprises, as opposed to startup companies, are more standardized and formalized. Consequently, the speed and flexibility of decision making and implementation of employee's ideas is greatly reduced. But explorative type of works at the initial stage of breakthrough innovation product development process is full of uncertainties and requires flexible approach in management. To resolve the contradiction the entrepreneurial and agile management style are required. In this paper we propose the management model "lean startup within the enterprise" that helps to achieve success in breakthrough innovation product development within established enterprises. The model was verified during our acceleration programs for technology entrepreneurs and consulting activities for established enterprises.

Keywords: breakthrough development, established enterprises, entrepreneurial and agile approaches

Introduction

One of the main reasons of a high failure rate of innovation products and too low lifetime value is that created products do not meet customer needs and their desires. Development of a breakthrough within established enterprises is a difficult task and most executives admit that innovation engine in their companies doesn't hum the way they would like it to. In most cases the efforts to jump-start innovation through cash awards for a useful idea and improvement suggestion forces frequently prove fruitless. Bright ideas and great intentions remain in the heads of employees. The reason why this happens is the following. Internal procedures and business processes of established enterprises, as opposed to startups, are more standardized and formalized. The speed and flexibility of employee's decision making and implementation of their ideas is greatly reduced for this reason. This is typical also for the process of new product development. On the other hand, explorative type of works at the initial stage ("fuzzy front end") of innovation product development (IPD) process is full of uncertainties, poorly formalized and requires flexible approach in management. This is especially relevant to breakthrough (disruptive) innovation product development that could generate new growth for the business by reaching new customer segments or new markets and often through new business models. Thus, there is a need to find managerial models and tools to resolve the contradiction. Transformation of sundry innovation efforts into a function that operates consistently requires new organizational structures, tools, and new management style (entrepreneurial and agile).

Lean product management and MVP within established enterprises

In this paper we propose the management model "lean startup within the enterprise" to achieve success in breakthrough innovation product development within established enterprises. The main idea is to build quickly and validate product concepts in a form of minimum viable products (MVPs) through iterating and pivoting based on market feedback. Then the MVP, selected based on market/customers acceptance, proceeds to the further development in more structured stages of IPD process (see Fig 1). We adapt the MVP approach, initially developed for startups by E.Ries (2011) and S.Blank (2013), for the case of established enterprises. In the model proposed here the agile/interactive approach, in contrast to the traditional "waterfall" approach developed previously by R.Cooper (2001), allows us to overcome uncertainty of the initial stage of the IPD process more successfully.

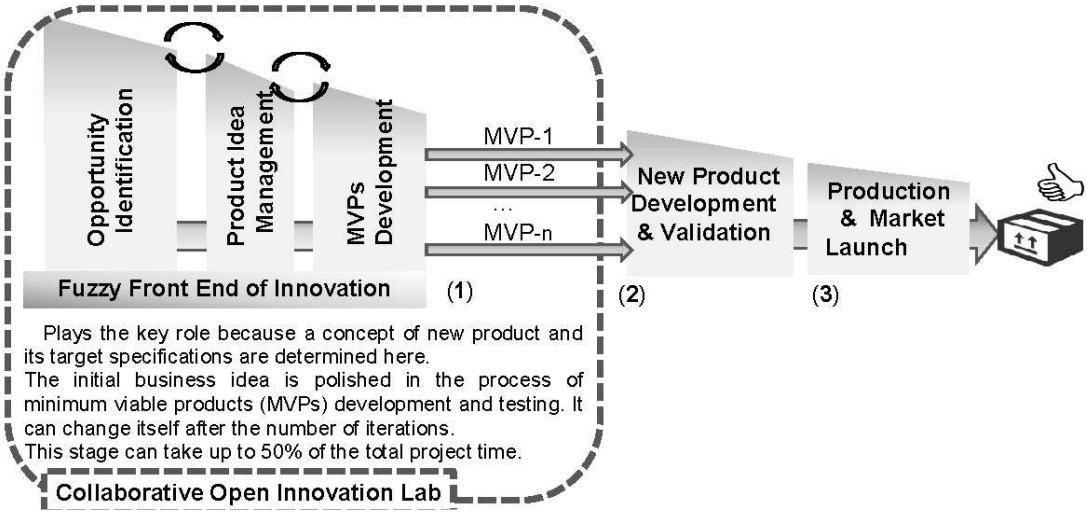

Fig 1. Process of innovative product development (IPD) within established enterprises

In the PDMA Toolbook by P.Koen et al (2002) the initial stage of the IPD process called “Fuzzy Front End of Innovation” (FFEoI). The FFEoI is an area of search and zone of uncertainty, tacit knowledge and conflicting organizational pressures. Activities in the FFEoI are unstructured and often difficult to anticipate and perform. Yet they are crucial to successful outcomes of the process IPD, because a concept of a new product and its target specifications are determined here. This is the stage where product developers/innovation managers suffer from a deficit of information and meaningful customer insights, which they require to help them to make design decisions.

Against of such uncertainty and ambiguity, it is easy to understand why the FFEoI is first and foremost about learning in order to identify and recognize an opportunity. This is because the focus in FFEoI is on acquisition, synthesis, creation and sharing of relevant knowledge and insights that help in opportunity identification, mapping, ideation, prototyping and MVP development and validation.

We divide FFEoI into the following phases: opportunity identification, product idea management and MVP (product concept) development and use effective tools and techniques for managing the critically important FFEoI in each of these phases.

The second stage of the IPD process is called “New Product Development and Validation (NPD&V)”. The third stage is called “Production & Market Launch (P&ML)” and consists of production, marketing and sale of the developed product (see Fig 1). NPD&V and P&ML stages are more formal, structured and focused on execution of the IPD project.

Our practice shows, that the FFEoI stage of the IPD process remains one of the weakest from the managerial point of view for both startups and established enterprises. To achieve the success in the IPD within product driven enterprises we propose to organize a Collaborative Open Innovation Lab (COI Lab) that will work as an independent unit (subdivision) with direct subordination to the head/first deputy head of the enterprise and is intended to bring customers deeper into the FFEoI stage of the IPD. The knowledge and insights captured from collaboration with a potential customer is fed directly back into the early stages of MVP design and development, allowing the COI Lab team to further clarify directions and make critical improvements.

The COI Lab plans, designs, and runs activities in the FFEoI stage using tools, methods and all the resources of a multi-disciplinary team which includes an anthropologist/ethnographer, industrial designers, a human factor specialist, rapid prototyping and usability professionals. For a particular IPD project, the permanent COI Lab team (3-7 people) is enlarged with invited experts in the specific areas corresponding to the project. This inter-disciplinary approach guarantees that many unique perspectives and personalities assure connection with, observation, and extraction of feedback from customers. Tabale 1 shows the COI Lab team activities in the FFEoI and examples of tools and techniques.

Table 1: COI Lab activities

FFEoI phases	Activities	Examples of Tools & Techniques
Opportunity Identification	-Collecting customer insights -Sense making and opportunity mapping	Ethnographic (design) research Customer & technology trend analysis Road mapping
Product Idea Management	-Idea generation -Idea selection	TRIZ Design thinking Lead user Rapid foresight
MVP (product concept) development	-MVPs creation -MVPs testing -MVPs selection	Rapid prototyping Testing Selection

The COI Lab multi-disciplinary team is fully involved in opportunity identification, idea generation and testing, MVPs creation, testing and selection based on market/customers acceptance. Successful product must meet three different conditions: (1) desirability (usability) by people – it should meet latent needs, behaviors and desires; (2) feasibility in terms of technical consideration and mass production; and (3) viability in terms of business aims and economic conditions. The first two conditions are satisfied by the COI Lab team by means of the created and market/customers accepted

MVP. The third condition is assured by enterprise top management and COI Lab team. In the management model that we propose, once the created and successfully tested MVP meets all conditions, it is passed to the NPD&V as a next stage of the IPD process (see Fig 1).

Entrepreneurial behavior and key competences in entrepreneurial management are important factors for the COI Lab team success. In a research study by G.Laptev (2014) et al formulates the competencies, that are critically important for innovative entrepreneurs, and form two clusters: cogitative (creativity, intuition, analyticity, flexibility of thinking, risk tolerance and decision-making) and personal (pro-activity, ambition, motivation of achievements, competitiveness, perseverance, self-confidence, focus on the result, optimism, perfectionism).

We conclude that the sustained development of successful innovation products in complex and uncertain environments can occur only when the conditions for FFEoI activities are provided via the enterprise organizational capabilities and innovation management. Differences in the content of each of the FFEoI activities challenge management of the FFEoI stage of breakthrough innovation development within established enterprises and require acquisition of additional competencies in entrepreneurial and product management. Leadership, culture, and business strategy define the environment for successful breakthrough innovation product. Culture that encourages freedom of creativity is a key enabler. The proposed in this paper management model "lean startup within the enterprise" helps to achieve success in breakthrough innovation product development within established enterprises. The model was verified during our acceleration programs for technology entrepreneurs and consulting activities for established enterprises.

Generation Y – Trends and Challenges for the Retail Market

Ştefan Alexandru Catană, Bucharest University of Economic Studies, Bucharest, Romania,
stefan.catana@mk.ase.ro

Abstract

In this article we want to analyze the behaviours of Generation Y analyzed by specialized studies and to emphasize some aspects that can influence their buying behaviour and thus the retail market. Additionally, this article contains an analysis of the research literature and an empirical study on the activity of generation Y in relation to consumption.

Keywords: Generation Y, segmentation, retail marketing

Introduction

Segmentation is the key to efficiency and effectiveness in marketing. In this respect, it is very important to group some collectivities of society after certain socio-demographic aspects and analyze their behaviour with respect to a given situation. In this article, we intend to group generations in terms of the period in which they were born and grew up and analyze to what extent the behaviour of generation Y influences marketing strategies and tactics in retail.

Literature review

By analyzing research literature, we see that it was necessary for customer segmentation to be made, beyond age, on longer periods of time (generations), because it was found in time that the buying behaviour of consumers differs greatly from the historical period in which they were born and grew up. Research literature uses the following division in terms of generations: those born between 1946-1964 ("baby boomers"), those born between 1965-1980 (Generation X), those born between 1981-2000 (Generation Y) and those born after 2000 are considered as part of Generation Z or Zoomers. Scientific studies and materials drawn up so far reveal that there is a difference between the behaviour of those born after the 80s compared to their predecessors' behaviour. In this regard, we share Parment's idea (2012) who points out that when we want to accomplish certain strategies and tactics in retail, it is important to ask ourselves "why customers buy?". By analyzing this aspect, customer segmentation is a good marketing tool in order to find out to what extent the similar experiences lives are the source of the motivation for which a consumer prefers certain products. However, besides segmentation from a socio-demographic point of view, it is important to divide the categories of people in generations that similar historical events, that were partakers of the same technological innovations and lived generally in a similar socio-economic system. In this regard, we wish to point out that retail is directly influenced by socio-demographic characteristics of those who acquire products and services.

Research question

In this article we want to analyze research literature and to emphasize the consumption behaviour of those who belong to Generation Y and investigate to what extent the historical period in which they were born and have lived their childhood affects consumption and hence the retail market. In addition, we want to make a presentation of the consumer typology specific of the people born after 1980.

Generational profiles

The Baby Boomers

Generation Baby Boomers the largest generation working at this moment, being perhaps the greatest power at the moment in view of the fact that, overall, the top management positions in companies are occupied at this time by representatives of this generation. These people are recognized as working very hard and have a high degree of loyalty to the companies where they work. Due to financial issues, most representatives of this generation decide work even after retirement age, working as experts in their fields. Also, many Boomers have experienced many social changes in their childhood and thus they easily adapt to changes in society.

Generation X

Generation X natives are those who understand very well the principles of modern capitalism and are well suited for multinational companies that have different cultures. In general, these people tend to be quite independent, self-reliant. They appreciate flexibility and individualism. In addition, they find it natural to have access to career training, in order to develop properly. Compared to Boomers generation, these people are less loyal, this conclusion being sustained by divorce statistics, and by the fact that these people tend to change their job in a number of years.

Generation Y

Generation Y is the generation of people who were born after those from Generation X, being the children of the baby-boomers period and it is a generation that differs radically from their predecessors, and from those who are born after 2000 (Zoomers). Those of generation Y is the first generation of families in which both parents worked, being mostly the only children of their parents. Also, talking about the features of this generation, these people are educated, with a global and entrepreneurial thinking, people who had access to information much easier than those of previous generations, as the technological explosion took place in the early 90s. From the perspective of the values that Generation Y has, these young people want to be noticed, not lost in the crowd and develop harmoniously. They are attracted to novelty, being less interested in long-term planning, trusting their own strength. In this regard, Generation Y is distinguished by the ease of accepting opportunities and challenges, but also by the tendency to procrastinate certain commitments which seemed impossible to postpone for earlier generations: marriage, birth of a child, career or financial savings. Continuing this analysis in terms of the relationship with technology and digital environment, we can highlight the fact that these people need the mobility offered by new technology and digital discovery. The mobility that is provided by the access to technology and digital environment, coupled with the ease of accessing everything that pertains to the online environment, enables them to take their "office" with them wherever they are, being permanently connected to the problems that arise at work. In this respect, there are studies showing that members of Generation Y believe that it is not necessary to go to work every day to accomplish their tasks and that they can achieve it remotely. Besides what we have described above, we should also mention the fact that, in general, the natives of this generation are those who are best described by the expression "make a living" compared to the phrase frequently used for baby boomers "make a life" because, after they saw their parents working overtime, they choose to work less but more efficiently in favour of the activities that they enjoy. Also being considered digital natives, they are not reluctant to express their views on the online products and services and do this especially through social networks.

Generation Z

Generation Z is represented by young people who were born after 2000 and who have not yet entered the labour market. These people are living in the time of technology development and thus they can be considered as being the "mobile generation". Also regarding this social group, we

have to say that they have high standard of consumer and lifestyle, with appetite for mobility and for a rapid pace of life. From the perspective of the workplace, these natives prefer to work based on projects being ready to change jobs frequently. Zommers are less focused on themselves than Generation Y because they went through several global issues such as: economic and financial crisis, the fight against terrorism and environmental issues.

They believe more in ideals and are less willing to compromise when it comes to respect social values. There are studies reflecting that over 65% of this generation natives will have jobs that currently do not exist. Since an early age, they train their quick decision-making skills, adapting to the new environment, and frequent use of mobile applications. From the perspective of social networks, they are regarded as an important source of information, and dissemination of opinions.

How is the retail market influenced by Generation Y characteristics

From an economic perspective, the comparison between Generation Y and Generation Baby Boomers may be primarily highlighting that Generation Y is a generation interested in saving or investment plans over the medium and long term, being the generation that can be characterized as "spend now, save later". If we talk about those born between1946-1964 (Generation Baby Boomers), they are part of a more conservative generation, which prioritizes the issues related to tradition and customs. In this sense, the natives of this generation do not put so much emphasis on the use of modern technology when they decide to purchase a product, being attracted primarily by issues related to brand awareness. This type of behaviour directly influences overall retail activity and consumption. In what follows we will briefly present some of the behavioural differences between baby boomers and generation Y in terms of consumption, as they emerge from research literature:

Table 1: Behavioural differences in terms of consumption

Criterion	Generation Baby Boomers	Generation Y
The main role of the brand	Quality	Image
Types of attractive products	Late adoption	Early adoption
Purchase criteria emphasis	Rational	Emotional
Choice of retailer	Emotional	Rational
Choice of product	Rational	Emotional
Retailer loyalty	High	Low
Social influence on purchase decisions	Limited	High
Source of social influence	Experts and close friends	Well-known and influential people, friends

Conclusions and future directions of research

In conclusion, we can say that for people who work in marketing it is very important to be able to segment consumers in generations, in groups of people who lived similar experiences and have similar buying behaviour. Also, dividing people in generations is very useful for sustaining communication with clients, both when planning marketing campaigns, and in case of effective, interpersonal communication. Besides these aspects, determination of music stars, movie stars or legends with whom people of a certain generation identify can be an efficient means of dialogue with the representatives of these generations.

Discussing future directions for research, we think that topics such as the influence of buying behaviour of Generation Z on consumption in the 2020s, as well as the highlight of the significant differences between the natives of Generation Y and those belonging to Generation Zoomers in terms of marketing strategies in retail can be addressed.

Abstract

One of the most currently important objectives of the Eurasian Economic Union integration is to develop the scientifically founded procedures for harmonization of national legal frameworks in point of the potential alliance partners. The building of a single information space and legal base concordance in the sphere of post-clearance customs control will provide the elimination of the barriers appeared as the consequences of economic insulation affected by the collapse of the Soviet Union. The harmonization of the post-clearance regulations based on unified information space will contribute an effective collaboration aimed at the enhancement of economic relations in the Post-Soviet space. The article presents the method of comparative analysis of national and the Eurasian Economic Union's legal and administrative law corpus related to the post-clearance regulations from the perspective of a single information space. The proposed method is based on the following grounds: international sources of legal framework, scope of the legal acts, usage patterns of the risk management, control terms, forms and conditions, inspection results, performers and subjects of post-clearance control. The method approval and evaluation was realized for recent participants (such as Armenia and Kyrgyzstan) and prospective allied members (such as the Republic of Tajikistan) of the Eurasian Economic Union. The research results are premised on the generalization and arrangement of changes in post-clearance customs control, which were in process upon the entering of the Russian Federation, the Republic of Kazakhstan and the Republic of Belarus into the Customs Union.

Keywords: single information space; customs regulations; administrative barriers; the Eurasian Economic Union.

Introduction

In the current conditions of globalization and international integration the world is more unified than ever else. Economic, political and cultural interaction between the different states enhances. Statistics show sustained expansion of international exchange of goods, services, production factors. Accordingly, the development of the cooperation rules as a process of administrative and legal groundwork for economic integration emerges full blown. It is commonly known that since September 1993 the Russian Federation, the Republic of Kazakhstan, the Republic of Belarus, the Kyrgyz Republic and the Republic of Tajikistan had been planning the establishment of the Customs Union before the Customs Code of the Customs Union became operational in the territory of three member-states (Russia, Kazakhstan, Belarus) on July 6, 2011 (Borodin, Strokov, 2015). Since the ratification of the customs relationship between three partners, the efficiency of the collaboration was confirmed by the received benefits for the economies of the Customs Union members and the intentions of former Soviet states to join this community (Bleikher, Trubnikova, 2014). The Eurasian Economic Union was enlarged via including Armenia and Kyrgyzstan January 1, 2015. Tajikistan claims to be a member of the Eurasian Economic Union over the next while.

However, there are difficulties in the harmonization of the integration regulations in the consequence of isolation of national legal and administrative frameworks for customs activities (Popa, Belu, Paraschiv, Marinoiu, 2015; Ageev, Ageeva, 2015). To solve this problem it is necessary to find "the pinch points" in the national legislation and to harmonize them in the accordance with the legal provisions of the Eurasian Economic Union. At the present stage, this approach is a common practice for many geopolitical and economic international alliances. A remarkable example of the barriers eliminating in administrative and regulatory framework harmonization is the European Union. Despite the challenges that are addressed to the European Union in the conditions of the development of regulatory functioning model for countries with different economies, politics and culture, at least eight states are on the way to joining the European Union (Ogrokhina, 2015). These processes indicate that at the present stage of the economic relations developing economies tend to integrate into large profitable cooperation than compete with each other alone. Therefore, it is relevant to search for the methods of legal frameworks harmonization taking into account economic, political and cultural distinguishing features of the partners.

Each branch of customs activities is complicated and specific. Consequently, to solve the problem of administrative and legal frameworks harmonization it is reasonable to apply the sectoral integration of techniques focused on the barriers identification according to the different branches of customs regulations (customs clearance, post-clearance control, tariff regulation, logistics, classification of good, statistics etc.) can be applied. The set of the techniques integrated by the customs branches will form the unified methodological administrative and legal framework based on the Kyoto Convention that provides the general principles of the harmonization process.

The purpose of the study is to develop the determination techniques for national administrative and regulatory barriers that hindered the Eurasian Economic Union's integration in the sphere of post-clearance control. The authors attempt to combine the analysis of both European and Eurasian integration experience within the framework of the Kyoto Convention.

Method and Research Design

In order to achieve the research objective it is necessary to complete consistently the following tasks. Primarily, it is required to evaluate the relevance of the post-clearance control system that is operated in the Eurasian Economic Union to the main provisions of the Kyoto Convention. Subsequently the authors attempt to consider and classify Belarusian and Kazakhstani experience of the national legal renovation in the sphere of post-clearance control on the basis of academic and research sources related to the accession these republics to the Eurasian Economic Union. The following research stage is the development of a method for the identifying the administrative and legal specifics of national post-clearance regulation which prevent the integration into the Eurasian Economic Union. The final research stage suggests testing the method on the ground of the regulatory framework of Kyrgyzstan as the recent participant and Tajikistan as the main potential member of the Eurasian Economic Union.

Teoretical framewoks and legal sources

The international exchange of goods and services increases. Expanding goods traffic imposes additional obligations connected with the homeland security observation on national customs authorities. In that context customs control becomes increasingly important in the field of customs legislation enforcement and state budget replenishment by means of customs payments (Awad, Gore, Hou, Thomson, Weidlich, 2012; Butorina, 2014). One of the prospective directions of customs compliance modernization is the development of post-clearance control that provides simplification and expedition of customs procedures due to the risk-management, the selectivity and the building of a single information space (Bukhsh, Weigand, 2013; Urciuoli, Hintsa, Ahokas, 2013).

A separate chapter of the Revised Kyoto Convention as the main international act of the simplification and harmonization of customs procedures is devoted to customs control based on audit

and system of risk-management (Revised Kyoto Convention, 1999). Customs post-clearance control provides a means of the efficient use of customs services resources, customs compliance, the establishment of favorable conditions for international economic activities.

Currently the post-clearance control system of the Eurasian Economic Union is in transitive state. On the one hand, renouncing the customs inspections and all-inclusive customs control places it in close quarters with Kyoto principles. On the other hand, the substandard interdepartmental interaction hinders the implementation of risk-management and audit methods. International source of the regulatory framework and methodology of administrative regulation in the sphere of post-clearance control in the Eurasian Economic Union is the Kyoto Convention.

Customs post-clearance control is carried out in the Member States on the basis of the Customs Code of the Customs Union and national legislation. Since the entry into force of the Customs Code of the Customs Union, the Member States use the above-mentioned document to the post-clearance control. However, in addition to the Customs Code of the Customs Union, a Member State has the right to use national regulations that governed before joining the Customs Union and which do not contradict the Customs Code of the Customs Union. Therefore, the compositions of regulatory legal acts for each Member State are unique and not unified.

In the Russian Federation, customs authorities realize post-clearance control guided by the following legal acts:

- The Federal Customs Regulation Act of the Russian Federation, Section 3, Chapter 19, which is dedicated to customs control as a whole, and post-clearance control.

- Order of the Russian Federal Customs Service “About the confirmation of the Development Concept of post-clearance customs control”. This concept defines the goals, objectives, as well as the direction of the effective mechanism of customs post-clearance control in the present conditions until 2016.

- Order of the Russian Federal Customs Service “About the confirmation of the model regulations in the area of post-clearance customs control” which directly regulates the activities of customs authorities in the field of customs post-clearance control as well as allocates responsibilities of departments.

- The Constitution of the Russian Federation. Realization of the customs post-clearance control should be based on the principles of the Constitution.

- The Federal Accounting Act.

Regulatory support of customs post-clearance control in the Republic of Kazakhstan includes the following regulations:

- The Customs Regulation Code of the Republic of Kazakhstan. Section 3, Chapter 20 is devoted to the customs control. The Customs Regulation Code does not become invalid due to the entry into force of the Customs Code of the Customs Union. It is constantly updated and regulates relations in the field of customs at the national level, without contradicting the Customs Code of the Customs Union. The Customs Regulation Code contains complete information on the customs post-clearance control: the goals, objectives, methods and tools for implementation.

- The Conception of the reducing the stress from the customs clearance stage to the post-clearance stage of compliance in the Republic of Kazakhstan for 2013-2015. The Concept establishes the goals, objectives, as well as the direction of the effective operation of the customs post-clearance control until 2015. The concept also explains a mechanism of emphasis shift on the post-clearance control.

- The Accounting and financial statements Act of the Republic of Kazakhstan.

- As for the Republic of Belarus, the legal support of customs post-clearance control, in addition to the Customs Code of the Customs Union, is complemented by two acts:

- The Customs Regulation Act of the Republic of Belarus. Section 3, Chapter 17 of the Act includes statements about customs control in general. Enactment 120 includes objects, principles of customs control. Enactment №136 regulates the conduct of cameral customs inspection. It is important that the Customs Regulation Act does not regulate the realization of the on-site customs inspection.

- The Accounting and financial statements Act of the Republic of Belarus.

Guided by the results of the study of the above legal acts, we can conclude that methods, principles, forms and content of the customs post-clearance control in the member states of the Customs Union are uniform, while holding accounting and reporting is unique for each state.

In the member states of the Customs Union the structure of the customs authorities, which are responsible for the post-clearance control, is specific for each country. Consequently, subjects of customs post-clearance control are different.

Thus, in the Russian Federation, at the level of the Federal Customs Service, the subject of customs post-clearance control is the Head Department of the post-clearance control. In the Republic of Kazakhstan, at the level of the Customs Control Committee of the Finance Ministry, it is the Department of the post-clearance control. In the Republic of Belarus, at the level of the State Customs Committee, it is the Department of the realization of the post-clearance control. Activities of all these Departments are aimed at similar purposes (detection, prevention, suppression of administrative offenses by means of customs post-clearance control). The main challenges facing these offices have the same strategic functions. These functions include coordinating and monitoring the activities of departments of customs post-clearance control involved in the development of normative legal acts in the direction of activity, assess the effectiveness of the customs control (Volpe Martincus, Carballo, Graziano, 2015).

Subjects of post-clearance control (downward in the hierarchy of customs authorities of each of the member states of the Customs Union) are departments and special organizations performing tactical and operational tasks. Responsibilities of these departments are very similar. Among them we can mention customs post-clearance control, the identification of non-compliance with customs legislation, the use of risk management system.

Despite the difference in the structure of the customs authorities of the member states of the Customs Union, in terms of the functional approach, the subjects of customs post-clearance control in the three countries have common goals, objectives and functions. The risk management system, used in the three countries to the post-clearance control, is presented in the form of a model to comprehensively assess the possible risks through risk profiles, which are available in a single information field.

Checking residents in the member states of the Customs Union are persons connected with transporting goods, including carrying out foreign economic activity, as well as persons belonging to the customs infrastructure (customs representatives, owners of temporary storage warehouses). The two forms of customs post-clearance control are customs inspections - cameral inspection and on-site inspection (Borodin, Strokov, 2015; Ma, Ding, Lin, Hou, 2014). The results of the customs post-clearance control are presented in the form of acts of cameral or on-site inspection. Terms of the post-clearance customs control are common for the member states of the Customs Union. The cameral customs inspection is perpetual; the duration of the on-site inspection shall not exceed two months, but may be extended by one month.

The analysis of legal sources leads to the conclusion that in the member states of the Customs Union the national legal framework of the post-clearance control is preserved besides the Customs Code of the Customs Union. In the Republic of Kazakhstan the National Customs Code is valid and is constantly updated. Laws related to financial statements, on fundamental points (objectives, scope, the scope of the law, the objects of accounting and its organization) are similar; however, there are provisions specific to the state. For instance, monetary value account of the objects and the clearance of primary accounting documents, the form and content of accounting registers are individual in each state of the Customs Union. Among the specific points in the Accounting Act, we should also mention the national accounting standards, which are developed on the basis of international standards (IFRS -International Financial Reporting Standard, IAS - International Accounting Standards). Member states of the Customs Union provides almost unified legal framework for effective post-clearance customs control.

In the early stages of the Customs Union integration, there were some difficulties in carrying out post-clearance customs control. First, there was no uniform approach to its implementation. Secondly, there were different forms, methods and tools of control. However, the situation could not be called critical due to the fact that the basis of legislation to hold post-clearance control was the principles of Kyoto Convention. Nowadays, the legal gaps in the implementation of customs post-clearance control in the member states of the Customs Union are overcome. Clear evidence of this is the latest version of national legal acts regulating the relations in this area. Today post-clearance control in the three countries held uniformly in terms of forms, methods and tools for its implementation.

Technique to overcome legal and regulatory gaps in customs administration

Technique to overcome legal and regulatory gaps in customs administration at the introduction of the integration in the Eurasian Economic Union suggests the following stages:

1) To study the regulatory legal sources governing the specific area of customs administration in the community integration;

2) To consider regulatory legal framework regulating the issues in the state, join the community;

3) Identify the fundamental aspects and principles for the implementation of specific activities within the community integration, and in the state, which will join the community;

4) Investigate tools, mechanisms, methods of implementation of the activity of the two actors;

5) Expand the legal sources of international character, which is based on the normative legal framework governing the integration issue in the Customs Union, on the one hand, in the state, to join it, on the other hand. If the legal framework of each actor is based on uniform international sources, degree of commonality legislation could be considered acceptable;

6) Carry out a general comparative analysis of normative legal sources, tools, methods and mechanisms for the implementation of the activity;

7) Identify the differences in the implementation of activities and their impact on the degree of unification;

8) Develop recommendations for overcoming regulatory legal gaps.

Testing of methods on the regulatory framework in Kyrgyzstan and Tajikistan

The recent member state of the Eurasian Economic Union is the Republic of Kyrgyzstan (Umurzakov, Tyulyundieva, 2013). The date of accession was 1 January 2015. The Republic of Tajikistan is the strongest challenger to join the Eurasian Economic Union (Aslamov, 2015). Let try the recommended method of overcoming regulatory legal gaps on the example of countries joining the Customs Union. Since the legal framework governing the activities of this trend has already been given, let us consider a similar base in Kyrgyzstan and Tajikistan.

Regulatory support activities in the field of post-clearance control in the Kyrgyz Republic include:

- Customs Code of the Kyrgyz Republic.
- Post-clearance customs control instruction.
- Customs inspectors' responsibility regulation in the area of customs formalities and control.
- The International Convention on the Simplification and Harmonization of Customs procedures (Kyoto Convention).

Regulatory support activities in the field of post-clearance control in the Republic of Tajikistan include:

- Customs Code of the Republic of Tajikistan.
- Customs audit as a form of customs control Regulation Act of the Republic of Tajikistan.
- The Republic of Tajikistan Ratification of an accession to the International Convention on the Simplification and Harmonization of Customs procedures (Kyoto Convention).
- Act of the Republic of Tajikistan "About the administrative inspection of business entities".
- Operational-Investigative Activity Act of the Republic of Tajikistan.

Following the designed algorithm we will make a comparison for several reasons to develop a better comparison of the customs authorities in the field of customs post-clearance control and organize the data obtained in the course of analysis.

The legislative framework governing the activities of customs authorities in carrying out post-clearance control was the first comparison base. The criterion was chosen as the basis for comparison of the legal framework with the Customs Union is the legal framework of the Republic of Kyrgyzstan and Tajikistan, since the presence of specific regulations (regulations, which indicates the existence of specific areas of administration, firstly, and, secondly, on the basis of these acts performed all subsequent analysis).

Using the Risk Management System in the post-clearance control was the second comparison base (see point 1 in Table 1). This criterion was chosen as the basis for establishing the fact of the Risk Management System action proposed by the Kyoto Convention, as evidence of a uniform international framework for the implementation of such activities. Implementation of the Risk management under the post-clearance customs control is in full extent in Kyrgyzstan and Tajikistan.

Forms of customs post-clearance control (point 2 in Table 1) was the third aspect. The criterion was chosen as the basis for comparing the degree of unification of methods and tools for implementation of customs post-clearance control. Customs control with the use of audit methods was used in the

Kyrgyz Republic before joining the Eurasian Customs Union. In the Republic of Tajikistan forms of the post-clearance customs control are the same as in Customs Union members: customs cameral and on-site inspections.

Table 1: Comparative analysis of the particular characteristics of customs post-clearance control in the Customs Union members, the Kyrgyz Republic and the Republic of Tajikistan

	Customs post-clearance control in states of Eurasian region		
	Customs Union members	***Customs Union members***	***Customs Union members***
Implementation of the risk management	To the full extent	To the full extent	To the full extent
Forms of the post-clearance customs control	Customs cameral and on-site inspections	The use of audit methods	Customs cameral and on-site inspections
Terms of the post-clearance customs control	Cameral inspection is not limited in time. On-site inspection term should not exceed two monthes but it may be prolongated for one month	Post-clearance control term should not exceed 30 working days	Cameral inspection is not limited in time. On-site inspection term should not exceed 30 consecutive days but this term may be prolonged for 30 consecutive days

The base performance of customs post-clearance control and the result of the forms of customs post-clearance control were considered for comparison purposes directly into the documentation of the implementation of post-clearance control. In the Customs Union member-states cameral customs inspection may be provided without special Act and the inspection decision is necessary for the on-site customs inspection. In the Kyrgyz Republic document to follow customs control is necessary. In the Republic of Tajikistan documents to follow cameral and on-site customs inspections are necessary.

In the Kyrgyz Republic the statement of post-clearance control is based on the document which follows customs control. In the Republic of Tajikistan results are documented in the forms of Cameral inspection Act and On-site inspection Act.

Terms of the post-clearance control (point 3 in Table 1) and the audited entity were chosen for comparison of formalities to be followed in the countries under consideration. In the Kyrgyz Republic post-clearance control term should not exceed 30 working days. In the Republic of Tajikistan cameral inspection is not limited in time. On-site inspection term should not exceed 30 consecutive days but this term may be prolonged for 30 consecutive days.

In the Kyrgyz Republic post-clearance control subject is anyone who has obtained the right to use the special simplify customs formalities or anyone who is concerned with the customs infrastructure. In the Republic of Tajikistan post-clearance control subject is anyone who provides international trade activities or who is connected with the goods transported across the customs border or anyone who is concerned with the customs infrastructure (customs brokers, owners of temporary storage warehouses etc.). In the Kyrgyz Republic post-clearance control performer is Post-clearance customs control and

Risk management Department. In the Republic of Tajikistan post-clearance control performer is Customs control and inspection department.

Conclusion

According to the research results presented via the comparative Table, the main principles, forms and methods of the post-clearance customs control in the Eurasian Economic Union and in the potential members of the Union are corresponded. However, the legal and theoretical frameworks of the post-clearance control are largely unified with the Customs Union standards in the Republic of Tajikistan than in the Kyrgyz Republic. Pointed changes in the Kyrgyz national customs legal framework will enhance the degree of commonality of the Customs Union members the in the field of post-clearance control. Russian Customs Service actively assists to Kyrgyz customs agencies with the movement into the Customs Union operation. Thus, the suggested analytical technique allows to inquire into a particular direction of the customs management from different points of view and to develop the recommendations for the building of a single information space and for eliminating the administrative barriers and legal dissimilarities in the sphere of the economic and customs Eurasian integration.

Abstract:

This article analyzes the problem of taxation as a tool for social responsibility, the extent to which taxes can be an instrument of economic policy as a form of social interaction between the state, legal entities and individuals, on the example of a consolidated group of taxpayers. The article gives the concept and discusses the features of the consolidated tax regime in Russia and the main requirements for group of taxpayers. This article discusses the concept of socially responsible taxes, their role in the functioning of the state. This article also seeks to develop mechanisms of social responsibility of the consolidated groups of taxpayers, based on foreign experience.
Keywords: Consolidated group of taxpayers, tax, social responsibility, ethics

1. Introduction

One of the oldest financial categories is a tax. The emergence of the taxes associated with the division of society into social groups and the emergence of the state. Social and economic entity, as well as the functions and role of the taxes are determined by economic and political features of the society, the nature of the state and its tasks. Mandatory payments to the state had different names, and they often changed title depending on the changing economic and social conditions. For example in Germany, taxes were seen as assistance to the state in France as forced payment, and in the UK in the context of debt. In Russia a long time state taxes called prostitution, i.e. forced payment.

When the state imposes taxes, it may have not only fiscal objectives, but may prosecute any other tasks. The state cannot change core properties of tax, nevertheless it can construct elements tax in the way that can solve a particular economic or social problem. For example, using progressive income taxation, the state can try to narrow economic disparities. Or establishing equal income taxation, the state can save differentiation in incomes of the population.

1.1. The concept of consolidatedgroup of taxpayers

Funding is a major factor in the quality and degree of various public institutions such as the economy, housing, education, health, social support, protection of the environment etc. In Russia, these institutions are formed mainly due to the federal budget. One of the main sources of the federal budget is the value-added tax (VAT). The conditions when economic agents and population do the tax payments timely is solved more effectively in government. This factor explains the responsibility and tax culture of the population in developed countries while paying taxes. They see real results of state activity and state budget expenditures. At the same time in these countries there are also some tax-related issues that need to be addressed. For example, experience of states with different tax preferences. One form of such preferences is consolidated group of taxpayers (CGT).

In modern taxation there are multiple types of interaction between groups of organizations and tax system:

- tax law recognizes the relationship (legal, organizational and economic) between members of the consolidated group. There are negative and positive aspects of this recognition. A negative aspect is expressed in developing of transfer pricing as well as other forms of taxes avoiding that are undertaken within the framework of the group. The positive aspect is a total or partial exemption from taxation of business transactions between interdependent companies and more transparent administration.
- mechanism of consolidated taxation.

It should be noted that now the first type of interaction is almost non-existent. The most common is the second type (Bannova, 2014). World trends isdevelopment of institutes in taxation that gaining the third type, i.e. the introduction of consolidated taxation. Currently, the mechanism of consolidated taxation introduced in 18 of the 30 member countries of the organization for economic cooperation and development (Austria, Australia, Germany, United Kingdom, Spain, Netherlands, Portugal, United States, etc.).The international trend shows an increasing number of countries adopting consolidation in recent years (table 1).

Table 1. Years of introduction of consolidation regimes

Year of introduction	Country
1917	United States
1940	Netherlands
1971	France
1977	Spain
1992	New Zealand
2002	Japan
2002	Australia
2004	Italy
2010	South Korea

Source: (Ting, 2012)

Introduction to Russian tax practice a possibility to create a consolidated group of taxpayers (CGT) is one of the most important changes in the tax laws in recent years. The important role of the new institute for the tax system is determined by the proportion in corporate profit tax's proceeds paid by the participants of the CGTs to total tax proceeds of the federal and regional budgets in Russian Federation (Bannova, 2015).

Consolidated group of taxpayers is an association of corporate profit tax (CPT) payers on the basis of a contract for the purpose of calculation and payment of CPT tax in accordance with the total financial result of their economic activities. Such association is voluntary. Members of this group elect a responsible party who performs the calculation and payment of tax (advance payments). CGT is created only by Russian organizations provided that one organization is involved (directly or indirectly) in the capital of other organizations and share in the capital is not less than 90% (Aktaev, 2015). Tax consolidation involves the synthesis of commercial and financial performance of the group as a single economic entity.

To the participants of the CGT have to meet the following requirements:

- the organization should not be in the process of reorganization or liquidation;
- at least RUB 10 billion in total profits tax, VAT, excise tax, and MRET paid during the year preceding the year of registration of a group taxpayer;
- at least RUB 100 billion in sales proceeds and other income;
- total cost of assets of at least RUB 300 billion;
- the amount of net assets should exceed the amount of the authorized capital;
- the entity is not in the process of reorganisation/liquidation and is not subject to bankruptcy proceedings.

Advantages of introducing the consolidated groups of taxpayers:
1) CGT make possible to use of consolidated financial statements for profit tax. Payment of corporate profit taxis based on the financial results on a consolidated group of taxpayers,which decrease the possibility of using schemes on tax avoiding(Dyrina, 2015).
For the state disappears the need to implement control of transfer prices between interdependent organizations;
2) CGT make possible to reducethe negative consequences associated with the transferring of the tax base between the regions in Russian Federation.
Distribution of CPT payments by taxpayers in consolidated group is made on the rules used for distribution of tax proceeds of separate companies units, which are not legal persons. Namely, the corporate profit tax is paid in different regions according to the arithmetic mean of the consolidated group's participants shares in the total cost of fixed assets;
3) In CGT is possible to combinethe various procedures of tax administration in relation to the participants of the consolidated group of taxpayers. Costs on tax administration are reducedby transcribing the main responsibilities for the calculation and payment of CPT for one person-responsible party in CGT. This responsible partypays as well penalties and fines, as well as submits to the tax authority the relevant tax return;
4) CGT creates preferences for interdependent organizations-participants of the consolidated group of taxpayers, in terms of ability to summarize the gains and losses of the various actors in this group when calculating corporate profit tax;
5) Tax liabilities consolidation of integrated structures will contribute to the harmonization of the tax system;
6) Consolidated taxation in a federal state will reduce tax competition of regions through preferential rates for corporate profit tax;
7) CGT will stimulate the development of integrated structures, which contributes to the competitiveness of interrelated producers on the domestic and international markets.
According to expert's opinion, many countries recently have reached a kind of limit for taxation, not only in economic, but also in social-practice sense. In this situation, a further increase in taxation is fraught with qualitative changes in the economic structure of society. This circumstance explains why the number of states considering the introduction of a fiscal consolidation, is growing steadily (table 1). Therefore, in the long term, a wide dissemination of group taxation, as well as harmonization of group taxation conditions in different states at the international level is expected (Agundez-Garcia, 2006; Ting, 2013).

2. Tax as a social and economic tool

Question to what extent taxes may be an instrument of economic policy as a form of social interaction between the state, legal entities and natural persons, as well as the effectiveness of their use has attracted the attention of scientists from different countries and different areas of science(Khaperskaya, 2015; Chistyakova, 2015; Rumina, 2015). List of services provided by the state, for both personal and collective consumption quite diverse and distributed it to different spheres of society.

The relevance of research about tax's social function of taxes because of need to study the impact of taxation on the processes alignment of social and economic differences in income as business entities and the general public. The need for studies of taxes and their effect on the processes in modern society because of a limited number of taxpayers and taxable base of existing tax rates do not provide significant revenues. The economic instruments for companies build relationships with society.For example, the phenomenon of socially responsible investing in most western countries. A number of investment funds choosing an investment pays great attention to responsible behavior, apart from it to socially responsible investing. Also for socially responsible market participants easier access to credit and placement of securities. In Russia the spread policy of corporate responsibility is discouraged in any way (Cherepanova, 2013; Fedenkova, 2015, Kibanov,2010).

Nevertheless, the manifestation of social responsibility, which the constantly do is definitely perceived as a government by society, the business community and power. Although the absence of

such kind of policy is not a disadvantage yet. And it does not lead to negative consequences for the reputation and performance of the company. Consolidated group of taxpayers have favorable terms in the taxation system. Accordingly it is necessary to develop incentive mechanisms to enterprises of CGT to send a portion of the proceeds, to the needs of society.

In this moment, the efficiency of the stimulating functions of the state (the state in this context should be considered as the basis of business social responsibility) clearly does not match to the current phase of social sphere and economy development. There is a definite separation of the legislative and executive powers activities from the real needs of society in the current conditions. To correct the situation, including the development of ethics and social responsibility of business, many regulations require changing and additions. In particular, the tax code of the Russian Federation should be changed. In developed countries in order to improve the competitiveness of businesses, as well as his participation in various social projects the state applies tax incentives (Chistyakova, 2015; Dolgih, 2015).

In Canada, for example, is provided incentives to stimulate R&D sphere. Special benefits exist for the encouragement of agriculture and fisheries development. One of them is to attract children of farmers to work in agriculture. After the death of his parents in the form of farm property or a share in a family farm partnership goes to children without needing a lifetime of paying tax on the increase in the market value of the assets. Its payment delayed until heirs will themselves have any property, except over inherited (Bannova, 2015). Another benefit is the granting of rights to average income over a five-year period in order to protect farmers and fishermen from sharp fluctuations in incomes, which are inherent for these branches of activity. The third benefits is related to the method of calculating income for the year, decrease or increase the amount remaining after paying taxes.

3. Conclusions

To summarize, we can say that the social responsibility of business may have different manifestations: creating jobs, improving working conditions, occupational safety and health, special measures for the protection of the environment, active participation in the local community, charity, etc. But all of these manifestations are possible only in the presence of competitive business in the country. Therefore, the main task of all parties of social partnership business, society and the state is to establish conditions and direct improvement of the competitiveness for domestic enterprise. Despite the increasing role of global development strategy, priorities in relations between corporations and society still depend on political, cultural and institutional environment in which the company operates.

Margarita P. Zavyalova, National Research Tomsk State University, Tomsk, Russian Federation, zzavyaloff@yandex.ru

Abstract

The development of curricular and organizational features of master's programs and especially the choice of educational technologies, learning methods are among the university's responsibilities. The paper considers an interdisciplinary project as a necessary element of the engineering education and a condition of obtaining professional competencies. The paper reports on the investigation of obstacles that an interdisciplinary project meets in practice and suggests the principles and evaluation criteria that might help to overcame the obstacles. The Master's program "Information technologies in advertising and public relations" that is provided by National Research Tomsk Polytechnic University (Russia) was chosen as a base for a design experiment. Further research should validate these criteria for evaluation an interdisciplinary project and create the detailed procedure of assessment with measurable indicators.

Keywords: interdisciplinarity; engineering education; interdisciplinary project; evaluation criteria; design experiment.

Introduction

The prediction of the development perspectives of engineering education is guided by the complementary principle of the natural-scientific, social-scientific methodological tradition and humanitarian methods of cognition.

The modern approach to engineering education assumes that a prospective specialist forms not only knowledge and skills, but also special competencies directed at the capability to apply them in practice when creating a new competitive product. As a result, a new quality of engineering education is attained via providing a group of competencies, including fundamental and technical knowledge, analytical skills and problem solving abilities using an interdisciplinary approach, mastery in the methods of project management.

Introduction of the interdisciplinary approach allows embracing a greater scope of the cognitive field, provides multidimensional vision of professional tasks, which comprises the peculiarity of the modern criterion of the engineering culture (Augsburg & Henry, 2009; Frodeman, Klein, & Mitcham, 2010; Collin, 2009). Interdisciplinary projects involve different disciplines within engineering educational program. In other words, interdisciplinary project needs "faculty from different areas of campus work together toward the development of project" and students' team with different majors (Reid, Montenery, & Hetrick, 2011; Yelamarthi, 2012). Although an interdisciplinary approach in engineering education accompanied by a growing body of publications, single papers have been devoted to the curricular design and to a special issue on the assessment of interdisciplinary research (Gouvea, Sawtelle, Geller, & Turpen, 2013; Spelt, Luning, van Boekel, & Mulder, 2015; Knight, Lattuca, Kimball, & Reason, 2013; Lélé & Norgaard, 2005; Scholz1 & Steiner, 2015). This paper contributes to research on principles of interdisciplinary research and evaluation criteria of an interdisciplinary project.
The purpose of the research is to reveal the principles of theme formulation of interdisciplinary projects and criteria of their subsequent assessment. The Master's program "Information technologies

in advertising and public relations" that is provided by National Research Tomsk Polytechnic University (Russia) has become the empirical basis of the research.

Methods

The principle of interdisciplinarity in the scientific cognition and in the pedagogical process has become a theoretical-methodological basis of the paper (Augsburg & Henry, 2009; Frodeman, Klein, & Mitcham, 2010; Collin, 2009; Kasavin, 2010).
Design experiment has been chosen as a research method (Collins, Joseph, & Bielaczyc, 2004).
The object of the research is a professional training of IT engineers (basing on the example of the Master's program "Information technologies in advertising and public relations").
The subject of the research is an interdisciplinary project as a structural element of the educational technologies of the higher technical educational institution.
The purpose of the experiment is to reveal the principles of theme formulation for interdisciplinary projects and criteria of their subsequent evaluation.
The collected data on the diagnostic stage of the experiment have shown that master students of years of study, the first and the second, require greater attention in formation of professional competencies, the developed methodology was approved in the experimental groups containing master's students: the first year of study – 17 people, the second year of study – 15 people.
The arrangement of the educational experiment has required setting the following tasks:

- To identify the possible ways of inculcation interdisciplinary projects in the educational process; to evaluate the attitude of the university staff and students towards the application of the interdisciplinary projects in the educational practice.
- To reveal the opportunities which are provided by the interdisciplinary project to enhance the quality of engineers' training.
- To highlight the basic problems of this technology application from the standpoint of the project participants.
- To reveal the possible disagreements among the participants of the project.

Throughout the experiment the following skills and abilities of students have been fixed:

- Information search skills.
- Need to search for the necessary information.
- Acquisition of the conceptually multidirectional information on the project problems, ability to interpret it.
- Ability to operationally report on the processed information to all participants of the project.
- Ability to comment the problem and suggest different solutions.

Results and Discussion

The design experiment is an implemental type of research activity, the main purpose of which is to check experimentally the methods of formation of professional competencies (basing on the example of the interdisciplinary project) of the future engineers in the field of information technologies in advertising and public relations.
The conducted experiment allowed to reveal the following challenges that participants have faced in the course of interdisciplinary project implementation:

- In the context of interdisciplinary projects there is a complexity of notions. Different disciplines use proper scientific languages which require substantial efforts to establish a dialogue and develop a mutual understanding.
- As participants have met only for the interdisciplinary project, they often have a limited understanding of the specific character of each other's disciplines. Particular difficulties arise for the representatives of social sciences, which methods and subjects are quite similar.
- In the context of the implemented project it is possible to note a definite "inequality" between natural science and social-humanitarian disciplines. At the initial stage of the experiment this fact impeded the determination of the main logic of the project and resources allocation.

The conducted experiment as well as the analysis of the literature (Knight, Lattuca, Kimball, & Reason, 2013; Lélé & Norgaard, 2005; Scholz1 & Steiner, 2015; Kasavin, 2010) allowed to define

the principles which are desirable to be adhered when formulating the themes of interdisciplinary projects:

- The proposed themes should have practical importance and should be focused on solving urgent problems that allows maintaining the interest of the project participants.
- The interdisciplinary project assumes students' right to choose the purpose, methods of conducting the research and ways of problem solving. Therefore, it is desirable not to mention the means of problem solution in formulation of the theme.
- The project problem formulated by the participants should correspond to the potential of disciplines included in the curriculum.
- In order to avoid the problem of reduction of the notion content to the language of the observer of another level, the project theme should be formulated so that the initial notion context retains. This is connected with the fact that notions can distort their own meaning when they are included into the context of the irrelevant for them field, where can be other notions that are similar in their meaning. In this case the interdisciplinary project transforms into an "innerdisciplinary" one, and the probability of obtaining a new cognitive product decreases.

D. The following evaluation criteria for implementing the interdisciplinary project have been formulated:

- Completeness of the project realization and a new knowledge creation (the degree of attainment of set goals and tasks);
- A level of mastering the designing procedures (the ability to find and formulate a problem, the capability to conduct a research, to formulate a goal, to reveal the problem solutions, etc.);
- Appeal to the personal experience, to the cases from professional practice, which illustrate the interdisciplinary problem;
- Identification of the factor (factors) in the different subject area, which enable to solve the set problem;
- Self-evaluation of the project participants (presence of the positive effects on an individual level);
- Presence of the participants' need in further development of their own project experience.

Conclusions

Interdisciplinary projects allow creating the conditions, which are practically correspond to the real engineering activity. As a result, students acquire the experience of complex problem solving in engineering designing along with the distribution of functions and responsibilities between the members of the team. However, the efficiency of the project-based methods is in many ways determined by the established themes and criteria of the subsequent assessment.

As long as the evaluation criteria of the results of academic activity of the students engaged in the interdisciplinary project remain insufficiently developed, they are supposed to be studied further for the purpose of systematization, based on different grounding and determination of the corresponding assessment procedures.

Methods of the Economy Competitiveness Ensuring (the Experience of Russia)

Vladimir Plotnikov, Saint-Petersburg State University of Economics, Saint-Petersburg, Russia; South-West State University, Kursk, Russia, plotnikov_2000@mail.ru
Andrey Prolubnikov, Saint-Petersburg State University of Economics, Saint-Petersburg, Russia, plotnikov2000@ya.ru

Abstract

The competitiveness of the national economy is determined by many factors. One is the availability and quality of electrical power. Therefore, the electric power industry in the world paid much attention. Reforms in the power sector are the tool for improving the competitiveness of the economy. The authors analyze the Russian experience of reforms in this sector. They give a comparison of Russia and other countries of the world on this issue. The article substantiates the conclusion about the necessity of development of a mixed (public-market) regulation in the electric power industry. This approach to regulation will ensure the improvement of national competitiveness.

Keywords: national economy; state economic policy; competitiveness of the economy; partnership between business and government.

1. Introduction

High competitiveness is one of the main objectives of management and public policy. The level, at which to set and achieve this goal, may be different. Business, as a rule, tends to the competitiveness of a particular product or brand. The government has more ambitious goals. It provides the country's competitiveness as a whole or its individual territories (such as the free economic zones).

The subject of the analysis of the authors is the economy's at the country level competitiveness. It is achieved through the use of instruments of state policy. The choice of these instruments and their combination significantly influenced by many factors. Therefore, methods to ensure the competitiveness of the economy must be flexible to use. Effective methods take into account the specificity of control object: country, region, sector. Therefore, its application is diverse and differentiated.

To give a concrete analysis, in the article we consider issue of governance the competitiveness of the economy by the example of the Russian power industry development. This industry is one of the backbone in the modern economy. Therefore, its reform and the efficiency has received considerable attention. Its success largely depends on the competitiveness of the economy.

2. Factors affecting the competitiveness of the economy

At the end of October 2015 the World Bank published the rating of "Doing Business". In this rating Russia has made quite an impressive leap up. It has improved its ranking by 11 positions. As a result, it now occupies the 51 place in the world. This result is slightly lower than planned (the President of the Russian Federation was set the task of the public authorities to enter the world top 50 in 2015). At the same time, this result indicates the success of the authorities' efforts to create favorable conditions for business.

One reason for the strengthening of Russia's position in the ranking of "Doing Business" is that the productive reforms have been implemented in Russia. Among these we highlight in the area of energy reform. Their importance is determined by the fact, that in the ranking "Doing Business" takes into account 10 indicators, among which, in addition to the time and money to create a new business, dealing with construction permits, registering property, getting credit, protecting investors' rights, tax regime of

international trade, enforcement contracts, bankruptcy procedures, is allocated access to the electricity infrastructure.

Consider the various reforms undertaken in the countries of the world, in terms of their impact on the country's position in this ranking. From 2006 to 2016 many (2499) different reforms have been carried out in the world. In some countries, reforms were carried out more intensively, and some – less. Russia is in the top 10 countries by number of reforms. Total 29 reforms have been carried out (see Table 1). By number of reforms in the power sector (Table 2) Russia leads the world. She shares the 1-2 places with the United Arab Emirates.

We believe that the attention of the drafters of the rating Doing Business in the power industry is a natural. The difficulties with the connection to electricity greatly affect the launch of new business projects. Currently, energy has a major impact on economic development and international competitiveness of countries. Government began to pay greater attention to these issues. This changes the conceptual framework for reform. Instead of instruments of regulation or direct state control of the government are increasingly guided by the principles of a competitive market. They believe that the market price signals and consumer preferences make it possible more effectively to balance supply and demand and to influence investment decisions in the energy sector.

Table 1: Number of reforms in the countries of the world from 2006 to 2016

Country	Total	Rank
Rwanda	43	1
Georgia	38	2
Macedonia	36	3
Belarus	32	4
Kazakhstan	31	5

The energy industry has traditionally been regarded as a natural monopoly. The high cost of its development and technical obstacles speak in favor of the provision of electricity services are not competing firms, and the only economic entity. This view began to change only recently. It is connected

with the study of the technological features of the electric power and the mechanisms of their display in a market economy.

The reforms carried out in the US, the UK, Chile and other countries have shown that natural monopolies can be stored in the electric power transmission and distribution links. At the same time the development of competition in the production and distribution of electricity is possible. For example, the American experts, analyzing a sample of 50 countries, concluded that competition in the electricity could lead to lower prices by an average of 13%, and in some countries – more than 30% (Mastepanov, 2010). For the Russian economy, this experience is very important. In Russia, high (in comparison with the developed countries of the world), inflation is one of the limiting factors of national competitiveness. Therefore, containment of electricity tariffs is an important task.

3. Effect of electric power to the competitiveness of the economy: the experience of Russia and other countries

The impact on energy prices (in particular – for electricity) is one of the most important factors of competitiveness. As noted in the report "World Energy Outlook 2013", the uneven starting conditions for competition in the world is largely determined by two factors (IEA, 2013). Firstly, it is large differences in regional energy prices. Second, regional differences in energy prices in the medium term will determine the level of competitiveness of industry and will be a decisive influence on the development strategy of company and investment decisions.

We note one more, specifically Russian, channel influence of electricity on national competitiveness. Russia differs sufficiently high level of energy intensity of GDP. It has been estimated (Mel'nik and Sadriyev A.R., 2010), the energy intensity of the Russian GDP higher than in developed countries is 2-3 times. In our view, such an assessment rather debatable. For example, it expressed the view that no more informative indicator of energy intensity of GDP, but the energy intensity of the Gross Added Value (Klimova and Litvak, 2012). Centre for Energy Efficiency Experts point to the need for separation of energy intensity to a number of technical and economic groups and assess their dynamics (Bashmakov and Myshak, 2012). There are also other opinions on the matter.

Despite the variety of estimates, the majority of experts in Russia agrees with the need to reduce specific energy consumption. High power consumption has a negative impact on the competitiveness of the national economy. In this regard, urgent is the task set by the decree of the President of the Russian Federation dated July 8, 2008 № 889 "On some measures to improve the energy and environmental efficiency of the Russian economy", to reduce by 2020 the GDP energy intensity by at least 40% 2007 base year.

In many ways, energy efficiency and increase the competitiveness of economic entities will be associated with an increase in the availability of electricity, increased competition in the electricity markets. World experience shows that the competitive sale of energy allows consumers to choose suppliers on the basis of price and quality. Such a choice among consumers appears gradually, as at first it is a competition only in the sphere of mass wholesale or large industrial consumers and distribution network. Over time, this process gradually involved and smaller customers. Ultimately, the choice of electricity provider appears each client.

Gradualism should be followed in the implementation of energy reforms. For example, in the UK competition in electricity sales was introduced in three steps: large customers a choice was given in 1990, the average – in 1994, and household customers – in 1998. As a result, by 2000 almost 81% of large customers and 38% of households at least once changed their energy supplier (Mastepanov, 2010). We do not expect that the activities of electricity market deregulation must inevitably lead to lower prices. The belief that the lack of free competition (or rather – not enough free competition) always leads to high prices do not correspond to reality. It is determined by the vulgar understanding of microeconomic theory partition, which deals with the behavior of monopolies. This opinion does not take account of the fact that today's markets are under strong state control.

Due to the state regulation of energy monopolies, the level of energy prices may differ from the equilibrium (inherent in a hypothetical model of free market competition). For example, in Argentina (Ostrovsky, 2010), the abolition of regulated prices for natural gas, and measures to promote competition in 1993-1995 led to an increase in sales prices by 15%. Despite this, the natural gas consumption in the country from 1992 to 1997 increased by 50%, which was due to non-price factors, the inflow of capital into the industry significant, increase its attractiveness, increasing physical availability of natural gas for consumers.

Reform of the legal bases of functioning of the electricity sector in order to reduce costs and improve the quality of infrastructure services is becoming a global trend. It is observed in Russia, too. Comparative analysis shows that the program of reforms in different countries as a whole are conducted on the same areas of privatization, structural reforms and the opening of access to the network infrastructure.

Consider the experience of reforms in the Russian power industry (see: http://www.ra-national.ru/sites/default/files/other/55.pdf). In the post-Soviet period it is a natural monopoly has been created in Russia (vertically integrated) "UES of Russia". But by July 1, 2008, it ceased to exist due to the separation of a number of legally independent organizations in the field of generation. Electricity infrastructure remained under a single management. Branch was divided into natural monopolies (transmission, distribution of electricity) and competitive (production and marketing) activities. The market has been formed on two levels: the wholesale and retail market.

The legal framework of the transformation of the Russian electric power industry has created a Government Resolution dated July 11, 2001 № 526 "On the reform of the Russian power." The need for reform has been caused by a deficiency of investment, decline in reliability of electricity supply, increase of imbalances of market regulation, and others. As a result of the reform of the sector only for 2005-2012 in the electricity had attracted about 4.6 trillion rubles of investments. More competitive electricity market has been established. Despite the problems in modern Russian power, some Russian experts believe that the whole reform to be successful (Knyaginin and Lipetskaya, 2014).

There is an opposite point of view. According to Barinov (2013), "the years of reform there was a deterioration of economic indicators of the industry. Since 1991, more than 1.5 times increased relative power losses in networks of its vehicles in more than 1.5 times increased the specific number of staff in the industry. Significantly increased the tariffs for electric energy, the share of obsolete power equipment in power plants and power grids".

Such estimates require explanation polarization. Otherwise it is difficult to choose a vector of further development of the power industry and the economy as a whole. There may be an error committed in the implementation of modernization policies in the future. What accounts for such a controversial? In our opinion, they are caused by different base suitable for comparative analysis.

Russia's economy, considered as a part of the economy of the USSR during the period of liberal market reform seriously degraded (Åslund, 1995; EBRD, 1998; Malykh et al., 2015; OECD, 1997 and other). This process also affected the electricity industry. The negative impact is felt on both sides. First, like other sectors of the economy, energy, experienced investment contraction, lack of liquidity, reducing the rate of renewal of fixed assets, the lack of qualified personnel, and others. Secondly, as the infrastructure sector, power industry has focused on itself, many problems of other sectors of the real sector of the economy (late payments, technological constraints, inflationary pressures, and others). In this context, the choice as a "starting point" of various periods of development of electric power industry will inevitably lead to different estimates of its current state, as well as to differences in the assessment of the impact of reforms.

4. Prospects for improving the competitiveness of the economy through reforms in the power sector

According to experts of the St. Petersburg Polytechnic University, the development of the Russian energy sector will be associated with the transition to energy systems of the new generation (Knyaginin and

Lipetskaya, 2014). This transition will be carried out in four main areas: the establishment of power grid management systems ("smart" network or Smart Grid); development of long-range electric vehicle technology (which is especially important for Russia, taking into account the geographical factor and resource plans of Siberia, the Far North and the Far East); development of power storage technologies in the energy system; the development of distributed generation.

There is need for an intensification of technological development (Barinov, 2013). Electric power modernization program requires an expansion of the use of innovative technologies in the generation and transmission systems and distribution of electricity; multi-level harmonization and development of components of the unified electric grid; creating a holistic management system development and operation of electric power.

It is clear that, despite some differences, the vision areas of industry transformation is largely common. To solve these major problems due to a public resource is impossible. (Not coincidentally, in this regard, we believe the institutionalization of the federal legislation in 2016 of public-private partnership, which is in many respects, as shown by previous studies (Babkin et al., 2015; Plotnikov and Vertakova, 2015), due to the implementation of energy infrastructure projects.) Therefore, further necessary development of the sector within the framework of liberalized model. That allows it to combine the rational government regulation of the power industry, including the maintenance of a fair price, with a private initiative aimed at cost-effective solution of organizational, technical, legal and other industries functioning problems.

Of course, in the power industry, the choice of policy purely liberal reforms, conflict can arise between the principles of economic efficiency and social justice, which is the free market forces are unable to resolve. This requires the creation of non-market mechanisms coordinating the interests of producers and consumers of energy. This mechanism should be based on the activities of the public administration. And it is important to comply with the restriction: created a mechanism should not weaken incentives to economic activity. Only in this way we are able to provide a high level of competitiveness of the Russian economy.

To achieve these goals and tasks arising from them, in the immediate disposal of the authorities is the legitimate right of coercion that distinguishes them from other actors of the market economy. However, any form of government intervention, and creating the risk of adverse negative effects. In this regard, in the power formation of the specific mechanism of the Russian state-market regulation, which is a general trend in the construction of the Russian model of a mixed economy.

5. Conclusions

According to experts of the St. Petersburg Polytechnic University, the development of the Russian energy sector will be associated with the transition to energy systems of the new generation (Knyaginin and Lipetskaya, 2014). This transition will be carried out in four main areas: the establishment of power grid management systems ("smart" network or Smart Grid); development of long-range electric vehicle technology (which is especially important for Russia, taking into account the geographical factor and resource plans of Siberia, the Far North and the Far East); development of power storage technologies in the energy system; the development of distributed generation.

There is need for an intensification of technological development (Barinov, 2013). Electric power modernization program requires an expansion of the use of innovative technologies in the generation and transmission systems and distribution of electricity; multi-level harmonization and development of components of the unified electric grid; creating a holistic management system development and operation of electric power.

It is clear that, despite some differences, the vision areas of industry transformation is largely common. To solve these major problems due to a public resource is impossible. (Not coincidentally, in this regard, we believe the institutionalization of the federal legislation in 2016 of public-private partnership, which is in many respects, as shown by previous studies (Babkin et al., 2015; Plotnikov and Vertakova, 2015), due

to the implementation of energy infrastructure projects.) Therefore, further necessary development of the sector within the framework of liberalized model. That allows it to combine the rational government regulation of the power industry, including the maintenance of a fair price, with a private initiative aimed at cost-effective solution of organizational, technical, legal and other industries functioning problems.

Of course, in the power industry, the choice of policy purely liberal reforms, conflict can arise between the principles of economic efficiency and social justice, which is the free market forces are unable to resolve. This requires the creation of non-market mechanisms coordinating the interests of producers and consumers of energy. This mechanism should be based on the activities of the public administration. And it is important to comply with the restriction: created a mechanism should not weaken incentives to economic activity. Only in this way we are able to provide a high level of competitiveness of the Russian economy.

To achieve these goals and tasks arising from them, in the immediate disposal of the authorities is the legitimate right of coercion that distinguishes them from other actors of the market economy. However, any form of government intervention, and creating the risk of adverse negative effects. In this regard, in the power formation of the specific mechanism of the Russian state-market regulation, which is a general trend in the construction of the Russian model of a mixed economy.

Effective Management of Recreation Resources for Human Capital Increase

Tsibulnikova Margarita, Tomsk Polytechnic University, Tomsk, Russian, and E-mail: tsibulnikova2011@yandex.ru

Abstract

The region's level of social and economic development depends mostly on the quality of human capital, which in its turn is determined by the quality of life. Recreation is essential for people to restore their work capacity and plays an important social and economic role as it contributes to the labour productivity increase. Currently in Russia, and in Siberian Federal District in particular, tourism and recreation areas are being intensively developed through budget and non-budget financing. However, the majority of projects lack ecosystem services assessment, which might cause financial risks for project implementation, as well as conflicts with the inhabitants. The paper establishes that it is necessary to use a complex approach to the project development, which implies ecosystem services assessment via socioeconomic methods.

Key words: human capital, recreation, ecosystem services, economic assessment

Introduction

Economic productivity and efficiency primarily depend on the quality of human capital, most significantly, that of population in urban areas since it provides the basis for economic growth.

Quality of life in terms of sustainable development is determined by a number of indices, including that of economic development, which in its turn boosts growth of cities and industrial areas, where different services are provided, financial flows and taxes are generated, and household and local authority incomes are accumulated. As C.S. Antognelli and M. Vizzari (2016) noted, urban environment and social and communal infrastructure stipulate the quality of life in the area. The environmental parameters include the quality of dwelling, efficiency of house holding, and the anthropogenic load on the local environment.

The level of local economic and social development, as well as the quality of life, is stipulated by the municipal entities and their industrial, cultural, agricultural, financial, human, and recreation potential.

Intense urbanization causes the demand for high quality nature rest and comfortable recreation. Recreation industry is concerned with landscape conservation and is inconsistent with natural resources production. Intensively developing urban environment is becoming more and more aggressive and has negative impact on human physical and psychological health because of stress it causes. According to World Health Organization data (2014), the human health depends on a healthy environment (20%), while some experts believe that about 95% of impairments are caused by the environmental conditions.

Recreation is essential for people to restore their work capacity and plays an important social and economic role. Thus, nature rest increases labour productivity and efficient labour time. According to the research data, Sunday rest in the forests around the city accounts for a 3% increase in annual average labour productivity.

As M. Kh. Akhmatova and E. Kh. Khaniev showed, in terms of social significance of natural resources recreation, forest is more valuable than wood. The forests in Germany are estimated at 53 billion euros, while the cost of wood products is 17 billion euros, and forest water protecting capability per one ha is 2.8 times higher than the cost of wood. According to K. Kupert and H. Pabst (2013), who provided estimates of forest resources with the regard to their social functions (including water regulation, environmental recovery, and recreation), the cost of forest is 280 times higher than that of wood.

As David M. Edwards et al (2012) noted, intense urbanization stipulates natural resources recreation management based on interdisciplinary scientific approaches which imply the concept and principles of sustainable development and economic assessment of ecosystem services. M. Giergiczny et al (2015) supposed that development and implementation of natural resources recreation management system will allow reaching the compromise between social and economic development of recreation areas and landscape and biodiversity conservation. Natural resources recreation includes forest green zones around the cities, conservation areas, wild life reserves, and national parks.

Soldatov S. A. (2001) supposed that natural resources recreation accounts for social healthcare affect (increased labour capacity, decreased incidence of diseases and death rate), which in its turn becomes economic effect in other spheres since increased labour capacity leads to labour productivity growth, decreased incidence of diseases reduces healthcare costs, etc.

Kuskov A. S. (2005) pointed at important economic functions of recreation: boosting local economic development; expanding labour market as people are involved in recreation services, as well as in other industries which are connected with recreation; the impact on distribution of income and costs across the country, for the benefit of recreation areas.

As Kruzhalin V. I. et al (2011) pointed out, in terms of recreation management and local recreation resources, there are three major types of countries attractive for tourists:

1) countries with abundant and valuable recreation resources and well-developed recreation service and infrastructure (for example, Switzerland , Italy, Greece, Turkey, etc.);

2) countries with high recreation potential but poorly-developed service (for example, Russia, countries of South Caucuses, etc.);

3) countries with limited recreation potential but well-developed recreation service (for example, the majority of countries in North West Europe).

Results and discussion

According to World Economic Forum data (2014), in the global competitiveness rating, Russia in 2013 ranked 64th out of 130 countries. As for Sustainable Development index, Russia was at the bottom of the list (the index includes such parameters as efficiency of environmental law, environmental regulation, amount of carbon dioxide emissions, number of endangered species, etc.). However, Russia was ranked 37 in 2013 and 27 in 2011 in terms of valuable natural resources.

According to United Nations World Tourism Organization (UNWTO), Russia possesses a great tourism and recreation potential. In some regions of the country tourism and recreation industry is at the initial stage of its development. The RF can become attractive for tourists if there are special economic zones for tourism and recreation (SEZTR).

Since 2006, 14 tourism and recreation zones have been established in the territory of the RF. The aim of SEZTR is to boost economic development of leading regions and create the multiplier effect, which covers all connected industries, as well as human healthcare and quality of life. This can be reached through making tourism and health resort services available for Russian people, environment conservation, and preservation of natural and cultural values.

Today, the greatest intact ecosystem is located in Siberian Federal District (SFD). Siberia is famous for its nature recreation resources, cultural and historical sights, which are of local, regional, federal and even global value. For example, in the territory, there are objects of UNESCO world natural heritage (Golden Mountains of Altai, Lake Baikal, Ubsunur Hollow, etc.), which is particularly important because of growing interest in global ecotourism. The high recreation potential of SFDt is currently considered an economic development perspective.

SFD is located between Ural Federal District and Far Eastern Federal District. It is a land area of 5144953 km^2, which makes up 30% of total national area. The population at the beginning of 2014 was 19292740 people, with population density being 4.0 people per square kilometer. The highest population density is in big industrial cities such as Novosibirsk, Omsk, Krasnoyarsk. Over the period of 2003–2013, there has been natural population growth and life expectancy increase, with a 12% rise of disease incidence and 3% reduction of costs for healthcare.

In the course of our research, we have considered several tourist and recreation zones in operation located within SFD: the Gate of Baikal (Ikrutsk oblast), Baikal Harbour (the Republic of Buryatia), Altai Valley (the Republic of Altai), the Turquoise Katun (Altai Krai), as well as SEZTRs in Tashtagolsk area and Kemerovo oblast.

These zones were established due to the regional particularities. They are currently large-scale projects with intensive investment aimed at development of two recreation areas of global value – Altai and Baikal (this explains why these SFD units possess the status of SEZTR). Within these zones, there are particular regulations for economic activities, specially developed infrastructure, preferential treatment and incentives for management companies and other residents including those involved in recreation service (100% remission of property tax, 13.5 decrease in the income tax rate paid by companies and applied towards the local budget, etc.). There are also non-financial support (management, information, and consultation) and financial one provided within the long-term projects on local tourism development.

However, in the investment project calculations there is no information on local ecosystem services assessment and inhabitants' opinion on natural resources management. Without considering this aspect, there are significant risks of project implementation to be faced by the investors and the national government, which provides financial support for the projects. Moreover, there might be conflicts between the investors and local inhabitants. To implement the concept of sustainability into SEZTR development, it is necessary to make economic assessment of ecosystem services and then compile it with the investment assessment.

However, the economic mechanism of integrating economic interests and efficient natural resources management has been beyond the scope of attention and none of the following documents has considered this issue: the strategies for local and national development, the concepts of SEZTR and business plans of SEZTR development, national tourism regulations, preferential treatment regulations, regulations on mountain ski tourism development, etc.

Therefore, natural resources assessment needs well-developed methodology for ecosystem services assessment, as well as an efficient jurisdiction basis. We suppose that recreation potential and ecosystem capacity assessment make the first stage of land development in recreation purposes.

Recreation resources in demand stipulate recreation load on the environment. Resting people and their vehicles have a negative environmental impact. Intense anthropogenic load reduces the quality of recreation resources, leads to ecosystem degradation, loss of biodiversity and deterioration of living conditions for the inhabitants.

A. Montis et al (2016) noted that under the conditions described above it is necessary to develop recreation resources management based on the economic mechanisms. In the opinion of M. E. Mastrangelo and the coauthors (2016), natural resources and eco services assessment is necessary to develop an adequate economic policy and to make appropriate economic decisions. As M. De Salvo and G. Signorello (2015) suggested, integrated economic assessment of environment including non-market value of recreation services, will make the environment competitive in its struggle for existence and conservation. As A. Filyushkina et al noted, the economic assessment presents the value of ecosystem and biodiversity, as well as their inestimable contribution to public welfare, in terms of economy and politics. To ensure sustainable management, it is necessary to distribute natural resource rent and reinvest in natural resources conservation and further development. Rental income distribution is a key factor, which may help to solve many social problems and overcome environmental challenges. Natural resources assessment can contribute to efficient decision-making by the government and private sector, as well as to enhancement of jurisdiction.

The results of Tomsk recreation zones economic assessment (2011, 2015) made in the course of our research show that it is rather important to take into account environmental and social aspects when developing methodology for natural resources economic management. The total recreation area of Tomsk agglomeration includes 145 natural monuments, 217 monuments of architecture, 165 nature conservation areas, 163 historical monuments, 190 tourism companies. About 800 thousand people annually visit Tomsk oblast and the amount of tourism services increases. As an example, we made economic assessment of Timiryazevo pine forest ecosystem services. The forest performs recreation

and healthcare functions for Tomsk population (more than 600 thousand people). The forest microclimate and landscape are favorable for all season recreation.

We made economic assessment for the following ecosystem services:

- food potential;
- recreation and culture services;
- regulatory services.

The comparison of research data obtained in 2000 and 2012 shows that the quality of ecosystem services deteriorates upon improperly managed recreation activities, which leads to the decline in the area recreation potential, makes the area less attractive, and causes the decrease in the self-regeneration capacity of the environment (table 1).

Table 1. Data on social, environmental and economic assessment of recreation resources (Timiryazevo pine forest, Tomsk)

	2000	2012
Provisioning ecosystem services: real cost of wild berries and mushrooms, million dollars per year	2.8	2.7
Regulatory services (absorbing carbon dioxide), million dollars per year	3.4	3.4
Culture services (recreation services, aesthetic pleasure) in terms of willingness to pay, million dollars per year	3.8	16.9
Visiting forest for picking wild crop, %	54	19
Visiting forest for recreation purpose, %	8	51
Visiting forest for both picking wild crop and recreation, %	32	16
Percentage of people willing to pay for the area conservation	63	80
Willingness to pay (WTP) per capita per year, dollars	0.7	42

As it can be seen from the table, the amount of inhabitants visiting forest for the recreation purpose has increased by 6.4 times since 2000, while the amount of people visiting forest for picking wild crop has reduced by 3 times. One of the reasons for the wild crop failure is the increased anthropogenic load. It is noteworthy that the percentage of people willing to pay for the pine forest conservation has risen (from 63% in 2000 to 80% in 2012).

The economic assessment of Timiryazevo pine forest ecosystem services indicates that the forest is most valuable as an ecosystem, which is proved by the total cost of ecosystem services (23 million dollars), with recreation and culture services making up the major share.

It is important to note that the integrated economic assessment combines market and non-market based approaches. This socio-economic assessment of recreation services in terms of WTP does not only present the value in financial equivalent, but also provides information on the causes for changes and the impact on the population. Also, the information obtained contributes to recreation resources management planning.

When asked the question, “Do you think that Timiryazevo pine forest has changed over the past 10 years?”, 55% responded “Yes, the forest environment has degraded”, 12% answered “Yes, the pine forest environment has improved”, 4% said “No, the forest environment has not changed”, and 29% neither agreed nor disagreed.

When asked the question, “Does Timiryazevo pine forest satisfy your recreation needs?”, 16% responded “Yes, completely satisfies”, 63% answered “Yes, but the forest management could see some improvements”, and 21% said “No, I prefer visiting town parks”.

The survey results indicate that Timiryazevo pine forest is important for inhabitants, who are aware of current challenges and are interested in the forest conservation. Therefore, when developing management mechanism, it is necessary to focus on Timiryazevo pine forest ecosystem conservation.

The example analyzed proves the importance of non-market approach to economic assessment in terms of WTP and demonstrates its integration in decision-making process.

This research contributes to clear understanding of challenges and objectives of recreation resources management, which should ensure both biodiversity conservation and efficient operation of ecosystem services. We suppose that when designing a recreation area development project, it is important to use the interdisciplinary approach. It is also necessary to make a biophysical assessment of the area (ecological capacity and environmental carrying capacity), as well as socio-ecological economic one, which provides information for management decision making. Both approaches being integrated, it is possible to make a complex assessment of social and economic aspects.

In our opinion, it is necessary to provide a legal and regulatory framework for design and implementation of recreation area development projects; the companies should make ecosystem services assessment before the project design and on the basis of the appropriate methodological approach, which implies:

- choice of ecosystem services to be assessed;
- choice of assessment methods in compliance with international assessment standards, including market and non-market methods;
- social survey to determine the value of recreational, cultural and aesthetic services for recreation purposes with the assessment of willingness to pay for area conservation and development.

The methodological approach described above will reduce the risk of government and private financial losses while implementing recreation area development projects, as well as mitigate the damage to the social and economic interests of inhabitants.

Conclusion

Recreation resources perform a number of functions in sustainable development of urban areas: social (reclamation of human resources), economic (the income from tourism and recreation industry), and ecological (biodiversity conservation and environmental monitoring).

At the stage of recreation area design, environmental and social aspects of the area development remain beyond the scope of attention, which causes risks for implementation of recreation resources development projects and leads to land degradation.

To ensure sustainable development of the recreation area and steady income from tourism business, it is necessary to make ecological-economic assessment of all ecosystem services of a particular recreation area.

To make an economic assessment of the recreation area, one should use the methodological approach based on integration of market and non-market methods, since the latter allows finding out the population preferences and estimating the ecosystem value.

Abstract

Decision making can be a problem for businesses and decision makers these days; therefore, knowledge management (KM) activities play a significant role in any organization. The value of knowledge depends on its application and use. The success of an organization largely depends on the quality of the knowledge that it generates. An extensive literature review has enabled the authors to observe that incorporating KM activities (knowledge discovery, knowledge capture, knowledge sharing, and knowledge application) and phases of the decision making process (intelligence, design, choice, and implementation) has not been clearly highlighted. The aim of this paper is to create a conceptual model highlighting KM activities as a tool for making better decisions in an organizational setting, to make activities more effective and efficient when large amounts of knowledge are involved.

Keywords: Knowledge Management, Knowledge Management Activities, Decision Making Process.

1. Introduction

In the last decade, several decision makers in organizations have started the development of their own knowledge management (KM) systems in order to encourage better decision making. Additionally, decision making requires the use of KM activities. Therefore, knowledge is vital in decision making situations involving uncertainty and complexity. To date, the companies' interest in a correct KM system has grown more than interest in mere knowledge itself. From this point, Elsayed et al (2013) noted that Decision Support Systems (DSS) are witnessing continued growth. Therefore, numerous organizations have improved their data warehouses and use KM for decision support activities.

Additionally, Silwattananusarn and Tuamsuk (2012) noted that understanding the knowledge is becoming important for organizational source that offers a competitive advantage and gives rise to KM initiatives. Moreover, KM is one of the most important topics of the day. This is because KM is a conscious strategy for transferring the correct knowledge to all employees in an organization at the precise time to support sharing and allow the information to be converted into action to develop organizational performance (Al-Dujaili, 2011). In another study by Noman and Aziz (2011) explained that most employees can realize that KM is designed and structured perfectly to backing the process of decision making by apply of knowledge.

While several studies relating to KM activities and decision making phases have been accomplished, there has been a lack of literature addressing the issue of observing the activities as integrated model. Out of those, a few studies deal with why and how KM activities and decision making phases can be successful and what techniques employees utilize to improve decision making. Thus, this paper attempts to add value to this field by applying one of the concerns related to KM activities and decision making

phases, and by providing the tools and a consistent technique for engaging the employees in an organization as an active model.
The paper is organized as follows: In section 2 is a Literature Review, and some research works reported in the literature are briefly described. The proposed model for KM activities and decision making phases is discussed in section 3. The last section concludes the paper.

2. Literature Review

2.1 Knowledge Management Concept

KM is the basis of organizing resources to achieve scientific and effective goals. A study by Alavi and Leidner (2001) explains knowledge in five perspectives: state of mind, object, process, access to information, and capability. Additionally, Robinson (2005) states that KM relates to unlocking and leveraging the different types of knowledge so that it becomes accessible as an organizational asset; applying KM allows an organization to study from its corporate memory, share knowledge, and identifies competencies in order to become a forward thinking and learning organization.

In another study, by Herschel and Jones (2005) defined that KM as collaboration, content management, organizational behavioral science, and technologies to create, store, retrieve, distribute, and analyze of knowledge. Additionally, Ribino et al (2009) explains that KM contains a technique that utilizes information technology tools for the management of information, and its aim is to enhance the efficiency of work teams; it studies methods for making knowledge explicit and sharing a firm's professional expertise and informative resources.

2.2 Knowledge Management Activities

KM activities are becoming an increasingly essential component of organizations' operations. Additionally, in order to develop robust KM activities, a number of models must be taken into account. From the KM activities aspect, the following research has been carried out in different branches. Murphy and Jennex (2006) explain that KM is a system established to assist workers in identifying, sharing, retrieving, and utilizing the knowledge they want.

Additionally, Al-Dujaili (2011) expound that a KM system is the structure required for an organization to apply its KM processes. This development can be seen as a 'knowledge platform', where the goal of the KM system is to support the construction, sharing, and application of knowledge in organizations. In this aspect, Dalkir (2005) suggested that KM process emphasized on knowledge flows and the process of creation, sharing, and distributing knowledge.

In general, KM activities involve four processes, namely discovery of knowledge, knowledge capture, knowledge sharing, and application of knowledge. For each process, there are different techniques and practices used. Recently, Alhawari and Al-Jarrah (2012) developed a conceptual model of a KM process on organizational performance based on these four processes.

2.3 Decision Support System Concept

There are several motives that drive decision makers to make decisions, as mentioned by Borissova and Mustakerov (2012). They compare DSS to a computer-based information system that supports business and organizational decision making activities.

Additionally, DSS is constructed around the ideas of any decision maker within the organization. A recent study by Ben Yahia et al (2012) explains that decision making, wherever and whenever it occurs, is main to an organization's success. In order to create the right decision, teams, individuals, and organizations need both KM and collaboration to create that more effective and efficient decision. In another study by Wimmer et al (2012), it was noted that it is knowledge that directly communicates to the decision making process of the exact decision. Merging the many sources of data into a unified knowledge warehouse delivers many advantages to the decision makers in organizations.

The importance of having technology as a defense mechanism for decision makers has been mentioned by Shim et al (2001), who define that DSS are like computer technology solutions that can be used in organizations to support difficult decision making and used for problem solving techniques.

2.4 Decision Making Phases

Today, almost all business data is stored in data stores, whereas decision making still relies upon an element of this data. Additionally, new business model trends for management of the extended organization to consider include more appropriate and suitable decision making phases to enhance motivation.

Moreover, these decision making phases can be used by decision makers. In a study by Borissova and Mustakerov (2012), it is explained that an essential step in the DSS design process is to describe how the system transforms data. For that goal, data flow diagrams are utilized to describe how data is processed and stored. They also show the points of data entry and exit, and are an important tool in supporting and building a logical model of the designed system. Additionally, Al-Zhrani (2010) explains that the process of decision making in any business is an inherently critical aspect not just for organizations but also for individuals who really trust in these decisions for their survival in the highly competitive arena of entrepreneurship.

In a newly proposed decision making process model by Simon (1977), four stages were involved: Intelligence, Design, Choice, and Implementation. Each stage might go through a reiterative process until the ultimate result occurs.

The stages are described as: (1) Intelligence: the stage consisting of scanning the environment, identifying problem situations or opportunities, and monitoring the outcomes of implementation; (2) Design: finding/developing and analyzing possible courses of actions, wherein a model of the decision making problem is constructed, tested, and validated; (3) Choice: this stage includes the search, evaluation, and recommendation of an appropriate solution to the model; and (4) Implementation: The final phase applies a suggested solution to work.

Several stages of the decision making process presented a lack of clarity of knowledge and detail when performed by the decision maker. Moreover, scholars found that some decision makers do not utilize technical resources in the phases of decision making. Nevertheless, decision making should go through several phases by using KM activities before being finalized by the decision makers. These issues motivated the authors to present a new conceptual decision making process model, describing the phases in detail by using KM activities.

2.5 The Relationship between Knowledge Management and Decision Making

In the earlier sections of this paper, there have been discussions on the KM concept, KM activities, DSS concept, decision making phases, and the motivation for conducting and integrating KM activities and decision making phases to assist decision makers in making their decisions more appropriate by using

knowledge-based DSS. Knowledge becomes the basis for rational decision making. In a study by Arnott and Pervan (2005), it was presented that the most important types of DSS are Knowledge Management-Based DSS: systems that support decision making by aiding knowledge storage, retrieval, transfer, and application.

Recently, García-Manotas et al (2010) explained that knowledge-based DSS holds up organizational decision making activities on the basis of the knowledge accessible concerning the domain in question. A study conducted by Al-Dujaili (2011) describes KM as a the most important area of research. And despite its theoretical development, large scale real life applications of decision making systems are lacking. From this point, several organizations observe knowledge as a strategic resource and the capability to bring that knowledge to bear on decision making as a strategic competence (Zack, 1999).

Additionally, Molina (2005) explains that knowledge representation techniques from the field of artificial intelligence have been commonly used in the development of DSS. Moreover, Mohammed and Jalal (2011) explain that the business has become a knowledge base that is used for decision makers' as intellectual capacity.

Furthermore, Hassan et al (2011) noted that enhancing KM efficiency can not only support decision makers in doing their task faster, better, and cheaper, but also allow several groups to share and reuse various sources. It is the solution for success in real-time decision making. Additionally, Ben Yahia et al (2012) stated that decision making is one of the significant processes where we require both KM that emphasizes on the creation, storage, sharing, and application of knowledge and collaboration to make more effective and efficient decisions in the organization.

Recently, Chike (2010) confirmed that it is required to present an effective KM strategy both for the advantage of an organization's employees and customers in order to support the decision making process and thereby stay sustainable. Additionally, Noman and Aziz (2011) explain that many employees in organizations use the connection between KM and decision making because KM is a very good factor of an environment to support decision making.

3. Research Model

Fastened in with previous studies, this paper is introducing a new conceptual decision making model to describe how decisions succeed, which defines the activities applied by the decision makers by including the KM activities (Knowledge Discovery, Knowledge Capture, Knowledge Sharing, and Knowledge Application).

A set of causes, such as technological advancement, globalization, information technology, communications, and heavy use of internet drives to change the shape of competition in the business place, leading to the development of new models of decision making within the KM activities model.

Based on the literature review, the authors have developed and incorporated KM activities and phases of the decision making process (intelligence, design, choice, and implementation) as a Conceptual Model, as displayed in Figure 1.

Moreover, in order to set the conceptual model into shape, the systemic support leverages and every part of the KM activities and phases of the decision making process are fully discussed in this section.

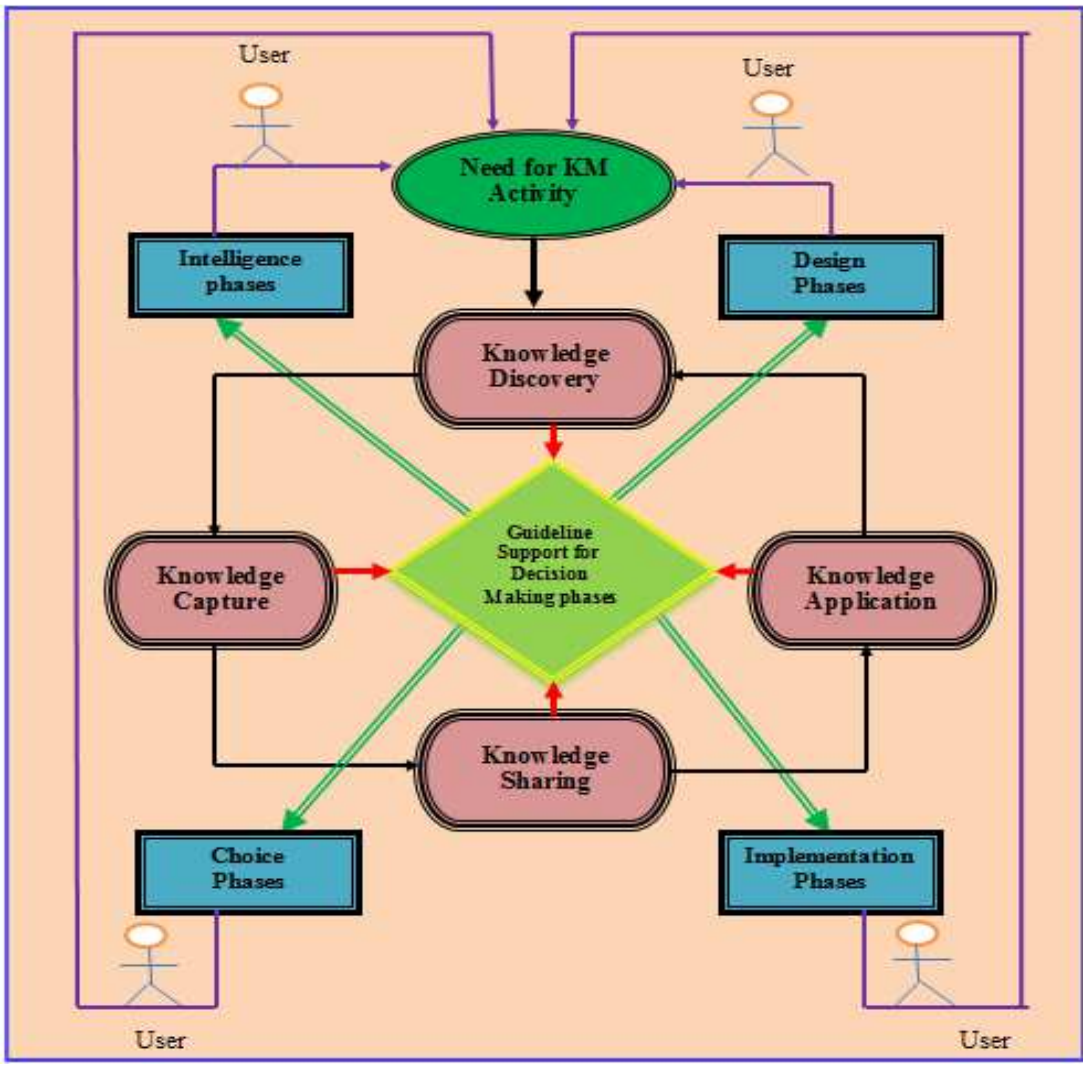

Fig 1: Conceptual Model for KM Activities and DSS Phases

3.1 Knowledge Management Activities

Defined as strategies, these include the effective use of knowledge that reflects positively on decision making and allows business organizations to have a competitive advantage. KM processes are also based on the latest knowledge systems, which provide the latest equipment and tools, methods and techniques that help employees and enable them to capture, share, and deal with knowledge in making decisions effectively.

Nowadays, business and/or government organizations are motivated to quickly improve and enhance their decision making abilities; accordingly, it has become a significant theme at several large business organizations to have a KM system in place to ensure that its decisions effectively employed in organization in any time. So, we should have an economic vision to reply successfully to difficulties and keep up with worldwide changes to resolve any imbalances; this could not happen without the organizational expertise KM systems offer that can impact a board's decision making efficiency and effectiveness.

3.2 Decision Making Phases

We will see in practice how far the concept of KM activities will affect decision making phases. This model is proposed as a conceptual frame work to utilize various KM activities that are associated with management experience in the decision making phases and enhance the impact of those activities.

In general, identifying problems requires the collection of all information relevant to the decision, which should come from the external environment and what is associated with it, including the risks, challenges and prerequisites. In addition to that, the internal environment and its segments of financial, material, and human resources to empower it to decide the needs and the utilization of information, knowledge acquisition is a tool that enables the knowledge to be applicable in more effectively, and how we can promote the acquisition of knowledge which, using the most recent innovation, gives precise information which can be processed to extract knowledge from different resources.

In order to create, develop, and analyze alternative courses of action we need to generate knowledge, which is a critical step in the knowledge management process. It is based on creative capabilities and innovative ideas, as the generation of knowledge relies on new ideas and adds backing to internal and external performance, not the generation of a custom that raises the business sector estimation of the organization. The knowledge generation process deals fundamentally with human resources and human capital, which is the most essential hotspot for the creation of innovative thoughts, so organizations are keen to attract and recruit talent and support, and provide the prerequisites to achieve career satisfaction and develop their abilities which, in turn, reflects positively on their performance (Bergendahl and Magnusson, 2015).

Generating, evaluating, and selecting a course of action from those available choices relies on how well the knowledge has been described for future application and how effectively it can be utilized to impact the choice. Knowledge sharing has an added value, so knowledge and intellectual resource sharing is an important phase which supports an active task of decision choices based on the state, it might take different forms depending on the area of the business, so that organizations and business managers remain keen to encourage their staffs to share knowledge internally among its representatives, experienced and new workers, and abroad with different organizations, and come up with novel innovative concepts that support the organization to reach its best gains. Nevertheless, organizational workers should have some basic skills, technical knowledge, which would enhance their performance and help them achieve the right decision successfully.

To enhance the implementation phase of decision making, the organization should understand the dimensions of the KM application factors, which are human resource, internal operation, the information technology infrastructure, and the culture of the organization. These can assist in the implementation phase of decision making; knowledge application is the most essential phase of the knowledge management process, as it moves from hypothetical to reality and determines the validity and ability to add positive acts of corporate changes.

The knowledge management process cannot achieve any goal unless applied in the frame and a plan set for it and, in doing so, companies can make their goals, take advantage of the resources available to them, and improve their management, performance, productivity, and marketing operations, as the application of knowledge is a prerequisite to reaching the highest competitive position, much like a strategic asset requires special software capable of directing knowledge and draws interest.

4. Conclusion

In the current paper, a framework of decision making phases for the decision maker is proposed. It integrates KM activities with the phases of the decision making process as a Conceptual Model. To the best of the authors' knowledge, there are few decision making phase models in the literature, which includes a more detailed description of activities of KM such as Knowledge Discovery, Knowledge Capture, Knowledge Sharing, and Knowledge Application. Based on the topic of this research, this paper concludes that KM activities would present the broadest analysis of the decision making phases (intelligence, design, choice, and implementation) as a conceptual model. The benefits of the proposed model of decision making for the decision maker, is efficient for the decision making process and choice optimization of the solution for any problem , and to make a decision in a specific problem setting.

Framework for Strategic Change Management – Theory and Praxis

Libor Gála, University of Economics Prague, Prague, Czech Republic, gala@vse.cz
Martin Hladík, Ness Technologies, Prague, Czech Republic, martin.hladik@ness.com

Abstract

This paper introduces the authors' original framework for strategic change management as a result of their research. It includes the definition and description of the framework, as well as its formation process based on Peffer's design science research methodology. The framework supports the planning and execution of strategic change. The framework follows Kotter's view of a change process, and is enriched by enterprise architecture principles and the social and human aspects of change. The framework was validated in a real case where it was implemented in an innovation management process of a firm.

Keywords: change management, strategic change, framework, design science research.

1 Introduction

The current business environment is characterized by accelerating change (e. g., Daft, 2007). To survive, firms have to respond to changes in their business environment through the improvement of their product or services, processes, technology, or more often by adapting their whole business model. However, change within a firm is complicated and very often does not meet the initial expectation. According to a number of sources (e. g., Kotter, 1996; IBM, 2008), 60 – 70 per cent of changes were either not delivered on time, budget or of the required quality.

Therefore the authors studied various theories and methods, such as organizational theory, system theory, human resources management, change management and enterprise architecture, to find the right approach to firm change. Based on the research gap they identified, they formulated their own original framework for strategic change management entitled 'Enterprise Architecture-based Change Process' (EABCP). The framework follows Kotter's view of a change process (Kotter, 1996), and is enriched by enterprise architecture principles and the social and human aspects of change. The framework details, including previous research, are presented in Sections 3 through 5.

The framework should support the strategic change of a firm. Various resources focused on change management (e. g., Kotter, 1996; Luecke, 2003; Bevan, 2011) often use the term 'change', but they lack of its definition. To correct this, the authors use Hofer's definition of strategic change (Hofer, 1978). He defined strategic change as a change that relates to a firm's strategy content (e. g., a change in the business model, resource allocation, competitive advantage or synergies). It this paper 'change' is synonymous with 'strategic change'.

The authors' approach to the framework formation is based on Peffer's design science research methodology (Peffer et al., 2012; for details see Section 2). A part of the authors' research was the validation of their framework usability. The framework was used in a real situation of innovation management process implementation (see Sections 6 and 7), and has been presented and discussed several times at academic conferences (see Section 8).

2 Research model

In this paper, the authors present their original framework for strategic change management. Its formation is based on the design science research methodology (Peffers et al., 2012). This methodology provides a quite comprehensive framework for conducting design science research in information systems. It includes a process model for doing design science research, and it provides a mental model for presenting and evaluating design science research.

The authors' work follows the six steps of the design science research process model:

- Problem identification and motivation;
- Definition of the objectives for a solution;
- Design and development;
- Demonstration;
- Evaluation;
- Communication.

The specific details of the authors' original framework formation are briefly introduced in Table 1 below, and they are described in the following sections of this paper in more detail.

Table 1 Formation of the authors' original framework for strategic change management based on the design science research methodology (source: Authors)

Step No	Design science research step	Activity of the authors' original framework formation
I	Problem identification and motivation	• The authors' survey on firm change success in the Czech Republic • Analysis of various change management resources incl. surveys on firm change success
II	Definition of the objectives for a solution	• The main goals are: formation of a framework for strategic change management, and evaluation of the framework usability and contribution in change management (incl. definition of specific objectives for the framework evaluation)
III	Design and development	• Analysis of various relevant resources to identify the research gap (change management, organizational theory, system theory, project management, enterprise architecture) • Construction of a framework for strategic change management
IV	Demonstration	• Demonstration of the framework usage in the case of an innovation management process implementation
V	Evaluation	• Evaluation on the basis of the specific objectives defined in step 2
VI	Communication	• Presentation of the framework at a few conferences

3 Problem identification and motivation

Changing a firm is complicated, as a number of resources have documented (e.g., Kotter, 1996; IBM, 2008). The authors analyzed the reasons for change failure identified by these resources with the following results:

- Drucker (2006) indicated the main reason for change failure is disregarding the human factor (e.g., ability to accept a risk; focus on long-term goals rather than short-term);
- Kotter (1996) named eight common errors that lead to change failure, the majority of them are related to the human factor as well as firm culture;
- IBM conducted a large worldwide survey (2008) and confirmed the previous research results on change failure; it identified the following, human factor related, main challenges of change: changing mindsets and attitudes (58 per cent), firm culture (49 per cent), complexity is underestimated (35 per cent), lack of management commitment (32 per cent), lack of motivation of involved employees (16 per cent).

The authors conducted their own survey on firm change success as well. They surveyed 245 respondents from different industries in the Czech Republic and obtained 62 responses that make up the following results:

- The change failure rate was 58 per cent, but information technology (IT) changes failed more often (67 per cent);
- Key failure factors were: misunderstanding change benefits, insufficient competence of management and an inadequate understanding of the change sense (see details on Fig. 1);
- Key failure factors related to IT change were: a lack of firm readiness for change, underestimation of change costs, misunderstanding of change scope and impacts;
- In small firms (up to 100 employees) there were different failure factors: an inexperienced change team (people responsible for the change execution).

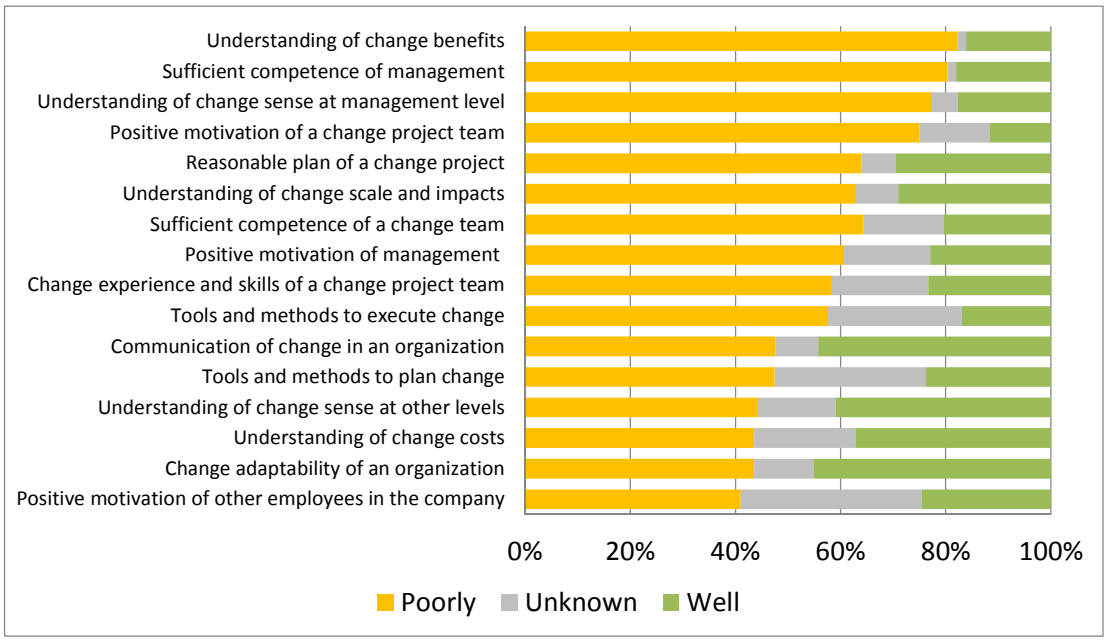

Fig. 1 Well or poorly managed aspects of change according to the authors' survey

Both the resources and the authors' survey confirmed that successful management of firm change is really needed in today's business. The authors, through their extensive resource analysis, did not find a well-structured approach for how to successfully manage change. This research gap supported their intention to formulate their original framework for strategic change management.

A research gap analysis was performed in two steps. The first step, researching several bibliographic databases, did not identify any similar framework, but provided relevant resources for further research (see Table 2). They identified four areas (that are reflected in their framework as well) as critical aspects of successful change. In the second step, they studied various resources on change management, organizational theory, human resource management & system theory, and enterprise architecture to check their coverage of the four areas. It also expanded their knowledge, which helped the authors to construct their framework (the framework itself is introduced in Section 5).

Table 2 Research gap analysis: it expresses individual resource coverage of the four aspects selected by the authors as critical for change success (source: Authors)

	Change process	**Enterprise architecture**	**Social aspects**	**Framework**
Change management				
Kotter	Yes	No	Yes	Partially
Luecke	Yes	No	Yes	Partially
Daft	Partially	Partially	Yes	No

4 Definition of the objectives for a solution

In their research, the authors formulated their original framework for strategic change management. At the beginning of their work, they defined the following objectives:

- **Objective 1**: Construction of the framework

- **Objective 2**: Evaluation of the framework (the sub-objectives below presents how the evaluation of the framework would be performed):
    - **Sub-objective 2.1**: Explanation of the framework and its usage in a specific case to a change sponsor and a change manager. It would be passed if a sponsor accepted usage of the framework in change.
    - **Sub-objective 2.2**: Usage of the framework for change planning. It would be passed if the outputs listed below were created, met quality criteria (see Table 3) and were accepted for change execution by a sponsor.
    - **Sub-objective 2.3**: Evaluation of the framework contribution after change. It would be considered successful if the defined criteria were met (see Table 3).

Table 3 The framework's evaluation criteria (source: Authors)

Criteria	Metric	Weight (per cent)	Evaluator
1. Which parts of the framework have been considered successful?			
1.1. Is it possible to create a change plan according to the framework (change process)?	Yes / No / Partially	15	Change sponsor
1.2. Is it possible to perform a change impact analysis according to the framework (5+1 model)?	Yes / No / Partially	15	Change sponsor
1.3. Is the framework supportive enough from a social and human perspective?	Yes / No / Partially	15	Change sponsor
2. Is it possible to use the framework in a real case?	Yes / No / Partially	55	Change sponsor
Interpretation of results: • The framework would be proved effective if it scores at least 1.3 points; • The framework would be partially proved effective if it scores at least 0.7; • Otherwise the framework would not be proved effective.			

5 Design and development

The authors' original framework (EABCP) supports the change of a firm. According to system theory (e.g., Mildeova, 2008), firms, as complex social systems, are difficult to analyze, understand and change because of their size, interdependency, dynamics and human nature. Therefore, the authors studied various theories and methods such as organizational theory, human resources management, change management, enterprise architecture and system theory to understand the context of firms better. Part of their studies focused on the change of a firm and the analysis of change failure factors. They addressed these factors by forming the framework.

The purpose of the framework is to support the strategic change of a firm. The framework is mainly focused on two areas of change activities: change scope and impact analysis and change process planning. The analysis of change scope and impacts is supported by the 5+1 model of the framework. The change process planning follows the change process component of the framework (see Fig. 2).

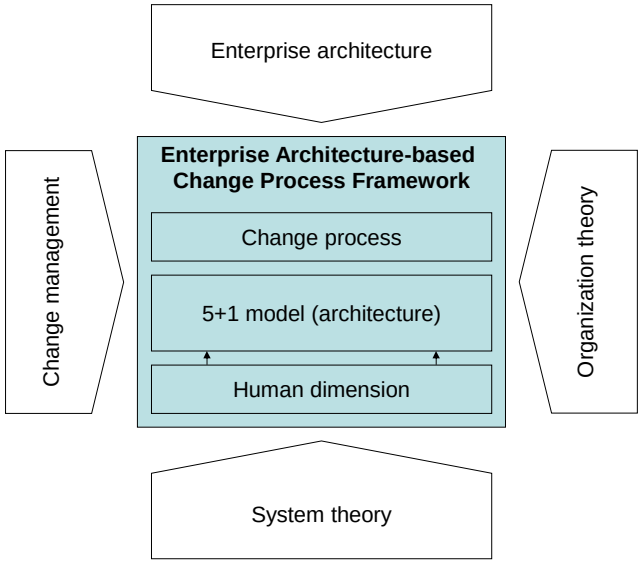

Fig. 2 The concept and main components of the EABCP framework: Change process,

The authors present the following key principles for better understanding the framework and its usage. The principles are founded on the basis of change management and other recommendation. From these, the authors selected the following five principles that they consider the most important:

1. Large change projects usually need wide and long-term support across the whole firm. Therefore first, before the change process is being planned, you should start by establishing a sense of urgency and creating a guiding coalition (Kotter's first two steps of his 'Eight Step Process for Leading Change').
2. A good change plan is developed on the basis of the logic of the project management planning approach. It starts with understanding the scope of the change, going on to identify change activities, resources and risks, and finishing with time and cost planning.
3. The scope of a change is usually part of a real firm that is impacted by the change. As the firm is a complex social system, it is important to understand its interdependencies, dynamics, and the human dimension. This knowledge of a firm should influence both the analytical and planning activities of the change.
4. In any change, it is important to define objectives, both from long- and short-term perspectives.
5. Firm change impacts people in a firm and therefore it is often the most difficult part of change activities. Thus, communicating with and engaging the people involved are crucial for a successful change. Both communication and engagement should be key parts of a change plan.

The 'Enterprise Architecture-based Change Process' framework is defined by the authors as:

- A change planning tool as it defines a change project lifecycle, its milestones and objectives (see below for details). It should be used together with project management practice (e.g., the planning process explained above), and it can be combined with similar enterprise architecture approaches (e.g., Architecture Development Method in TOGAF; The Open Group, 2009);
- An analytical tool for better understanding the part of a firm impacted by a change. It is focused on understanding the business context of a firm from a strategic point of view, and knowing the firm's human dimension (for details see below). It should be used together with other analytical

tools that are useful for analyzing and modelling specific views of a firm's architecture (e.g., Business Process Modelling Notation for design of business processes).

One of the key aspects of a successful change is the right managerial approach. Based on Veber (2011) and Kotter (1996), the authors suggest handling change as a project and therefore using the appropriate project management practice. All projects should follow the 'purpose-based' steps (phases) that are together understood as a lifecycle. The authors' proposal on a change project lifecycle is based on Kotter's 'Eight Step Process for Leading Change' to include his change theory and experience in the framework (see Fig. 3). Some other resources (i.e., Luecke, 2003, or Daft, 2007) propose similar several step approaches as well.

First, the preparation phase starts with understanding the catalyst for change (e.g., Veber, 2011), or more precisely, why the change is needed. As explained before, a large change needs to be supported by many people (stakeholders), therefore it is advisable to create a collation of stakeholders that together create a draft of the change vision. The vision, in this phase, should provide clear options for possible change scenarios. It should also provide the objectives that will be achieved when the change is finished.

Next, the planning phase is responsible for the development of a change project plan. The change project plan includes all the perspectives according to project management practice: i.e., the scope, project activities, resources, risks, time and costs. To be able to make a plan, you have to analyze the scope first. As mentioned in the previous text, the subject of analysis is a firm and it requires a specific analytical approach as it is explained in the following section. This phase is finished when the plan has been created, is understood by the stakeholders and they commit their full support during the whole change project.

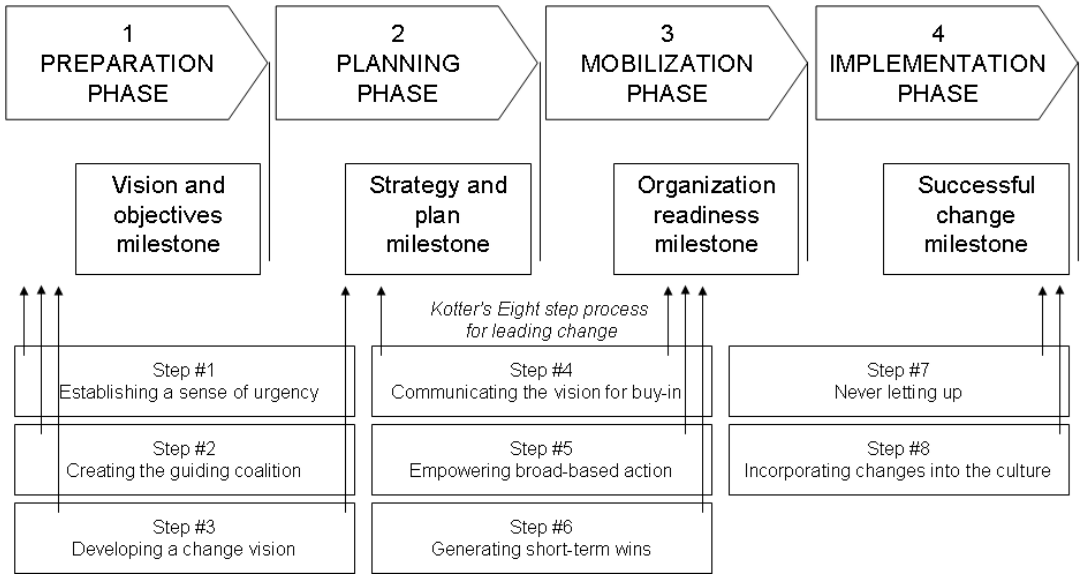

Fig. 3 Change process definition in the EABCP framework and its relation with Kotter's 'Eight Step Process for Leading Change' (source: Authors)

The main reason for the authors' improvement on the enterprise architecture analytical approach is driven by a need to understand the business of a firm (e.g., the business model, the organization of a business, etc.) in order to define the change project scope. It includes an understanding of the social and human aspects of both a change and the firm impacted by a change. These aspects are addressed by the human dimension of the framework (see Fig. 4).

The authors suggest imagining a firm in architectural 'layers', similar to both enterprise architecture and service oriented architecture (e.g., Lankhorst, 2009) practices. These are two of the authors' significant improvements represented by the alignment between the 'layers' and the business model (driven by a need to understand the business), and by the human dimension.

The scheme described in Figure 4 represents the authors' suggestion of a layered view of organization (firm) architecture known as the 5+1 model (five architectural layers plus the human dimension layer). Here it is compared with the ArchiMate model (Lankhorst, 2009) to provide a better overview of the 5+1 model's logic. There are three important differences:

- The human dimension (vertical layer) is included as explained above.
- Both the Customers and Customer Services layers are understood more from conceptual business or strategic point of views (see explanation below).
- The Services and Components layers are recognized as business parts on a detailed level of an organization. Possible information technology (IT) related layers (e.g., Application and Infrastructure layers according to ArchiMate) are understood as subsets of them. TOGAF offers a similar concept in its explanation of the relationship between the Business and IT-related architectures.

The authors explain the concept of the layers in the 5+1 model as follows:

- The Customers layer represents specific groups of customers that are served by tailored products and services.
- The Customer Services layer represents the sales and delivery of a product or service, as well as overall communication with clients.
- Business Processes ensure that customer services work as well as other internal organization functions.
- Services are a more detailed view of business processes according to Service Oriented Architecture and Business Process Modelling Notation principles.
- Components physically provide the services. They can be represented by people, technology, or a combination of the two.

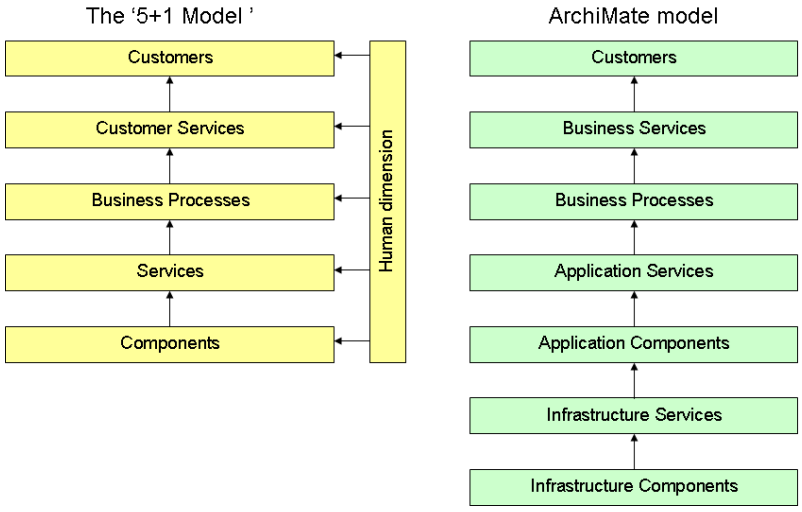

Fig. 4 Comparison of the 5+1 model and ArchiMate model (source: the authors)

6 Demonstration

The authors evaluated their original framework in case of the implementation of the innovation management process in a real firm. The implementation was carried out in a Czech IT- firm (450 employees) from June to December 2013. The innovation management process was designed for (pilot) the management of two innovation projects. Seven employees from various departments took part in the planning process. The innovation management process was specified according to the Innovation Pentathlon Framework (Goffin and Mitchell, 2010).

The Innovation Pentathlon Framework consists of five parts, as Fig. 5 shows. According to this framework, the innovating is directed by the 'Innovation strategy'. Then specific innovations are born in the 'Ideas' part and the best are selected (Prioritization) to be supported in their development (Implementation). These three parts together are called the Development Funnel. Of course, the innovation management process has to be supported by the firm's environment, which is expressed by the 'People and organization' part. It includes the human and social aspects, which are similar to the view of change theory.

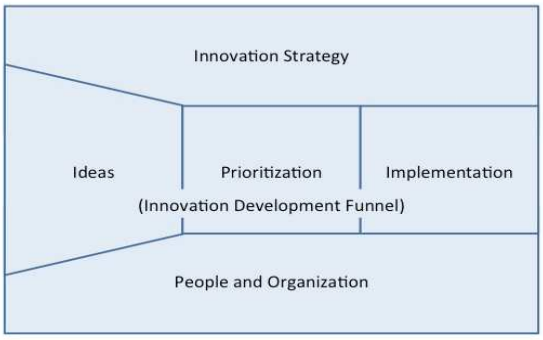

Fig. 5 The Innovation Pentathlon Framework (Goffin and Mitchell, 2010)

In the following text, the authors suggest how to utilize specific parts of the Innovation Pentathlon Framework in their change process framework, namely in its change process, 5+1 model and human dimension.

The purpose of the change process is to reduce the risks of change planning and execution by understanding the change flow logic. The authors propose specific activities related to the innovation management process implementation that should be handled during the change (implementation). These activities come from the generic recommendation of the change process framework (incl. human dimension specifics) and are enriched by the innovation management specifics (see Table 4).

Table 4 Recommended process of innovation management implementation (source: the authors)

The change process phase	Activities according to the Innovation Pentathlon Framework
1. Preparation	• Visioning • Alignment with a firm's business strategy • Gaining management support • Creation of a supportive team
2. Planning	• Selection of the innovation management framework (e. g., the Innovation Pentathlon Framework) • Design of the innovation management process (incl. impacts on the

The change process phase	Activities according to the Innovation Pentathlon Framework
	firm, assumptions, etc.) • Planning (incl. business case) • Review of the management support • Communication
3. Mobilization	• Pilot project and first quick wins • Review of the plan • Review of the management support • Communication
4. Implementation	• Execution of the change • Evaluation of the change • Innovation management process kick-off • Review of the management support • Communication

The innovation management impacts on a firm should be analyzed and designed on the basis of the 5+1 model. The authors suggest using the 5+1 model as demonstrated in Table 4. In their opinion, a firm can only start using certain processes of the Pentathlon Framework, or the usage specifics can be defined differently according to the type of innovation. The right focus of the usage should be defined in the innovation strategy (it is a mandatory process only). Therefore, the usage demonstrated below can only be defined as a subset. The human dimension is represented by the last item in the Table 5.

Table 5 Change scope definition according to the 5+1 model (source: the authors)

Architectural layer according to the 5+1 model	Innovation management process impacts on a firm
Customers	• Customer engagement in an innovation process (e. g., customer research, testing, cooperation in the innovation development, etc.)
Customer services	• Requests for customer engagement • Specific processes to engage customers
Business processes	• Innovation strategy definition process • Idea generation process • Idea selection process • Innovation development process • Innovation transition process • Innovation management process • Support processes (resource management)
Services	(not discussed in this paper)
Components	(not discussed in this paper)
Human dimension	• Identification of the customer impact (engagement) • Identification of the innovation process sponsors • Identification of the impacts on employees • Identification of the impacts on vendors (in case their participation is necessary in the innovations) • Communication plan • Identification of change agents and resisters • Motivation plan • Responsibility plan

The authors' proposal on the usage of their change process framework in innovation management process implementation is currently under-tested in a real firm environment. Therefore, the proposal should only be taken as theoretical, despite the fact that it was created on the basis of their comprehensive research on both change management and innovation management.

7 Evaluation

The framework was proved effective, as introduced in Section 4 and demonstrated in Section 6, in the change of a real firm. This change brought a new innovation management process into the firm. The method of evaluation is specified in Section 4 as well. The authors' original framework was successfully proven (for details see Tables 6 and 7).

Table 6 Overall results of the evaluation of the framework (source: the authors)

Objective	Result
Objective 1: Construction of the framework	The framework was constructed (for details see Section 5)
Objective 2: Evaluation of the framework	Results achieved in sub-objectives below
Sub-objective 2.1: Explanation of the framework and its usage in a specific case	The framework was accepted as a method for change management in a specific case (implementation of innovation management process, for details see Section 6)
Sub-objective 2.2: Usage of the framework for change planning	Expected outputs (for change planning purposes) were created and accepted for change execution
Sub-objective 2.3: Evaluation of the framework contribution after change	Evaluation of the framework use was positive (see details results in Table 7)

In sub-objective 2.3, where the framework was evaluated by a change sponsor, it got 1.45 points (according to the evaluation method defined in Section 4), which means it is possible to use the whole framework without troubles.

Table 7 Results of sub-objective 2.3: contribution of the framework (source: the authors)

Criteria	Metric	Evaluator
1. Which parts of the framework are proven?		
1.1. Is it possible to create a change plan according to the framework (change process)?	Yes	Change sponsor
1.2. Is it possible to perform a change impact analysis according to the framework (5+1 model)?	Yes	Change sponsor
1.3. Is the framework supportive enough from the social and human perspective?	Yes	Change sponsor
2. Is it possible to use the framework in a real case?	Partially (5+1 model use is limited to people knowing ArchiMate)	Change sponsor

The authors summarize their framework contribution on both the theoretical and practical levels. On the theoretical level, they emphasize:

- Existence of the framework – it provides a comprehensive method for the support of strategic change management;
- Connection between change management theory and enterprise architecture;

- Architecture view supporting alignment between business and information technology;
- Focus on social and human aspects in strategic change and enterprise architecture.

From a practical point of view, they point out the following contributions of their framework:

- Better understanding of strategic change scope and impacts;
- Recognition of social and human aspects of change and its reasonable management;
- Well prepared plan of strategic change;
- Increase in strategic change success.

8 Communication

The authors presented and communicated their partial research results as well as the whole framework at several academic conferences (Gala and Jandos, 2010; Hladik, 2013; Hladik and Jandos, 2014). The detailed process of the framework construction, including the research of the related knowledge disciplines (e. g., change management, organizational theory, human resource management, system theory, enterprise architecture) is documented in their doctoral thesis.

9 Conclusion and further research

The authors focused their research on change management and as a result they constructed their original framework for strategic change management. A key part of their research as well as the framework description are presented in this paper.

Their research method is based on the design science research methodology (see Section 2). This method includes the step of evaluation of their research output – the framework. The evaluation was executed in a case of an innovation management process implementation in a real firm. They achieved good results and the framework was finally proved effective. Therefore, they expect to use the framework in other situations and work on its further improvement.

In their further research they will focus on the following topics:

- Continued development of the framework, specifically information technology related change;
- Formation of a ‘health-check’ method for strategic change projects;
- Recommendation for better enterprise architecture use.

Acknowledgment: The authors thank Professor Jaroslav Jandos for his help and advice in the development of this paper.

Effective Selection of Multidisciplinary Working Teams in Manufacturing Companies

Michał Sąsiadek, University of Zielona Góra, Zielona Góra, Poland, m.sasiadek@iizp.uz.zgora.pl
Julian Jakubowski, University of Zielona Góra, Poland, j.jakubowski@iizp.uz.zgora.pl

Abstract

Selection of working teams to realise the dedicated tasks is not easy for the company management staff. They must know their staff professional skills but equally important is to know their personal character traits. The procedure of particular employees' evaluation and their selection to multidisciplinary working teams with the use of the Myers – Briggs type indicator (MBTI) has been presented in this paper. The practical use of the MBTI instrument for evaluation and selection of effective working teams in manufacturing companies has been presented on a real-life example.

Keywords: staff management, MBTI instrument, multidisciplinary working teams.

1. Introduction

Quickly progressing globalisation and competition force the companies to apply methods and techniques assuring strong position on the market. The use of the methodology of concurrent engineering allows the improvement of the efficiency and what is more, it helps to lower the total costs and shorten the time of the designing works. Concurrent engineering has become an effective method of realisation of many tasks regarding developing and introducing of the new product to the market (or modernising of the existing one). Its main assumption is to benefit from the possibility of concurrent realisation of tasks (designing, manufacturing, implementation, etc.) allowing for all the influencing factors in the possibly early stage of their realisation which is described by Myers, I. B. (1980), Ohno T. (1988), Chen Shi-Jie , Mazur Ł., Sąsiadek M. (2013), Trebuňa, P., Kliment, M., Edl, M., Petrik, M. (2014). In concurrent engineering, most designing tasks require the establishment of a multidisciplinary working team. The members of such a working team come from various functional departments of a company and communicate with each other simultaneously at every stage of the task development. The designing team is created for each task and it consists of experts and representatives of various areas of the product life cycle. The task of the team is to identify the potential problems at an early stage and take the preventive measures. A multidisciplinary team consists of the employees representing such areas as: marketing, sales, research and development, designing, manufacturing, purchase, testing, quality control and services. The traits of the team members that increase the team efficiency are among others: functional specialised knowledge, team work experience, communication skills, flexibility in the allocation of work as well as proper personality traits. The understanding of the three major traits which are: functional specialised knowledge, team work experience and communication skills gradually influence the creation of the successful and effective multidisciplinary team.

2. Team Member Model

Differences in personality may influence the individual behaviour as well as the group achievements in an organisation. Cleese J. (1998) pointed out that the team success is formed more by personality than the technical skills of its members. The understanding of personality types may support the selection of proper persons to the team - Zemke R. (1992). The use of a proper personality representation style may eliminate conflicts as well as increase the communication efficiency between the team members and their productivity, more widely is desribed by Chen, S. J. G. (2005), Tomal D. R. (1992), Woźniak W., Jakubowski J. (2015). As a result, many companies apply personality tests in order to evaluate the adaptation of potential employees to the specific character of a particular company.

A very popular personality test for evaluation of interpersonal relations and selection of the team members is the Myers – Briggs type indicator (MBTI). The MBTI instrument was created in order to measure personality preferences and types. It is used in scientific research as well as in the industry. The MBTI instrument constituents are four groups of two contrary preferences -Myers, I. B. (1980):

Favourite world: Extravert (E): the interest and energy are directed at the people's outer world as well as actions. Such a person works in groups. Introvert (I): the interest and energy are directed at the inner world, ideas and internal experience. Such a person works alone.

Information: Sensible (S): the information is processed in a concrete, objective way. Such a person relies on facts, reality, focuses on details. Intuitive (N): the information is processed in an intuitive, subjective way.

Decisions: Thinking (T): the decisions are made on the basis of logic and intellect. Such a person is analytical, logical and objective. Feeling (F): the decisions are made on the basis of feelings and emotions. Such a person has a strong desire to maintain the harmony in the group.

Structure: Judging (J): the approach to the outside world is carefully planned and structured. Such a person makes decisions very quickly. Perceiving (P): the approach to the outside world is elastic and spontaneous. Such a person makes decisions slowly.

Every person has one of the preferences specified above in each of the four groups which constitute 16 versions of personality types, for example a person may be identified as INTP, ENTJ, ESFP, INFJ or one of 12 other possible combinations. Fig.1 presents four tables of the dimensions 2x2 showing positive, neutral and contrary relations for various combinations of personality types. For each of the tables the following grade scale is provided: +9, +3 and -3 for positive (+), neutral (○) and contrary (-) relations.

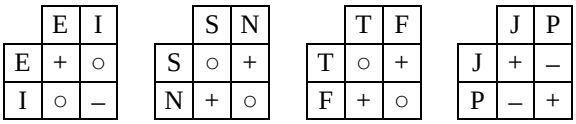

Fig.1 Relation of the personality types: Extravert (E), Introvert (I); Sensible (S), Intuitive (N); Thinking (T), Emotional (F); Judging (J), Perceiving (P) - after Myers, I. B. (1980)].

All the possible variants of the relations between the team members are presented in Table 1. For example, working relation scale of an ESTJ member opposed to an ENTJ member equals 30. It was calculated in the following way: E to E gives positive +9 relation, S to N means positive +9 relation as well, T to T is a neutral relation, which equals +3 and J to J creates positive +9 relation again, altogether its sum is 30. Similarly, working relation scale of an ISTJ member opposed to an ISTP member is (-3 + 3 +3 – 3) = 0 and analogically for the rest. For each of the two types, the higher value in the table presents better working relation between these two types and the other way round. After the MBTI assessment is established, every team member will know which of the 16 types of his or her personality is attributed to him/her and characterises the ease (or the difficulty) of cooperation with others.

3. Practical Application

A survey in which 18 employees took part, has been carried out in the company "x". Every surveyed person was provided with the identifier from A to S and then, on the basis of the survey results, the type of personality was defined according to the Myers – Briggs indicator (MBTI). The table of the working relations between the 18 employees has been established on the basis of individual evaluation (Table 2).

3.1 Selection of Working Teams

Out of 18 employees, three working teams of six people in each team have been selected on the basis of the relations presented in Table 2. Five variants have been created in order to compare the obtained results. The higher the value of the relations between the team members, the better the cooperation between them. Particular variants of the selected working teams are specified below.

Variant I – Team 1 consists of the members: A, C, D, E, I, K

The working relation between the team members: A and C, A and D, C and E, D and E, C and K, D and K equals 30. It is a high relation which proves that the members may create an effective and successful team. The relation between the members A and E, A and K, C and D, C and I, D and I, E and K is 24. The relations of the member I are the highest with the members C and D, therefore, team 1 is the most suitable for him. What is more, the relations of this member with some members from the other teams are 0 which means there is no understanding between them. The total relation sum of the team 1 is 378. Table 3 presents the values of the working relations of the considered team.

Table 2. Table of the working relations between particular employees

I	ISTP						18
K	ESTP						

$\sum = 378$

Table 4 presents teams and their members in variant 1 as well as in the other four variants. Furthermore, each team was evaluated according to the MBTI assessment by calculating the sum of all the relation values between particular team members.

The selection of team members resulted in five different variants with three six-person teams in each. Generating of multidisciplinary working teams was carried out according to the criterion of cooperation effectiveness of particular team members. Analysing the obtained results, it is observed that the highest working relations value exists between the pairs of the persons denoted by the letters: A and C, A and D, C and E, C and K, C and N, C and O, C and S, D and E, D and K, D and N, D and O, D and S. It equals 30 which means that there are high mutual connections and good mutual communication between the team members. Such people should create very effective and successful teams.

Table 4.Evaluation of the team working relations in particular variants

	VARIANT I		VARIANT II		VARIANT III		VARIANT IV		VARIANT V	
Team no.	Team members	Relation sum	Team members	Relation sum	Team members	Relation sum	Team members	Relation sum	Team member	Relation sum
1	A, C, D, E, I, K	378	A, C, I, N, O, S	360	A, D, E, N, O, P	330	A, C, D, N, O, S	408	C, D, I, N, O, S	378
2	F, H, J, L, M, P	270	D, E, F, H, P, R	294	C, F, H, I, K, S	264	E, F, H, I, K, R	222	A, E, H, K, P, R	252
3	B, G, N, O, R, S	192	B, G, J, K, L, M	150	B, G, J, L, M, R	210	B, G, J, L, M, P.	210	B, F, G, J, L, M	210
sum		**840**		**804**		**804**		**840**		**840**

On the other hand, the lowest relations value which is 0 exists between the pairs of persons: I and G, I and J, I and L, I and M. This means that there is no understanding between the members. Such people cannot be in the same working team because they will not be able to cooperate. On the basis of the overall matching indicator of the generated five variants it may be concluded that the most efficiently selected are the variants I, IV and V because their matching indicator is 840. Furthermore, out of the comparison of the three variants (I, IV and V), variant V is the most balanced (in terms of the assessment of particular working teams). The selected personal configuration in particular working teams has been sent to the company of interest in order to verify these teams. The verification process is in progress and when it is finished the variants presented in this article will be compared to the actual traits of the particular employees and their ability to cooperation in terms of effective working teams.

4. Conclusion

Human resources (employees) undoubtedly belong to the most important group of resources at a company. Their knowledge and experience in connection with commitment and engagement constitute a decisive factor gradually influencing internal organisation of the company as well as its competitiveness and innovation of the offered products and services. Selection of the employees, proper use of their qualifications and skills and provision of the proper motivation level are very important for the company's strategy.

An approach for three important traits of a team member (multifunctional knowledge, team work ability and relations at work between the members) has been presented in this paper. The way of generating and selecting of a multidisciplinary team has been described. Three specified personal traits may support the project manager in creation of successful and effective multidisciplinary teams. As a result it is possible to organise working teams with members who, apart from having specialised knowledge in their functional areas, are also capable of teamwork and have good working relations. The development of knowledge quantitative evaluation for the three team-oriented traits of the team members will help to find the best team compositions for successful and effective multidisciplinary teams in concurrent engineering. Nevertheless, it has to be stressed that the approach to team-building is based not only on the team members' personal traits, but also on the product features or the design structure of the tasks aiming at the product development which are equally important and cannot be ignored.

Value Stream Mapping of a Mechanical Assembly Process

Michał Sąsiadek, University of Zielona Góra, Zielona Góra, Poland, m.sasiadek@iizp.uz.zgora.pl
Josef Basl, University of Zielona Góra, Zielona Góra, Poland, j.basl@iizp.uz.zgora.pl

Abstract

This paper presents the analysis of a gear motor assembly process based on the value stream mapping. It describes the steps of creating the so-called present state map, which represents the actual course and parameters of the investigated process. Basing on the analysis of this map the future state map was developed; it suggests changes in its particular areas. Also, benefits of these changes were estimated; the benefits contribute to the improvement of the investigated process realisation.

Keywords: value stream mapping, production process, assembly, increase efficiency

1. Introduction

An essential element of a company activity is creation of a competitive product of high quality as fast as possible and at the lowest cost. These criteria are contradictory in many cases so the companies are forced to take certain give-and-take actions ("quid pro quo"). The tools useful in ensuring that requirements of contemporary market are widely used Lean Production techniques which is described by Czerska J. (2009), Sąsiadek M., Basl J. (2015), Straka, M., Trebuna, P., Rosova, A., Malindzakova, M., Makysova, H. (2016), Womack J., Jones D. (2001) and other. Their practical application has increased recently described by Basl J., Sąsiadek M. (2014), Jakubowski, J., Peterka, J. (2014), Womack J., Jones D. (2001). The mentioned Lean Production techniques (Manufacturing, Management) belong to a group of methods included in the process of continuous improvement. These methods contribute to ensuring high quality of the manufacturing process and affect its efficiency, mostly through elimination of the broadly defined waste.

Continuous production improvement was introduced into Toyota Production System – TPS and became a base for efficient, competitive, and modern management of both internal and external organisation of a company [Womack J., Jones D. (2007)]. Indispensable techniques of continuous improvement are a.o.: Value Stream Mapping - VSM, 5S (Sort, Set in order, Shine, Standardise, Sustain), SMED (Single-Minute Exchange of Die), Total Productive Maintenance - TPM that improve the efficiency of using the machinery stock, Kaizen, and others method described by Klčová, H., Šulová, D. & Sodomka, P. (2009), Metelski A., Krile S., Maruda R., Legutko S., Królczyk G.M. (2016), Sąsiadek M., Basl J. (2015), Woźniak W., Jakubowski J. (2015).

Value Stream Mapping is a technique used for mapping the process course with particular emphasis on the value of the product or service realised in this process. The product and service value is related to the needs and requirements of the client. The aim of processes mapping is to adjust their organisation so that the steps of their implementation could maximise the added-value of the product or service, and minimise the broadly defined waste as discussed by Czerska J. (2009), Sąsiadek M., Grzesik K. (2013).

This paper presents the analysis of a gear motor assembly process carried out in a real company. In the first stage of the examination the map of the present state for the analysed process was developed. It was based on the following stages: choice of a representative, stream components identification, completing of all the components of the present state map (areas: client, components completing, installation, painting and packaging, information flow). On the basis of the present state map an analysis was conducted, aiming at identification of all the potential waste elements in this map. In order to eliminate detected losses the map of the future state was developed and benefits of the proposed changes were estimated.

2. Development of the Present State Map for the Current Process

2.1. Choice of the season and representative

The season for examination was chosen basing on the analysis of shipments from 12 months' time on the most profitable post – figure 1. Three thresholds (seasons) were marked on the chart (fig.1). In an average season the weekly sale of gear motors is 68 pieces (red markers on the chart). High sale is marked green on the chart and it amounts to more than 77 pieces. The last threshold is low sale (blue markers on the chart), less than 61 pieces. The analysis of the value stream mapping of the process was conducted during the 10-week period in the late 2011/early 2012.

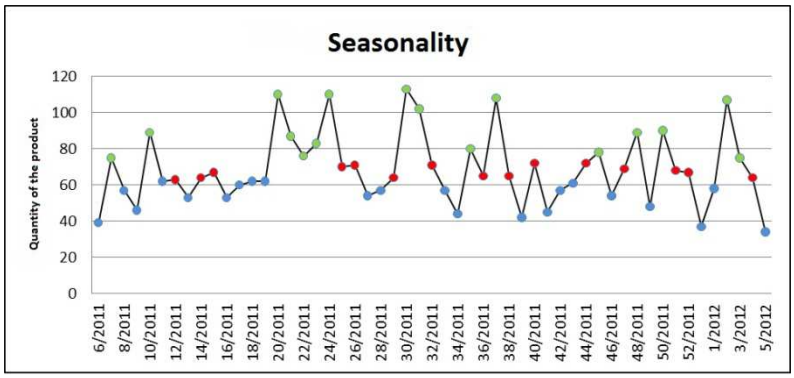

Fig. 1. Gear motors production [after Sąsiadek M., Grzesik K. (2013)]

Another element is the choice of a representative based on the number of sold gear motors assembled on the analysed post. Figure 2 presents the percentage of gear motors assembly on the selected post.

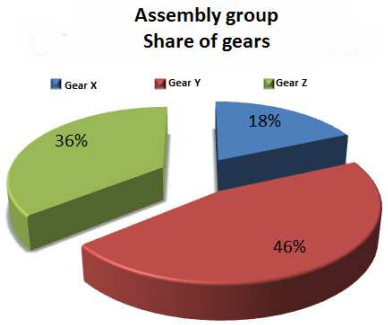

Fig. 2. Percentage of gear motors assembled on the post [after Sąsiadek M., Grzesik K. (2013)]

To map the value stream the unit Y was chosen. It constitutes about 46% (1661 pieces) of gear motors assembled on the analysed post.

2.2. Area development - Client

The first significant measure characterising relations between the Client and Company is the Average Daily Demand for the product (gear motor) – ADD. It was calculated on the basis of the analysed weeks. Apart from ADD also AWD was calculated (Average Weekly Demand), as well as the average deviation from ADD. The data is presented in table 1. All the information was obtained

from SAP program used in the company. Due to production of a few drives in one stream (on one post), the calculation was prepared for all the types.

Table 1Calculation of ADD and average deviation from ADD

Product name	*T 47*	*T 48*	*T 49*	*T 50*	*T 51*	*T 52*	*T 1*	*T 2*	*T 3*	*T 4*	*T 5*	*AWD*	*ADD*	*Average deviation from ADD*	
														[pcs]	*[%]*
unit Y	*33*	*33*	*19*	*61*	*24*	*40*	*49*	*29*	*37*	*25*	*11*	*32,82*	*6,56*	*10,20*	*32%*
unit X	*26*	*29*	*18*	*21*	*41*	*16*	*6*	*69*	*31*	*23*	*8*	*26,18*	*5,24*	*11,87*	*22%*
unit Z	*10*	*27*	*11*	*8*	*3*	*11*	*3*	*9*	*7*	*16*	*15*	*10,91*	*2,18*	*4,63*	*24%*
Weekly amount	*69*	*89*	*48*	*90*	*68*	*67*	*58*	*107*	*75*	*64*	*34*	*69,91*	*13,98*	*14,79*	*47%*

In table 1 calculations for the representative from the analysed stream were shaded. The information above indicates that the analysed demand for the gear motor Y type may fluctuate up to 32% per week.

Another crucial measure is the client's indicator. This is the desired production rhythm, which is the basis for determining standard production capacity. The client's indicator can be calculated by dividing time available per day by ADD for all the products of value stream:

Client's indicator = 55800s/13,98 piece = 3991s/piece

Therefore, the client expects that within 3991 seconds (1 hour and 6 minutes) one piece of the product leaves the manufacturing process.

Shipping, because of two markets, is carried out by several transport companies and take place every day. Shipping on the Polish market is realised by two companies. The first carrier delivers parcels below 30kg of unit weight, whereas forwarder 2 delivers larger packages put together on pallets. The Western European supply is served by forwarder 3.

Additional information necessary for the analysis is the size of the batch ordered by the client. It has been observed that even 81% of the clients orders only one piece from the whole stream. The batch size was determined on the basis of majority stake in the process of the representative's gear motors implementation, by the use of the ABC method. Therefore, the groups A and B were summed up giving the batch size of 1 - 3 pieces.

Figure 3 shows the indicators characteristic for the Client area described above. The elements of transport were marked and the size of the batches delivered to clients was defined. Time delay was described too, i.e. the time from creating one shipment to the beginning of another shipment's realisation.

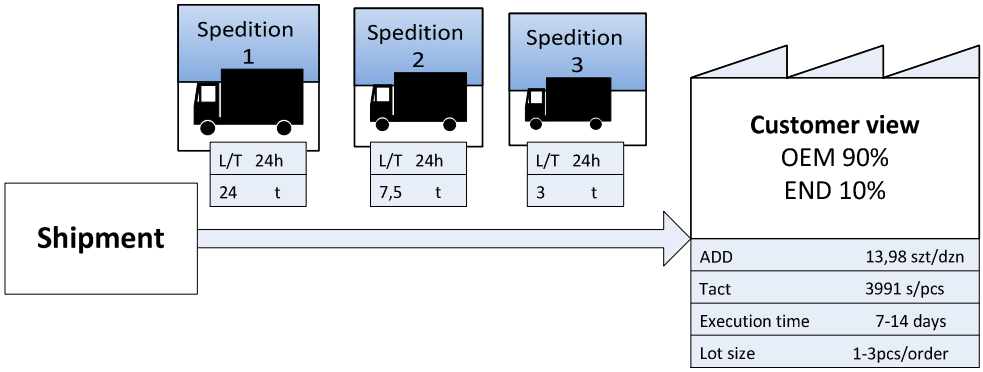

Fig. 3. Value stream map - Client area [after Sąsiadek M., Grzesik K. (2013)]

2.3. Process of completing the components

It was observed during the completing process that the most frequent batch in the process of preparing the components for the examined post is the batch made of 3 pieces. Such an amount fills the transport cart surface leaving safe space between the components. In the analysed stream the number of completed orders per year amounts to 4279 pieces, the number of completed batches amounts to 1426, product cycle time - C/T is 2400s.

C/T representative share in the whole completing C/T was calculated according to the relation: Share = (analysed stream ADD * analysed stream C/T) / (∑ streams ADD * ∑ streams C/T) and it is equal to 3,8%.

Another important indicator for the stability of completing the components process is the number of days for which the supply will cover the client's demand (DOH - Day of hands). To conduct such an analysis the type of supply was examined. The examination was based on the Bill of Materials (BOM), which was taken from the SAP system. All the parts indices used in the process of completing the analysed stream were classified into three groups: A, B, and C, by the use of Pareto-Lorenz method. It was noted that the components from group A are characterised by a frequent rotation, they go in large quantities. Group B contains indices which rotate at a constant rate in average quantities. Group C consists of materials with a rare rotation and little participation in the process. DOH was set for groups A and B basing on the ratio of the component supply with respect to the average representative ADD for the analysed stream multiplied by the number of the used component in one representative's piece. To gain estimated level for analysed groups (A and B) DOH was averaged out. DOH for group A is 11,3, whereas for group B it is 5,2.

On the basis of the calculations above and additional information obtained mostly from the SAP system the process of completing the components was characterised. The area of the process, along with its basic measures, is presented in figure 4. Transport operations from the warehouse of finished products are carried out by pushcarts and fork-lift trucks. Distance covered during one batch completing cycle is about 450m.

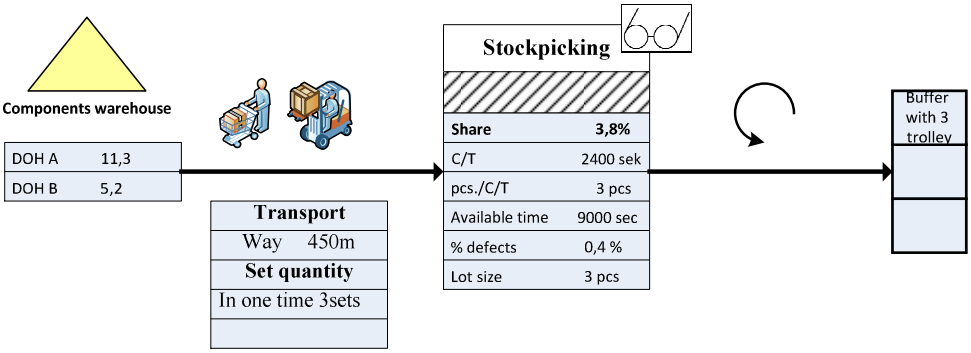

Fig. 4. Manufacturing process element - completing the components [after Sąsiadek M., Grzesik K. (2013)]

In addition, a symbol of inspection (glasses) was marked on the measures statement related to the process of completing. The inspection in the mapped process relates to comparison of the components with the material register. In the further course a buffer was marked before the assembly process in the form of intermediate storage areas (capacity is two carts filled with components).

2.4. Gear motor assembly

The map area relating to the assembly process is presented in figure 5. Additionally, information about Value Added (VA) and Not Value Added (NVA) were marked. During the gear motor assembly process the operator receiving consecutive orders applies the FIFO rule (first in first out), always having one completed cart. All the remaining parameters of this process, as shown in figure 5, were determined basing on the actual data and observations of the analysed stream.

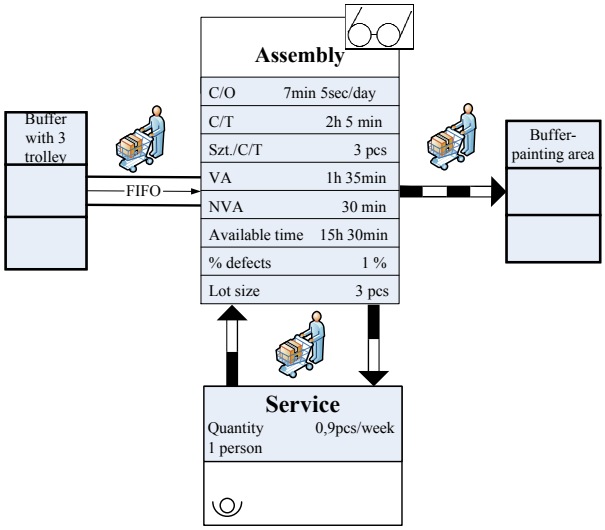

Fig.5. Manufacturing process area – Assembly [after Sąsiadek M., Grzesik K. (2013)]

Work on the analysed post is held in two shifts, five days a week. One operator works on each shift. Planned stoppages take about 30 minutes a day. As a result, available time is 15,5h. Furthermore, the following parameters were defined in the analysed process stream of the gear motor assembly: product cycle time C/T – 2h 05min, number of changeovers – 7 min. 05 s./1 day, defects percentage – 1%, batch size – 3 pieces, defects number – 0.9 piece/week. Another mark on the

following figure is the repair department, where one service engineer repairs on average 0.9 of a damaged (faulty) gear motor a week.

After assembling all the gear motors go to the buffer before another process, which is painting and packaging.

2.5. Process of painting and packaging

Paint shop/packaging area was reproduced the same way as the previous areas described above. Necessary measures characterising this subprocess and its diagram are gathered and presented in figure 6. Additional information, as in the assembly process description, is the time of Value Added (VA) and Not Value Added (NVA).

The following process parameters are depicted in the figure: analysed process participation in the analysed stream, changeover time – C/O, time of one piece flow (OPF), available time, defects percentage, posts number.

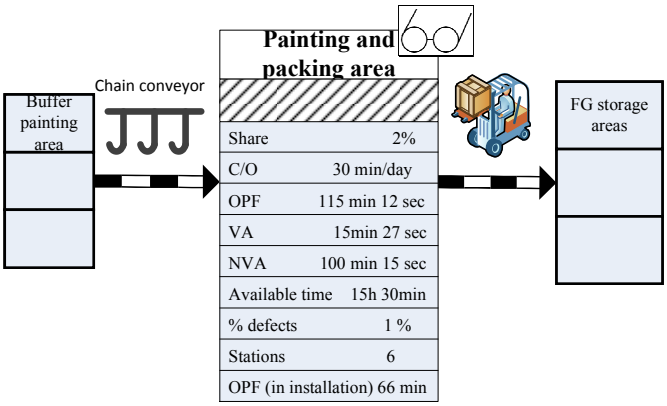

Fig. 5. Area - Paint shop and packaging [after Sąsiadek M., Grzesik K. (2013)]

The area of painting and packaging process is the last examined area of the analysed gear motor value stream.

3. Present State Map

A complete inside map of the current process state of the gear motor assembly is presented in figure 6.

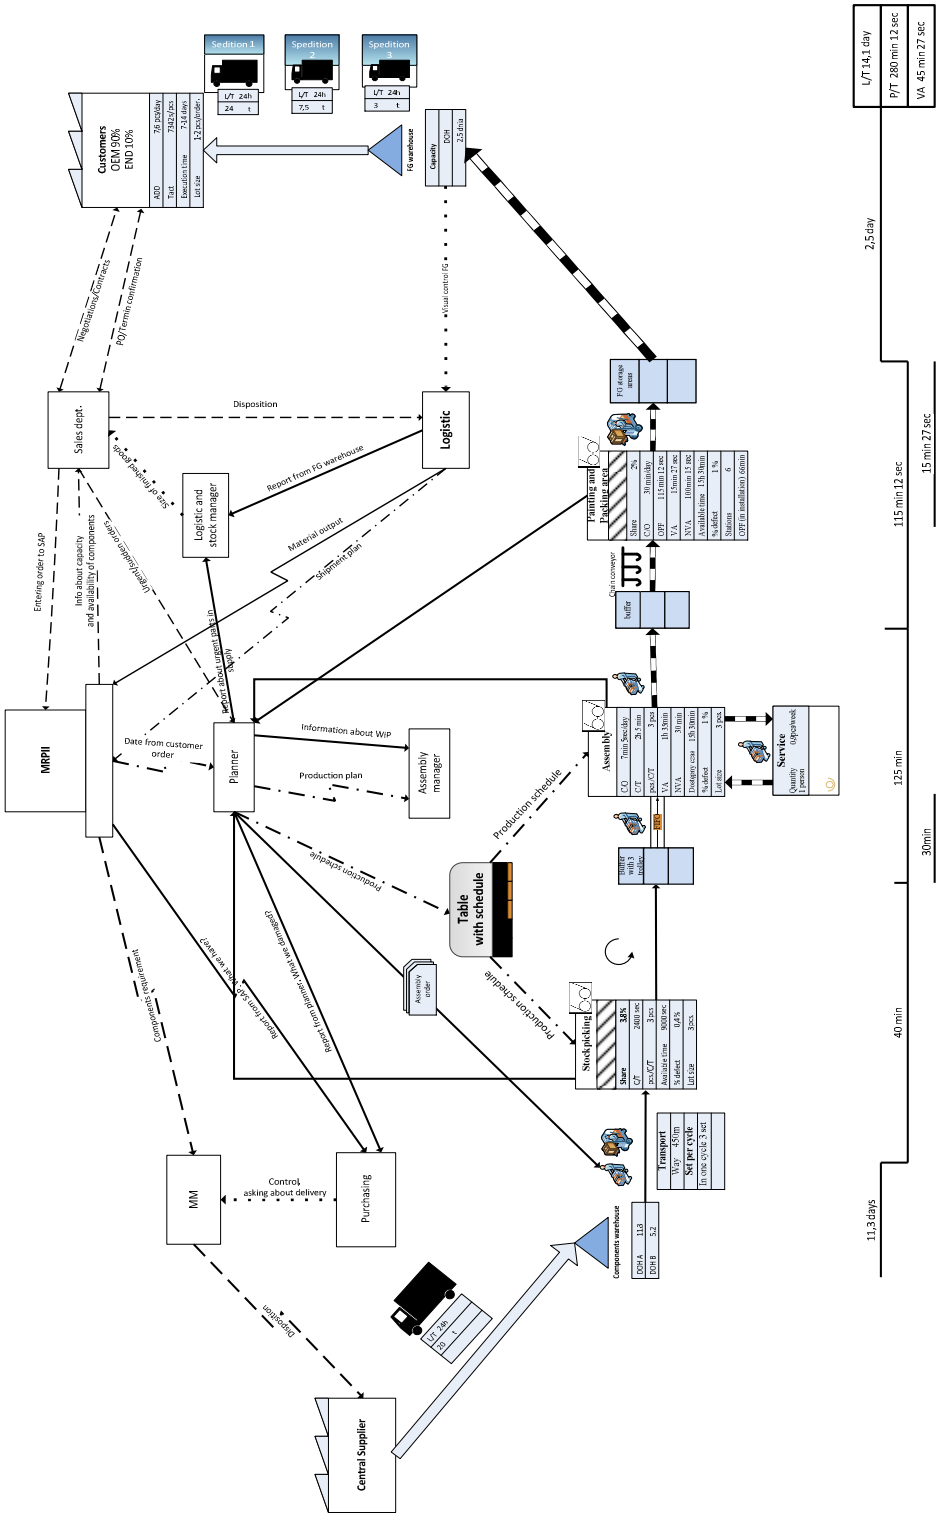

Fig. 6. Complete map of present state value stream of the gear motor assembly

After all the areas described in previous points were marked on the map, it was additionally supplemented by the flow of information between the areas and by a time line. The time line consists of three levels. The first one, marked as L/T, is the time during which the client's money is blocked

for the time of his order realisation. It is the period from the inquiry to delivery. In the discussed process it means about 13 days. The line below, marked as P/T, is the time when the product is in the manufacturing process. It has been calculated that it is about 280 minutes. The last line, characteristic of the value added, is the time devoted to the order handling, for which the client is likely (willing) to pay.

4. Proposal for the Future State Map

A proposal for the future state map is described in this section. Using the present state map of the analysed stream some of its elements were remodelled in order to improve the effectiveness of the mapped process realisation. The future state map is presented in figure 7. It was marked with changes which should improve the analysed process realisation. The elements subject to changes are marked with a red cloud with an assigned number. The proposed changes relate to the following process elements:

- Reducing the time of completing the components and shortening the covered roads by the organisation change. The forklift truck was replaced by a crane. The parts number was reduced – about 50% of the components from the Bill of Materials should be put in containers at the post (changes marked 1 and 2),
- Use of the 'kanban' system to replenish parts stored at the post (change no. 3),
- Reorganisation of the repair department consisting in equipping the department with one press (drives repaired or used in services do not return on the assembly table, at the same time blocking assembling of new gear motors) – change 4,
- Change in the method of delivering finished drives to buffer before the paint shop. So far every fitter had to deliver a finished drive to buffer – the proposal is to assign one person to all the fitters, this person would be responsible for delivering finished gear motors to the paint shop (change 5),
- Introduction of the indicator visualisation on the input and output of the painting and packaging process to smooth the whole process realisation (change 6),
- Moving the gear motors inspection operation to the buffer post before painting, as opposed to current inspection during gear motors transport in the paint shop installation. This way, if flaws are found, stoppage in the gear motors flow is eliminated (change 7),
- Improving efficiency of the process of painting and drying gear motors – one piece flow (change 8),
- Reorganisation of packaging and approving gear motors to shipment by introducing roller conveyors adjusted to easy gear motors packaging (change 9),
- Change of the method of order realisation to 'kanban' signal, that is in the 'push&pull' system. It has been noted that such a solution would facilitate control over the assembly process (change 10),
- Change in assembly planning from 8 to 3 hours forward (change 11), which can contribute to improvement in the order realisation,
- Assembly planning considering reports from the shopping department dealing with deviations from delivery time limits (change 12),
- Improvement in internal communication between the company departments (planning department vs. customer service) in terms of the order realisation status (change 13),
- Continuous monitoring of the warehouse, as well as the finished product shipping in order to minimise the stock (change 14).

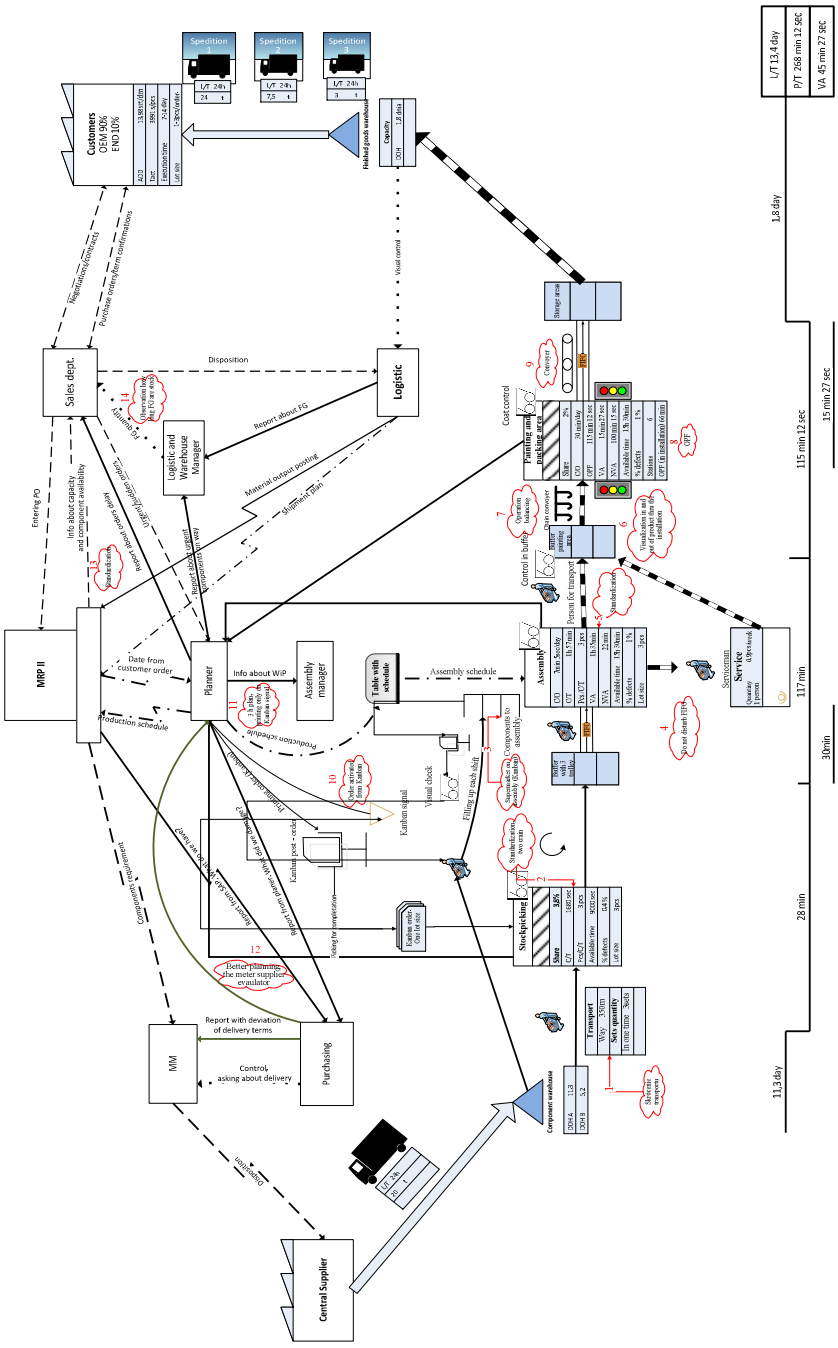

Fig. 7. Map of value stream of gear motors assembly process - future state

5. Conclusion

The paper presents particular elements of the value stream map development on the basis of the gear motor assembly process. The final effect, described in this paper, is the future state map. The issue of analysis of different kinds of processes basing on the value stream mapping is a technique applied in the whole world and giving much profit in terms of improvement in broadly defined effectiveness of the investigated processes.

The analysis of the gear motor assembly process presented in the article was directed at identification of possible changes in the materials and information flow, and in the whole process organisation. The proposed changes are being introduced in the described company. Due to long time of the changes introduction process the fact it necessitates quite significant reorganisation of the company, it was decided to improve the analysed process gradually. To do this the future process state map was developed. It should make a contribution to those changes. The analysed enterprise approved the map and preapproved it for implementation.

According to the rules of introducing this kind of processes it is a process of continuous improvement, which should cyclically aim at systematised development of the analysed process effectiveness.

Concept of Flexible Components Selection in Project Management Methodology

Katarzyna Marek-Kolodziej, Opole University of Technology, Department of Project Management, Opole, Poland, k.marek-kolodziej@po.opole.pl
Iwona Lapunka, Opole University of Technology, Department of Project Management, Opole, Poland, i.lapunka@po.opole.pl
Alfred Paszek, Opole University of Technology, Department of Knowledge Engineering, Opole, Poland, a.paszek@po.opole.pl

Abstract

The paper presents a concept of flexible components selection in large projects modular project management methodology. The methodology presented has been developed on the basis of critical chain project management (CCPM) and research conducted in production-service enterprises, which perform complex and unique large projects. Literature presents many various standards which support projects management, they however do not present a methodology with a step by step proceeding throughout planning and execution stages of a project. The elaborated module methodology consolidates a whole range of activities performed during large projects execution, at various management levels and provides new solutions in: (1) estimating the duration time of tasks, (2) time buffers size estimating, and (3) supervision of programme execution progress.

Keywords: methodology of project management, critical chain project management, projects management processes, process mapping, IDEF3.

Introduction

Enterprises which deal with large projects, very frequently have problems in maintaining projects time framework, lack of sufficient resources, deficiently structured budget, unclear goal specification, and conflicts within project team. The latest research in projects execution conducted by The Standish Group reveals that only 10% of large projects are completed successfully, 38% of them have significant difficulties, and 52% bring losses exclusively (The Standish Group, 2013). Execution of large projects within time set and maintaining the project costs at an assumed limit constitutes therefore a big challenge for contemporary enterprises in a time of transformation of any business forms.

Dynamic globalization of economy, which incited development of management sciences, and revolutionary changes in information technology causes, that enterprises management must nowadays be oriented on the market in which their business units work. This results from a necessity of defining the enterprises goals in context of market and customer demand. The global economic, political and social processes impose a necessity to rearrange (adjust) internal structures of enterprises.

Development of new information – communication technologies, reduction of mass manufacturing, development of services market, development of information technology society contributed to third, after rural and industrial, technological revolution (acc. to Toffler – the so called third wave). Third wave is a stage of knowledge and information development. It is facilitated by tremendous technological development with globalization and engagement of almost all countries in global economy. It is related with reduction of mass production and movement towards production adjusted to the requirements of individual customers. A future human being – a mansumer – links features of a manufacturer and a consumer (Dziedzic, Szymańska, 2011; Krawiec, 2009; Toffler, 2006). The overall transformations involve necessity to implement new solutions within enterprise management. One of the solutions for implementing such approach involves project management introduction in an enterprise. One of the methods of such approach execution is to conduct business activities of such enterprise as a project.

Due to increasing importance of projects in business units, the issues of their proper organization and planning become more and more important in project management. Dynamic changes in market situation cause, that commonly applied methods of planning require improvement, in view of challenges of knowledge based economy. Planning constitutes an indispensable stage of every large project. Generally, it is a creative process, which aims at specification of purpose and methods of reaching it. The process is sequential, and includes: forecasting, estimating, programming and planning. Main part of project planning constitutes programming, i.e. preparation of a programme of works, with execution deadlines of tasks, and including acceptable resources allocation (capital, staff, equipment etc.) (Trocki, 2013). Programme development constitutes an outcome of assumptions related to strategic and operative plan of a contractor, with anticipated execution constraints. Doubtlessly, risk and any uncertainty of a venture should be also taken into consideration, as well as budget and directive deadlines constraints. Programming of tasks within a venture, constitutes a complex process (PMI, 2013; Davidson, 2001; Kisielnicki, 2011; Wysocki, McGary, 2005), for which many support methods and techniques have been developed. Due to application of computer programmes, the programming process is significantly facilitated and accelerated. Research is currently still conducted on creating and improving of such programming methods, which would best reflect the actual ventures, and would fully take into consideration the assumptions made.

Due to the above fact, extensive research into planning and execution of large projects in production and services enterprises has been conducted, in view of their management. The research facilitated elaboration of module methodology of large projects, based on critical chain concept. Module structure of the methodology allows flexible selection of components during planning and execution of large projects. The paper presents construction of module methodology, its assumptions, possibilities of application of selected elements in practice.

Success as a measurable effect of large projects management

Efficient management of a large project is determined by execution of a project under certain defined parameters. This means, that requirements must be met, for project product quality, therefore it is important, at a large project planning stage, that the customer requirements are accurately specified as far as the final product (service) is concerned. A project will be efficiently executed, if the planned project budget is not overspent. A cost parameter is usually determined as the limit of expenses and cost of project execution, and the limit of main parts of a project. Time is another project execution parameter, which determines when a project is to be completed (Trocki, Grucza, Ogonek, 2003). Another parameter, decisive for project purpose reaching, is a scope, which determines what is necessary to be completed under execution of a given project. There are close links between parameters of a project, related with levelling of balance, a so called “iron triangle” (also called “magic” or “golden”). They should be considered with regard to mutual constraints and impact. Hence, assumption of a scope of project and the time of its execution requires a higher budget, whereas a shorter execution time in most cases increases the cost.

The last parameter in a project, constitute resources, which provide basis to establish programmes of activities in a project, and determine its correct execution (Wysocki, McGary, 2005). Increase of the scope of works may cause increase of the project execution cost, necessity to increase the number of resources or extension of project execution time with lack of possibility of additional resources allocation.

Enterprise which starts execution of a large project wants to reach expected result, which is to bring actual financial or non-material advantages, e.g. improvement of work organization, by implementing a new management system. A large project should therefore be planned so as to execute its main aim within a specified time, at planned cost and with required project product quality (Walczak, 2010). Literature on the subject includes consideration regarding critical success factors in projects management (Spałek, 2004), called critical success factors – CSFs. These include conditions which influence success in execution of a large project. Extent of success constitutes a relative concept. It may be perceived from the point of view of time expiry, which was noticed by J. Pinto and S. Mantel

(1990). Later the concept was developed by A. Shenhar, O. Levy, D. Dvir and A.C Maltz (2001), who proposed four measures of project success (see Fig. 1):

- project efficiency – measured by project triangle,
- project impact on a customer – with an assumption that defined project purpose could differ from intended purpose of project – this measure would measure their conformity,
- business success – this measure would measure actual impact of a result of a project on an organization,
- preparation for the future – this measure would measure conformity of project result with strategic goals of a company.

Source: own elaboration based on (Shenhar et al., 2001)

According to T. Young, the following elements influence success of a project (Young, 2007): (1) proper project goal, resources, parameters definition, (2) support and engagement on the part of the project sponsor, (3) maintaining of relations with project parties, project progress reporting, (4) properly selected project team, staff, with adequate know how and skills, (5) well prepared plan and programme of a project, proper share of tasks and duties (6) regular monitoring and control of project risk, (7) reliable and timely works progress reporting, (8) correct communication within project, (9) solving of the most important problems at the highest management level.

The most recent research of The Standish Group (The Standish Group, 2013) success of large projects depends on the following factors:

1) support of management staff – 20%,
2) competencies of project manager – 15%,
3) optimization – 15%,
4) competencies of project team – 13%,
5) specialization of project management – 12%,
6) process approach – 10%,
7) clear business goal – 6%,
8) emotional maturity – 5 %,
9) execution – 3%,
10) tools and infrastructure – 1%.

Project success, is considered to be reached in 75% by good management. According to research of The Standish Group large projects should be optimized, which may be reached by splitting a project into smaller sub projects and their management through portfolio. Concurrently, the report *The Chaos Manifesto: Think Big, Act Small* focuses on the fact, that an active participation of management of a company in projects is crucial for a success of a project, as this type of project requires engagement of significant financial expenses, and are mostly strategic projects, which are crucial for keeping the businesses work. It is at the same time important to form an efficient project team, with adequate technical, context and behavioural skills (Marek-Kolodziej, Lapunka, 2015).

It is commonly assumed, that in management of a large project it is necessary to apply appropriate methodology, in view of accepted management standard. Two different approaches are mentioned by practitioners of project management. "Traditional" (classical) approach, based on project life, identifies a sequence of steps to be taken in project management process. "Modern" (innovative) approach in turn, identifies project as a set of small tasks or knowledge domains (Wirkus et al., 2014; Pisz, Lapunka, 2015). Classical methodologies of project management include the universal standards such as PMI (PMBOK), PRINCE2, TenStep, IPMA and specialist methods, which are divided into industry and company methods. Innovative approaches to project management constitute a large group among the alternative methodological IT projects management solutions established during the last two decades. They are transferred recently most frequently to management of other types of projects. The approaches refers mainly to adaptive, agile and lean management types, towards a synthesis of project strategic framework of AgiLean PM (Demir, 2013).

Methodologies presented in literature, must be most frequently implemented as a whole, so as to bring the intended result in planning and execution of a project, which causes that they are implemented rather rarely. This may potentially have an impact on weak efficiency and effectiveness of large projects execution. It was assumed in research, that there is a need for methodological support in large projects execution and indicating deep changes in the their management methods. The most common methodologies of projects management in literature nowadays, usually constitute a collection of general guidelines, which do not provide detailed description of what should be performed at individual stages of large projects execution. They also do not include information on methodologies, techniques or tools to be applied to support a given type of a project.

Concept of modular methodology in large project management

Maturity of project management methodologies

Project maturity has recently been much focused on, being also reflected in methodologies. The higher is the level of project maturity in an enterprise, the more important are methods and methodologies of project management used in project execution. We may currently also talk about maturity of project management methodologies. The level of maturity of methodology depends on the requirements of a given enterprise, knowledge, experience and skills of project team members. We may list four levels of project management maturity (Fig. 2).

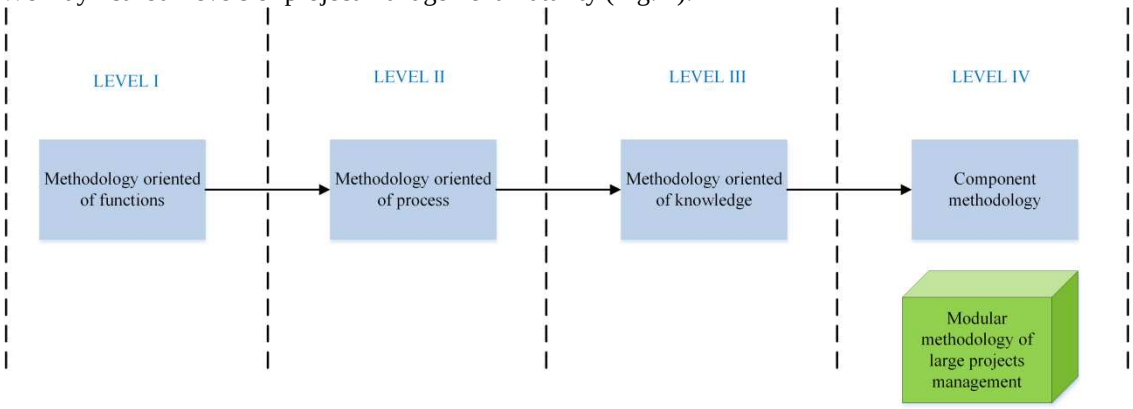

Fig. 2. Levels of project management methodology maturity
Source: own elaboration based on (http://www.sybena.pl/dojrzaloscszp.htm)

The first level of methodology maturity includes methodologies which are directed towards functions. This type of methodologies have been elaborated for project programming, and they are currently extended to time management and linked with project risk and scope management. A lot of techniques and methods have been developed within this range supporting project programming. The most popular ones are PERT and critical path method (CPM). Methodologies oriented on functions are applied in very small projects, which usually are of narrow range and short execution time.

The second level of maturity includes process oriented methods. Such methodologies describe project management domains more than function oriented ones. They support a project manager, presenting processes to be performed during project planning and execution. The most popular process oriented methodologies are the above mentioned PRINCE2 and PMBOK methodologies. These are applied in all types of projects.

Knowledge oriented methodologies are the third level of maturity. Information on individual domains of project management is crucial apart from functions and projects in project management. This type of method is developed locally (for a given enterprise or an industry), as it includes important information on the method of project management processes execution for a given enterprise (industry), for which it has been developed. Knowledge oriented methods are applied in specialized enterprises, which lead their activities on the basis of projects execution.

The last level of maturity includes component methodologies, constructed so that the project manager may select elements (components) necessary for him, e.g. scope and time management procedure, and reject the rest of procedures. This type of methods should provide project manager with a set of components, e.g. time and works management procedure, and reject remaining procedures. A well-constructed component methodology must include all elements included in methodologies presented above (i.e. function, process and knowledge oriented).

The authors' research and analysis resulted in elaborating a module methodology of large projects management, based on critical chain concept, reflecting the above mentioned character of component methodologies. The methodology includes elements of function oriented method, as it uses the critical chain concept idea, presents a method of time of activities estimating, based on a normal rate and proposes a general approach to calculation of the time buffers size, with application of fuzzy sets (Marek-Kolodziej, Lapunka, 2014). The method developed includes at the same time elements of process oriented methodologies, as individual modules include all project management processes. Apart from that fact, the methodology has been developed on the basis of research among enterprises which perform large projects in a widely understood production engineering industry, which provides it with features of knowledge oriented methodologies. Moreover, the project management process was extended by the stage of use, which frequently appears in large projects.

Construction of modular methodology of large projects management

Modular methodology of large projects management based on critical chain concept has been developed for the needs of complex, unique, strategic production and service projects. Figure 3 presents graphic presentation of module methodology, which consists of three main groups of modules: strategic, tactical and operational.

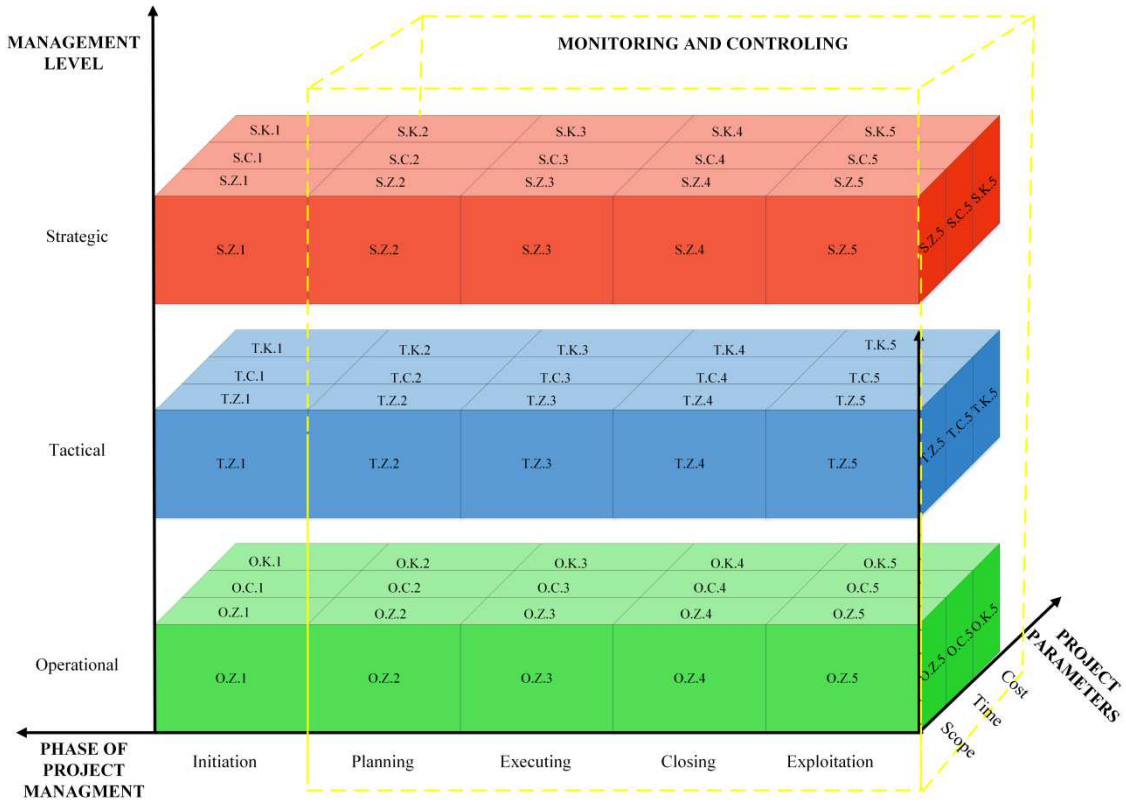

Fig. 3. Modular methodology of large projects management based on critical chain concept
Source: own elaboration

Every of the modules groups describes execution of large project management, starting from pre-project stage through planning, execution, completion to use stage. Additionally, to include all aspects of project management, three project process control modules have been established. Individual symbols marking methodology modules are as follows:

1. Management level:
   S – strategic,
   T – tactical,
   O – operational.
2. Project parameter:
   Z – scope,
   C – time,
   K – cost.
3. Phase of project management:
   1 – initiation,
   2 – planning,
   3 – executing,
   4 – closing,
   5 – exploitation.
4. Module: Management level. Project parameter. Phase of project management e.g. S.Z.1, i.e. strategic management of project scope in initiation phase.

The methodology consists jointly of 48 modules, as presented in table 1. Seven spread sheets have been developed, to support large projects management modular methodology, in order to: (1) develop project chart and determine project risk (2) estimate the NPV index value NPV, (3) estimate tasks duration times, (4) establish project budget, (5) determine time buffers value, (6) monitor buffers and (7) calculate the project work value.

Table 1: List of large projects management methodology modules

Group of module	Module
STRATEGIC	• S.Z.1 • S.C.1 • S.K.1 • S.Z.2 • S.C.2 • S.K.2 • S.Z.3 • S.C.3 • S.K.3 • S.Z.4 • S.C.4 • S.K.4 • S.Z.5 • S.C.5 • S.K.5 • Strategic management of the project control
TACTICAL	• T.Z.1 • T.C.1 • T.K.1 • T.Z.2 • T.C.2 • T.K.2 • T.Z.3 • T.C.3 • T.K.3 • T.Z.4 • T.C.4 • T.K.4 • T.Z.5 • T.C.5 • T.K.5 • Tactical management of project control
OPERATIONAL	• O.Z.1 • O.C.1 • O.K.1 • O.Z.2 • O.C.2 • O.K.2 • O.Z.3 • O.C.3 • O.K.3 • O.Z.4 • O.C.4 • O.K.4 • O.Z.5 • O.C.5 • O.K.5 • Operating management of project control

Source: own elaboration

The methodology may be applied both as a complex tool supporting project management process, using all of the modules or using only selected modules of large projects management.

Modular methodology processes mapping

Project management processes mapping is necessary for efficient project execution and planning. It is a graphic presentation of a process or a group of processes with their mutual links. It facilitates presenting in a graphic form all activities performed in a company, in order to reach certain results.

Mapping of processes is performed in two main stages. First, it should be determined what processes appear during planning and execution of projects. This involves determining (Skrzypek, Hofman, 2010):

- process goal,
- process commencement,
- process end,
- process input,
- process output,
- process suppliers,
- process recipients,
- processes measures (meters),
- process structure (processes maps, process charts, process description).

The next step is to group the processes identified. The modular methodology of large project management based on critical chain concept involves three identified groups of modules: strategic, tactical and operational.

The literature of the subject refers to many various process mapping methods. The most popular and oldest one is block diagram. Block diagram constitutes a tool used for presentation of subsequent activities in an algorithm. In form of a diagram, which presents a proceeding, system or a computer software, in form of geometrical figures linked by arrows, according to sequence of activities performer (Krok, Stempnakowski, 2008). Further method of processes mapping BPMN (*Business Process Modeling Notation*) presents graphically processes in an enterprise. The advantage of the method is possibility of mapping of all business processes, regardless of industry or organization. It is also necessary to mention BPMS (*Business Process Management System*), i.e. a group of universal modelling techniques for the needs of mapping and specification of processes (Gawin,

Marcinkowski, 2013). Apart from the methods mentioned so far, there is a family of techniques, IDEF, used for mapping of various processes in an enterprise. In the 70s, the US Defense Department developed a standard for IDEF (*Integration DEFinition Language*) process. The IDEF standard has been used as a tool for computer software development supporting production processes. Then it became a tool facilitating establishing of a map of processes in service and production enterprises. IDEF standards are used also in the so called "business engineering" including reengineering and business process reengineering.

Mapping of modular methodology processes has used the IDEF3 technique, which, due to its structure, especially use of nods, is suitable for project management processes mapping (Patalas-Maliszewska, Jakubowska, Kłos, 2015). Structure of IDEF3 facilitates understanding the method of description by persons who do not deal with processes modeling. The basic element of process diagram by IDEF3 is UOB block (*Unit of Behavior Box*), presenting a single activity (function) and „GO TO", block and „Go to". The UOB blocks are connected by means of different types of arrows. There are links as follows: (1) priority (normal arrow), (2) relation (dashed arrow) and (3) objects flow (two sided arrow). Five nods i.e. forking of a process may be distinguished in the method, such as (Stamirowski, 2005; Mayer et al., 1995): (1) all processes must commence or finish, (2) all processes must commence or complete simultaneously, (3) one or more processes must commence or finish, (4) one or more processes must commence or finish at the same time, (5) one process exactly must commence or finish.

Decomposition of UOB blocks in the IDEF3 method has been presented in figure 4. Similarly as in IDEF0 method, processes (activities) may be recorded as higher rank processes into more detailed ones, with the difference, that in case of IDEF3, there may be several mapping variants of a given UOB block. Numbers of subsequent blocks are as follows: the first number refers to mapped process, i.e. when mapping the main process, whose block has number 1, then activities for its execution or sub processes will have numbers according to UOB block, starting from 1, the second number refers to the variant of process description, the third refers to the number of UOB block.

Apart from graphic description, the IDEF3 method provides a detailed process description, according to a specific form including all necessary information about a process. The form includes the following information: (1) UOB block number, (2) process/ activity/ task name, (3) structure description, (4) constraints, and (5) process/ activity/ task description. Due to the fact, that the IDEF3 method has been used for mapping of large projects management methodology mapping based on a critical chain concept, a modified form of process description has been presented, named „Process/ activity/ task chart".

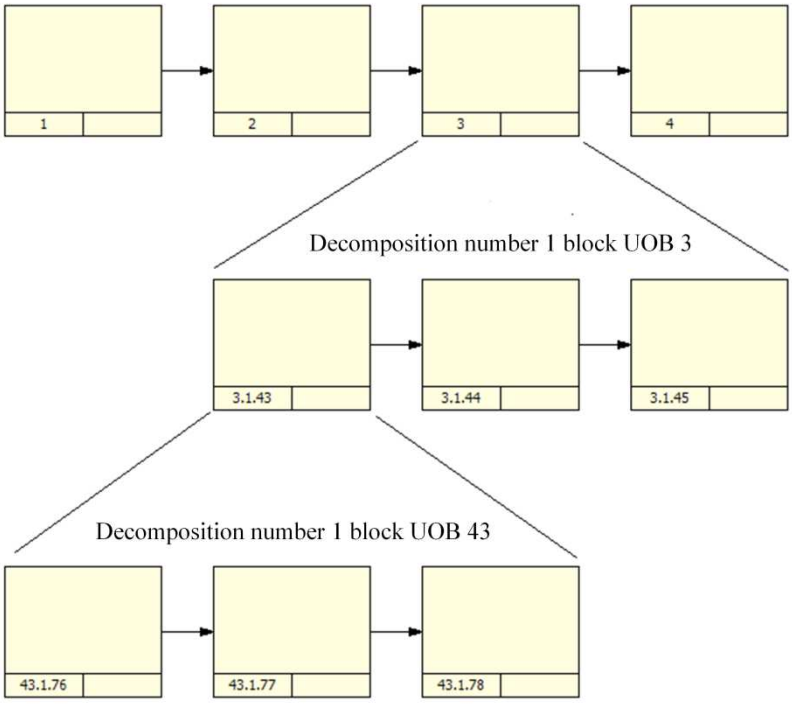

Fig. 4. IDEF3 structure decomposition

The practical possibility of using the modular methodology in managing large projects

Modular methodology of large projects management based on critical chain concept, is applied in all types of projects which may be executed in classical cascade flow of a project such as (1) investment projects, (2) production – service projects, (3) innovative projects, (4) construction projects.

The modular structure of large projects management methodology based on critical chain concept offers a possibility of its application as a whole or only of its selected elements. Project manager may select methodology modules, depending on the project type. There are several possible types of modules selection, as has been presented in table 2.

Table 2: Application of large projects management methodology modules

No.	Project type	Name of modules/ group of modules
1.	A project as a whole is executed by one enterprise. At the same time the product of the project will be used by a given enterprise.	Application of all modules of the methodology.
2.	Project is executed as a whole by one enterprise, but its product will be used by another organization.	Application of all modules of the methodology except for part of modules which refer to the project use.
3.	Project is partly executed by a company and partly subcontracted.	Depending on the part ordered to the contractor: 1. If the enterprise supervises the project – a group of strategic modules is to be applied. 2. If the enterprise supervises and manages the project tactically, i.e. supervises and manages execution of project stages or subprojects, and the rest is subcontracted – groups of strategic and tactical modules are applied.
4.	Organization is a subcontractor and executes a group of works or specific tasks.	Application of operational modules group.
5.	Organization is a subcontractor and performs a specified stage of a project or sub project.	Application of tactical and operational modules.

No.	Project type	Name of modules/ group of modules
6.	Organization has its own project management system and needs support in a specific part.	Any module may be applied separately, without implementing the whole methodology.

Source: own elaboration

Conclusion

Large projects management modular methodology based on critical chain concept includes all stages of project management. It includes pre project, planning, execution, completion and use stages. The project management levels have been extended by tactical level, which in case of large projects management appears mostly if a project is executed on an insular basis and tasks are at individual stages of a project subcontracted. Moreover, it includes a process of inspection management at each management level.

The modular methodology described, has been elaborated on the basis of critical chain concept assumptions, therefore the process of project planning execution and supervision includes the most important elements of CCPM method (Goldratt, 2009). Large projects managed according to modular methodology may due to this fact increase their efficiency as compared with today's standards of projects management. The structure of modular methodology facilitates flexible selection of elements to project manager at individual stages of large project management, which improves its implementing. Moreover, the spread sheets which have been elaborated allow an easy setting of: (1) aggressive estimates of tasks duration times, (2) projects buffers size according to triangular fuzzy numbers, (3) NPV index value, (4) project work value, (5) time buffers use during project execution.

Modular method of large products management based on the concept of critical chain concept may significantly influence efficiency of large projects management, as according to first research conducted on the application of methodology, efficiency of a given project under research has increased by 37% and effectiveness by 10%.

Microfinance a New Approach for Social and Financial Inclusion

Ph.D. Student Otilia Manta[1]

The School of Advanced Studies of the Romanian Academy

Department of Economics, Sociology and Law

Abstract

Each of us have had or go through the situation of being unable to access the credit necessary to meet unexpected expenses or trying to develop small businesses. The impossibility of accessing microfinance pushes people into poverty, increasing the number of social assistance. What makes the situation can be different, how do we prevent increasing poverty? The answer is found in the current microfinance policy directed especially to those who are financially excluded. But the access to credit as they are too expensive could also contribute to indebtedness and impoverishment of individual levels. They have serious macroeconomic consequences, as the crisis in 2007 proves. Therefore, poverty and social exclusion can be fueled by the inability to access credit and access to inappropriate forms of financing. Such difficulties are undermining economic growth and social cohesion. Instead, poverty and financial difficulties are supporting social exclusion.

Keywords: microfinance, rural credit, social inclusion, financial inclusion.

Introduction

Micro financing impact evaluation

Low-income households are most likely to be unable to access appropriate financial services. Along with poverty, age, place of residence (rural or urban) and sexual gender are direct causes of financial exclusion. Combating it is a difficult task, being both a cause and a consequence of poverty and social exclusion (Gloukoviezoff, 2010). In June 2010, the G20 summit in Toronto launched the Global Partnership for Financial Inclusion. United Nations, World Bank, International Monetary Fund and the International Labour Office have oriented their programs to issues of financial inclusion as an essential condition for creating jobs and generating revenue. Also, the European Commission, in cooperation with the European Investment Bank, have established numerous programs such as "Jasmine" and "Progress" to support microfinance institutions and for employment and social inclusion. More recently, in the Europe 2020 strategy for smart, sustainable and inclusive growth adopted in 2010, the European Commission asked Member States, among other recommendations, the need to "develop concrete strategies for social innovation, such as public-private partnerships ensuring adequate and predictable financial support, including microfinance "(European Commission, 2013, p. 12). It would thus achieve the goal of raising at least 20 million people out of poverty and social exclusion, and improve employment of the population aged 20-64 years to 75%. Therefore, microfinance is facing real challenges in order to contribute to the realization of the 2020 Strategy. Will it be able to provide

[1] Manta P. Elena Otilia, email: otilia.manta@ince.ro;otilia.manta@rgic.ro

the expected impact in terms of financial and social inclusion? Impact evaluation of microfinance requires awareness that "microfinance" is a generic term for a wide variety of products and services. It covers areas such as micro-credit, micro-economics, micro-guarantee and micro-insurance while in each of these subcategories services provided differ in their characteristics, cost, target audience and the institutional context in which they occur. The impact of microfinance service provider is only one aspect of its social performance. The concept of social performance involves consideration of factors such as:

- purpose and goals of an organization;
- its inputs (resources and procedures);
- results;
- its impact.

The social performance analysis of microfinance service providers involves understanding and assessment of inputs from suppliers and their efficiency in order to achieve the purpose and objectives initially set (Lapenu and Reboul, 2006).

The social performance evaluations have two complementary objectives: providing an understanding of the processes implemented to promote their improvement where necessary and to demonstrate the effectiveness of action by measuring the change impacts of main supplier to customers (Lapenu and Reboul, 2006). In this regard, the impact evaluation of microfinance service providers is not only a way to ensure ongoing funding, but a tool to help the organization to learn and perform better by designing products and processes that proves more suitable for both,customers and suppliers (Copestake and Williams, 2011; Karlan and Goldberg, 2011; Copestake, 2014; GECES 2014).

Improving the impact of organizations can be done by collecting data internally on a regular and reliable, but not necessarily, in a "scientific manner". What matters is that the results are meaningful and credible assessment in order to take the relevant decisions. To prove the impact of an organization requires a methodology that not only meets domestic needs, but also have an external standard of credibility.

This "change" in the methodology of implementation was also supported by two factors. The first is that foreign donors were often more interested in evidence of the impact of their financial support for microfinance organizations rather than to contribute to the learning process and improve it (Bédécarrat et al, 2012 ;. Naudet et al ,. 2012; Copestake, 2014). The second factor is that most of the information needed to assess the social performance of an organization are easily accessible internally while impact assessment requires the collection of information by engaging discussions with potential customers and non-customers (ie, counterfactual). Data collection is a particularly difficult task for staff is not ready for such research tasks.

Research Methods and Techniques

Regarding the methodology of research on microfinance, cthe omplexity and diversity of the issues addressed have required the use of methods, techniques, tools and procedures of scientific investigation and interpretation, in which we placed particular importance to:
- documentation, namely accessing and studying general and specialized bibliography, domestic and foreign, state approach to knowledge issues investigated rural microfinance and scientific substantiation of the research;
- Rational method, used as an instrument of knowledge, reflection, analysis, organization and ongoing scientific research approach;

- The integration method of forms, methods and logic operations research carried out through the use of analysis and synthesis, abstraction and concretization, comparison, generalization and systematization;
- The statistical method through the use of descriptive statistics and statistical analysis;
- Method of observation, conducted systematically and analytically;
- Discussions with experts from within national and international institutions, but also the beneficiaries of microfinance products and services;
- Data analysis and interpretation, using graphs, charts and figures to highlight various developments in microfinance.

Using the classic instruments of scientific research, based on analysis and synthesis, induction and deduction, general and particular and adding modern methods, we achieved substantial and pertinent analyzes and studies on rural microfinance main ways both, internationally and especially national. Personal contributions are highlighted, within each chapter, and the significance of theoretical and applicative value resulting from the conclusions and proposals we have formulated and promoted.Also, results of research were disseminated during 2015 onnational and international scientific conferences and through publication in scientific journals, as author. The research results are presented using tables, figures and graphs. The theoretical information needed for the research were taken from literature and specialized works (books, studies, papers, articles etc) in the field of microfinance from home and abroad. Statistical information and concrete data on microfinance opportunities were taken from reports and statistics of institutes involved in microfinance in the country and abroad,as well as to public bodies and private specialist. Rural microfinance opportunities is a research topic of great interest worldwide in the present economic environment generated by the global economic crisis. The construction of microfinance theories aims to establish correlations between the values of the entities funded (firm, etc.), financial structure and the cost of capital procurement. Although some argue that theories developed microfinance optimal structure has a positive effect on the market value of the financed entity, there are theories that claim the elaborate financial structure has a neutral effect on it. In this regard, in this paper, is highlighted the relevance of theories on evolution and structure of the microfinance optimal legal entity (eg farm), respectively:

- Classical or traditional theory; the theory of compromise; agent theory; signal theory; hierarchical theory of microfinance; modern theory on capital structure.

If, theoretically it is possible to achieve an optimal structure of microfinance, in practice we consider that this objective is difficult to achieve, due to problems of quantifying the different variables which the decision of microfinance on medium and long term face it. However, the theories presented on the optimal structure of micro entrepreneurs in rural areas offers some important lessons.

First **-** these theories argue the opportunity to identify the factors that influence the capital structure and, on this basis, the developing decision-target structure. Capital structure target may be a range of borrowing rates that change over time while generating conditions change.

Secondly **-** Entrepreneurs should have as an objective a specific capital structure compatible with the overall strategy of the financed entity (eg farm) on earnings growth, market position etc, and decisions of microfinance should be developed based on this structure.

In the third line **-** Establish a microfinance optimal structure is a complex process involving a combination of quantitative analysis with value judgments characteristic of each enterprise management areas.

The issue of microfinance company cannot be investigated scientifically without an adequate approach to the concept of cost of capital as the main variable information integration market microfinance among those who make capital available (investors) and those who need them (

entrepreneurs and companies). Nowhere there are, in fact, free microfinance resources, which is why a good knowledge by contractors, the cost of capital is a necessity (Levasseur, M., Quintart, A., 1992).For example, the package of financial services available to small farmers in developing countries is severely limited, especially for those who are living in remote areas without access to basic infrastructure market.When poor people have limited options for saving or lending,their investment plans are stifled and so it is harder for them to get out of poverty. If households do not have access to insurance and are unable to accumulate small savings, enabling them to pay household expenses and business, especially during seasons of poor harvest, they are forced to limit their exposure to risk, even if they expect big profits. Again, this makes the path out of poverty more difficult than necessary. Inadequate access to financial services is therefore a part of what is often called by economists "poverty trap".

The microfinance system, nationally or internationally, offers to the companies in rural areas a limited range of solutions for microfinance, which is why my approach is linked to choices made between resources of microfinance accessible internationally and the ways of combining them. These are two aspects of microfinance fundamental policy. In the taking decisions micro financing, rural entrepreneurs must have rigorous criteria allowing choosing and combining these resources. Undoubtedly, the cost of microfinance is the main criterion in choosing microfinance resources.

Without knowing this cost cannot be obtained the company's market value maximization in rural areas. Also, a correct estimation of cost of capital is important in the process of adopting investment decisions by legal entity in rural areas (eg farm).

Microcredit, as defined by by the EC, is under € 25,000 loan given to support the development of microenterprises and self-employability. It has a double impact: the economic one, as a means of creating income generating activities and social one, as a means of social inlcuziune and therefore financial inclusion.

91.8% of businesses in the EU are micro level, comprising over 2/3 of the workforce. Micro and small enterprises are the engine of the European economy. However, creation and development of micro businesses in Europe is a cumbersome process. People from disadvantaged groups such as long-term unemployed, economically inactive young people, single parents (usually women), immigrants, the elderly (seniors) or disabled face difficulties for starting a small business or become self-employed (self-employed). In addition to administrative barriers, another major problem for them is access to finance. Commercial banks are reluctant to grant small loans because the administration costs are large while the profit margins are small. This discourages banks to provide loans under € 25,000. Also, the self-employed and micro-entrepreneurs are considered too risky by banks, using the scoring method based on credit history and provide safeguards for securing the loan. Most times people from disadvantaged groups have no collateral and no business track record. Moreover, the financial crisis and economic downturn became more expensive for financing debts and the wave of regulations (especially Basel II reform) have made more difficult the access to financing. Banks are gradually retiring from local and mutual economy as a result of increasingly stringent banking regulations. Therefore, the EU has made a priority of small and micro enterprises, through its internal policies, regional and employment. Europe 2020 Strtaegy with***2008 Small Business Act***aims to improve regulation and access to finance for small firms by Single Market Act and the new Structural Funds programs. Microcrediting is operational by 2007 JASMINE technical assistance program followed the European Progress Microfinance Facility 2009, providing 200 million euro to European microfinance institutions in the form of loans, guarantees and equity. A global definition presents the microfinance as providing basic financial services to low-income peoplewho traditionally have lack access to banking services definition (CGAP), including: credit, micro-savings, micro-insurance and microleasing. In EU the focus is on microcrediting, defined as loans under € 25,000 which addressed to two groups:

- Microentrprise, defined as companies with fewer than 10 employees;
- Disadvantaged persons (unemployed and other inactive persons, social assistance, immigrants, etc.) who wish to become self- employed but don'thave access to traditional banking services.

Thus, a distinction is made between micro lending and inclusive lending. The crediting of microenterprises is targeting the clients almost bankables (start-ups or existing companies) by amounts close to the maximum limit of 25,000 euros.On the contrast, the inclusive crediting is targeting the non-bankable clients, people who most likely will remain excluded from the banking system in the medium and long term. In fact, the unemployed and economically inactive people who want to take the first step in winning an independent income often seek loans under 5,000. So, there are those people who want to make the transition with small financial steps from the informal economy or jobs with small income to self-employment. Since the cost of administering of small loans is high and target groups often need additional counseling and support services for their businesses, the european microfinance programs are hardly sustainable, requiring government support. Even itself the microcredit operations that could be financially sustainable requires pre- and post-counseling subsidizing lending.

Entrepreneurship and self-employment are activation instruments of the labor market. Many people, especially the ESF target groups (unemployed, immigrants, women, people over 50 years, youth) are hard to find a job, but could be very good entrepreneurs. Helping them to start a business or conversion into self-employed, in addition to reducing unemployment period is a way to develop creativity and innovative potential of a person who generates a sense of trust and usefulness. Well-designed, the entrepreneurship policies improves the economic and social inclusion.

Lending of micro-enterprise versusthe social inclusive crediting

Definition of European Commission Recommendation 2003/361 / EC of 6 May 2003: "A micro-enterprise is any enterprise with fewer than 10 employees and a turnover under 2 million euro." Lending the micro-enterprise target the top level of the microfinancing market, by providing loans for bankable or nearly bankable microenterprises. The inclusive social lending are turning to self-employed individuals without access to banking services because of their economic and social status. These accesses loans in significantly lower. These two types of Micro financing are not mutually exclusive.

About 63% of European organizations can be classified as "social inclusion lenders". Their work includes promoting business start-ups, job creation, social support for persons excluded,reduce poverty.

The SROI indicator

Social Return on Investment (SROI), the indicator for entrepreneurship and microfinance programs shows that the amount of public funds granted for the scheme is part of the amounts saved in terms of social benefits which have not been granted those persons, as they became self - angajate or have found employment through microfinance program in question. Such assessments show the economic and social usefulness of microfinance schemes. SROI analysis is a process of understanding, measuring and reporting the value of social, economic and environmental created in an organization. SROI shows how is translated the social and environmental results in tangible monetary value, supporting organizations and investors to see the full picture of the benefits of spending their time, money and other resources. This investment can be further seen in terms of value created for individuals, communities, society and the environment.

SROIindicator allows a comparison of the value generated by intervention and investment required to achieve that impact.

SROI = *net present value of benefits / net present value of the investment*

Microfinance in Europe

At european level there are different models of microcrediting,sector which began to develop in 2000 in the western part and in the 1990s in the central and eastern. In the western part of Europe because of strict regulatory framework that allows banks to grant credit only prevail the linkage model:support organizations accompany clients and cooperate with banks for pulling credit. Although the linkage model often generateslonger procedures for granting and firing longer, has some clear advantages: while banks obtain specific information oncustomer segment and may outsource part of certain operating costs, the nonprofit organisations support the target group with a broad of products alongside with learning the techniques of scoring and evaluation of bank customers. In the countries from Central and Eastern Europe, the microfinance operations began in the 90s as a private initiative supported by international donors. In Romania and Bulgaria the microfinance organizations have a specific status of non-bank financial intermediaries and have the right to lend. Credit unions provide microfinance, savings and insurance. In the UK, the community development financial institutions (CDFIs) credits small businesses and individuals from disadvantaged areas. Types of microcrediting organizations in Europe:

- Non-governmental organizations specialized in microfinance (integrated non-financial services);
- Microcredit banks (converted from non-governmental organizations and foundations);
- Non-governmental organizations focused on specific groups (acts at small scale);
- Credit cooperatives (with special legal status);
- Non-banking financial institutions (microfinance institutions);
- Institutional support programs (part of the existing programs of development banks);
- Community development financial institution (CDFI - UK only).

The European Microfinance market is heterogeneous, immature and fragmented. There is not a common business model. The microloans value ranges between 220 - 30.000 euro, the largest being granted by banks, non-banking institutions and government organizations. The most pressing problem of such institutions is the lacklong-term funding sources. It is however noted a trend of professionalization, efficient and self-sustaining. A growing number of unemployed people represents a source of demand for microcredits. Anyway, without access to stable funding, the growth perspectives are limited. It is expected that during the next period,european commercial banks to further reduce lending for financially excluded people, small and micro start-up entreprise. Microfinance is an important tool to combat the financial crisis and to sustain an inclusive growth. The legal framework for microfinance in Romania exists since 1993, currently being over-legalized. The romanian microfinance sector is competitive, being the 5th largest in the European Union with experience in accessing decentralized programs. On the other hand, in Romania there is no coordination between training programs in entrepreneurship and access to microfinance programs.

beneficiaries They are micro-businesses, including freelancers, sole proprietorships, family associations, small, new companies (start-up) companies, innovative entreprises,farmers.

institutions involved are: donors (EU, European Investment Fund), the fund manager, non-bank financial institutions, experts, consulting firms, microfinance institutions, guarantee funds.

The benefits of the activity of microfinance for Romania mainly consist of: improving access to finance for all recipients listed above, improving the quality of financial services and support for business development offered by participating institutions, SME development and the creation / maintenance of jobs, revenue growth business of the beneficiary companies, while increasing the value of micro-credits granted. Thus, microcredit can be a breeding ground for the interbank market to creditworthy customers.

The financing deficit of viable agricultural holdings in Romania (127.107) and viable enterprises in processing and marketing (4293 companies) come, under MARD estimates, the value of RON 9.343 million, respectively EUR 2.088 million for agricultural businesses. Financing gap in terms of viable non-agricultural SMEs in rural areas amounts to a total of 1.235 million RON equivalent of EUR 276 million.

***Table* Estimate the funding gap in Romania**

Indicator section	Number of viable companies concerned	The average loan amount (EUR)	Deficit financing (% companies)	Deficit financing (nr.companies)	Deficit financing (EUR)
Agriculture	131 400	67.429	23.6%	30.966	2,088,021,922
Nonagricultural sectors from rural area	20.742	113 980	11.7%	2.422	276 020 842
	152 142				2,364,042,764

Source: NBR, NTC, Eurostat, own calculations

Total cumulated deficit financing is about 10.578 million RON equivalent of EUR 2.364 million.

In the context of my personal desire to create economic models for financial and social inclusion of romanian rural area and in sync with the current funding program for agriculture and rural development (NRDP) in conjunction with other funding programs (such as COSME, Progress, European Social Fund - Operational Programme Human Capital, etc.), I believe that through a careful thinking and in accordance with the realities of Romanian rural space can be created microfinance business models to ensure sustainable development of SMEs. I confess that personal concerns related on issues of financial and social inclusion of SMEs in rural areas, especially small farmers, dating from the time when I started to develop some investments and support services in rural areas.

In most cases, potential investors and farmers were connected to the system of market economyonly by small European and/or nationalsubsidies granted per areaor per animal. The demand for loans were and still are today for more than 93% of the rural population. Faced with this situation, we concluded that the only way to connect villages to the circuit of market economy is the creation and generalization of specialized micro patterns or to provide to the rural households access to financial resources, especially through microfinance institutions. The impetus came mainly from rural microcredit models from developed countries, especially in emerging concerns at the highest governmental and international institutions. Encouraging is the factthat Romania currently has already taken clear and concrete action to support the approximately 830,000 smallholders. But there is always more to be done:

- Support and revive of small-scale farming requires a comprehensive platform of political and developmental initiatives that are tailored to the unique needs of farmers and family farms;
- To keep long tradition of family farming there are necessary friendly policies and regulations for the environment;
- Improving access to land, water, markets and credit - as well as legislation on the ownership and use of standardized land - creates a solid foundation for productivity, solid ground on which farmers can and will invest in the future of their farms;
- Public investment in rural infrastructure, public services, training and education can give to small farmers the support they need to be competitive in a market increasingly globalized;
- Encourage women and youth to participate in agriculture will guarantee a long-term viability of family farming.

Starting from the "main priorities and measures for development of the regions selected from the respective Regional Development strategies, integrated with priority objectives and appropriate measures contained in the National Development Plan" and linking with the microfinance measures in the context of the current European economy, I believe that the theme proposed by the research conducted within its frameworkto help the development ofa model to support the microfinance in rural Romanian. Global measures taken by world leaders at the Summit in Seoul, November 11 to 12, 2010, namely those on balanced growth with direct impact and corporate social responsibility, makes us to say that increasingly more world leaders are concerned with creating models on financial and social inclusion of the poor. Also in this summit were discussed issues related to the reform of international financial institutions, strengthening global financial safety mechanisms and, in a separate session the new G20 agenda on development. Starting from the European model of nonprofit organizations (in our case the Business Development Association - BDA) involved in supporting directly and indirectly of microfinance in countryside and through the Romanian Group for Investments and Consultancy (RGIC) IFN SA - a non-bank financial institutions authorized by the National Bank of Romania as microcredit provider, I believe that we can achieve functional economic models of microfinance for the actors involved in the sustainable development of Romanian rural area. One model was the one proposed in this article. The realization and establishment of this project are based on studies and scientific works of the most awarded personalities in Romania, whose work examines with great probity fundamental issues of sustainable development in rural Romanian. I will announce some of these studies and themes: Romania's national agricultural project, after two and a half decades of “reform, restructuring and adjustments"; The main challenges of the countryside; Performance restrictive factors of Romanian agri-food economy: the disintegration of the agro-food failures between agricultural production and food processing, agro-food chains improprieties in the operation, subsistence and semi-subsistence farms domination, promoting forms of financial support that stimulate productive performance; Developments in post-revolutionary agrarian structure; Design error in placing agriculture on the market economy principles; The characteristics and the current structure of rural areas; Government policies for agricultural financing;

Sooner or later, Romanian financial system will be required to align the practices of microfinance in countries with developed agriculture. First, to those used in European Community countries, but also in those areas of the world where agriculture has experienced a spectacular development, especially from the implementation of funding schemes and accessible credit to all farmers, such as in our case the National Plan for Rural Development. It should make the mention that microfinance is not a new for nowadays, this is present on Romanian market since the interwar period. Groups and microfinance institutions have a historical past, being established at the beginning to provide services to people who did not have access to commercial banks. The reconstruction of this system of microfinance in Romania today, a first inspiration could come

from microfinance models practiced over the years in the Romanian countryside. After a period of searching and calling some improvisations, I believe that we are at the stage where we are obliged to approach the decisions leading to the reestablishment of new principles of institutions to provide lending to local actors and sectors vital to the economic consolidation of settlements and welfare. It is the establishment of banking institutions to finance economic entities with legal personality: banks, in rural areas, where crediting legal entities and individuals active: banks to finance exclusively educational or health institutions in rural areas. Capital required to set up such institutions should be ensured through government financial contributions for which payment to be repaid in time. In this action may be involved and the 25 commercial banks operating in Romania and also the food companies that are involved in lending. To achieve this goal the establishment of a national rural microfinance should be started from what was good in the rural credit system in Romania in the interwar period, especially from existing models today in some countries of the European Union.

CGAP estimates that the world is over 500 million family farms, farms that provide food to more than 2.5 billion people, people who live daily with less than 2 $. I consider it is our duty, as economists, to identify the most efficient models of microfinance and to support those people who are in an absolute or relative degree of poverty. The constraints of those who are working in microfinance for rural areas are numerous,risks and limitations are as collateral, especially if we consider that vulnerable segment in bankable terms. However, we are witnessing now a tren in many debates that make us say that increasingly many factors turn their attention to financial and social inclusion of rural areas.

The specialized micro finance development in rural is thepillar of support for small businesses, improving their sustainability and rural real life. A major percentage of rural households shows that they lack access to sustainable and affordable financing for agriculture and other livelihood activities. Many small farmers living in remote areas, where the retail banking is limited or not aavailable and production risks are high. The recent financial crisis has made the granting of loans to become even stricter and the need to explore innovative approaches to rural finance and agriculture has become even more urgent. The progress of financial inclusion is the result of digitization trend of the financial sector, with a major impact on financial institutions. Creating new distribution models (networks of external agents, banks with branch network), the emergence of new opportunities for customer access and management of back-office are just some of the challenges microfinance sector has passed through innovation and adaptation continue.

The phenomenon of "microfinance" has created new opportunities for customers: easy management of household savings, revenue collection, payment of bills and taxes. Using it still must become more concrete and consistent in Romania, and customers should be educated to master these new digital tools. It is undeniable that a revolution is taking place! In the context of the financial crisis, microfinance continues to grow, offering new opportunities digital form be it access to new customers or help and services provided to beneficiaries.

Rural areas, as reported by the EU Rural Review, are estimated to generate 48% of the gross value of the EU economy and 56% of total employment in the Member States. A typical characteristic of the rural economy is the presence of small and medium enterprises (SMEs), many of which are micro-enterprises with a high percentage of self-employment jobs. Innovations in rural and agricultural microfinance have significant potential to improve the livelihoods and food security of the poor. Although microfinance has been studied extensively, there is a big gap of knowledge, especially regarding the possibility of expanding access to rural and agricultural microfinance.

The 2020 Vision 2020 initiative of International Food Research Institute (IFPRI) from World Bank was to conceptualize and assemble the concept of microfinance rural and agricultural to bridge the gap of knowledge by promoting innovation in the provision of financial services for

rural households and creating innovative tools to effectively manage the risks facing the rural poor. The importance of the realities of rural areas facing small farmers, including low education levels (according to statistics provided by the National Institute of Statistics) and the lack of access to modern financial instruments according to size and their requirements, lead us to claim that currently dominant subsistence agriculture (in Romania, currently, there are about 2.5 million farms semisubzitenţa according to statistics). These conditions mean that we, those involved in developing new models for microfinance institutions must create new and innovative badly needed to be closer to the funding needs for small farmers. Existing communication technologies offer us new opportunities for rural microfinance by reducing business costs. The new microfinance facilities have great potential to address the risks faced by small farmers. In addition, the combination of financial services with non-financial services such as technical support services, marketing and financial consulting offers new opportunities for small farmers to increase their productivity and income, and the integration of its production in the complete value chains. Finally, from the micro level at the macro level, it is necessary to create an enabling environment for the development of policies and a legal framework for the implementation of rules and regulations, European and international also, rural infrastructure and support contributes greatly to sustainable access to rural microfinance reality. Mead office in which we live and in which things move fast, do so innovations in microfinance Rural contribute to policy changes that improve access of poor people to financial services and, consequently, in îmbunătăţierea living conditions in household areas (family farms).

International Food Policy Research Institute (IFPRI) supported by the Consultative Group on International Agricultural Research (CGIAR) is one of the most dynamic international research innovation. "2020 Vision for Food, Agriculture and Environment" is an initiative of IFPRI to develop a common vision and a consensus for action on how to meet the needs of future food, poverty reduction and environmental protection.

Around the world, farmers are also small entrepreneurs, traders, investors and consumers. In all these roles, small farms are constantly looking to use the financial instruments available to improve productivity and ensure the best choices on consumption and investment needs for their families. But the package of financial services available to small farmers in developing countries is severely limited, especially for those living in remote areas without access to basic infrastructure market. When poor people have limited options for saving or lending their investment plans are stifled and so it is harder for them to get out of poverty. If households do not have access to insurance and are unable to accumulate small savings, enabling them to pay household expenses and business, especially during seasons of poor harvest, they are forced to limit their exposure to risk, even if they expect big profits. Again, this makes the path out of poverty more difficult than necessary. Inadequate access to financial services is therefore a part of what is often called by economists "poverty trap".

We are currently witnessing in the increasingly concerns UN member states on sustainable development goals (Sustainable Development Goals) targets that are a series of targets that states will use to realize policy the next 14 years. Given that currently the global witnessing increasing poverty, unlike the objectives set out in Agenda 2015 (in which I included the development goals of the millennium) the wealthiest involved for those in need (disadvantaged) under Agenda 2030 is major involvement of the state, each state is hazel rings collectivity present generation and the generations following. Based on research published by Global Goals, the concept of sustainable economic development with environmental protection and social inclusion. Agreed after an extensive public consultation process that lasted three years, the 17 sustainable development goals include six areas: dignity, people, prosperity, planet, justice, partnership and principle: to "not let anyone ago ", all combined under study will give us the answer to how we want to show the world 2030?

1. ***eradicating poverty***: Global target of "0" persons living with an income lower than $ 1.25 / day in Romania 18.2% of people living in persistent poverty in 2012, and according to data from the National Statistics Institute, in 2015 the number the poor rose to 5.6 million people.
2. ***hunger***: The global target is to reduce hunger threshold to 0%; Romania has made progress in the 1990s, the percentage of the population undernourished 2% to 0% in 2007.
3. ***Health & Welfare***: The global target is to reduce neonatal and infant mortality (less than 12 cases per 1,000 live births respectively less than 25 cases per 1,000 live births). Romania in 2012 - every 1,000 children under 5 years there have been 12 deaths.
4. ***Education and quality***: Global target - reduced to 0% dropout rate and combat all forms of differentiation that impede access to education. In Romania in 2014, 18.1% of students left school (26th of 28 EU countries).
5. ***Gender equality***: Global target of eradicating all forms of gender discrimination; Romania ranks 70 out of 136 countries in gender gap index, with a score of 0.691 (1 = tie).
6. ***Drinking water and sanitation***: Overall goal: universal access and reasonable facility systems drinking water and sanitation. In Romania only 62.4% of the Romanian had access in 2014 to the public water supply, while in rural areas the figure drops to 25%.
7. ***Renewable energy accessible***: Global target - substantially increasing the share of renewable energy in total energy consumption. Romania: 41% of energy produced in 2013 was from renewable sources.
8. ***Growth & Decent Work***: Overall goal: achieving full productivity in work for everyone, with special attention to young people and people with disabilities, based on valuation and revenues equal.
9. ***Industry, Innovation and infrastructure***: -the Development of infrastructure through global target prices affordable and equitable services for all. Romania: 20% of all enterprises have introduced innovative policies in their work.
10. ***reducing inequalities***: Overall goal - promoting social inclusion, economic and political of all, regardless of age, sex, disability, race, religion or economic status. In Romania • the level of the average EU income inequality index was exceeded in 11 states, including Romania since 2009.
11. ***Communities and sustainable cities***: Global target - access for all too decent housing and basic services, affordable. In Romania - 7% municipal waste recycling rate in 2011 (compared to 0.29% in 2003).
12. ***Sustainable Production and Consumption***: Global target - a framework for a minimum of 10 years for sustainable development (production vs. consumption). Romania: take the trash annually 2.2 million tons of food, ie 10% of the food we buy.
13. ***Combating climate change***: Global target - strengthening resilience and ability of countries to cope with climate change risks. In Romania - the fine particles is 14.85% mg / cubic meter (value similar to that of the region) in 2012.
14. ***Protection of aquatic life***: The global target is to reduce and prevent water pollution. Romania: there were 56 water pollution accidents in 2014, including 27 petroleum products.
15. ***Protection of terrestrial life***: Sustainable forest -management global target, combating land degradation and biodiversity loss. Romania: 27 counties are classified as risk areas, including the area code red 21 illegal deforestation.
16. ***Peace, justice and strong institutions***: Global target - to ensure coverage of 100% of people with identity documents, including birth certificates.
17. ***Partnerships goals***: Global target - cooperation at macro and micro level to achieve objectives.

All these sustainable development goals are identified by the team "Global Goals". They bring us, to each individual, the guidance from a strategic perspective on what we do in life every day and lead us to the awareness of what we need to do so that development at micro and macro be sustainable. If we each would respect the concept of sustainable development, it would lead to the fact that the needs of the present generation should be met without compromising the ability of future generations to meet their own needs. It is a general objective of the European Union that governs all Union policies and activities. It is about safeguarding the earth's capacity to support life in all its diversity. It is based on principles of democracy, gender equality, solidarity, rule of law and respect for fundamental rights, including freedom and equal opportunities for all. It aims to continuously improve the quality of life and well-being on Earth for present and future generations. To this end, it promotes a dynamic economy with full employment and a high level of education, health protection, social and territorial cohesion and environmental protection in a peaceful and secure world, respecting cultural diversity.

Conclusion:

The European Council in Göteborg (2001) adopted the first EU Sustainable Development Strategy (SDS). This was complemented by an external dimension in 2002 by the European Council in Barcelona and regarding to the World Summit on Sustainable Development in Johannesburg (2002). However, unsustainable trends in climate change and energy use, threats to public health, poverty and social exclusion, demographic pressure and aging, management of natural resources, biodiversity loss, land use and transport still persist and new challenges. Since these negative trends have a sense of urgency, action is needed in the short term, while maintaining a longer term perspective. The main challenge is to gradually change trends and unsustainable patterns of our consumption and production. We are currently witnessing several key challenges, among which are mentioned the following:

1. social inclusion, demography and migration - as an overall goal related to social inclusion we can mention that to create a socially inclusive society must take into account intergenerational solidarity, to ensure and enhance the quality of life of citizens as a precondition for development at the individual level social included and with sustainable welfare. I mention some specific objectives here:
- meeting the EU objective, namely that measures must be taken to have a decisive impact on reducing the number of people at risk of poverty and social exclusion by 2020, with particular emphasis on the need to reduce child poverty;
- Ensuring a high level of social and territorial cohesion at EU level and in Member States, and respect for cultural diversity;
- supporting Member States in their efforts to modernize social protection in view of demographic change;
The significant increase labor market participation of women and older workers according to set targets, as well as increasing employment of migrants by 2020;
- Further development of an EU migration policy, accompanied by policies to strengthen the integration of migrants and their families, taking into account also the economic dimension of migration;
- Reducing the negative effects of globalization on workers and their families;
- Promoting youth employment, intensifying efforts to reduce early school leaving to 10% and to ensure that at least 85% of those aged 22 have completed upper secondary education. By the end of 2016 every young person who has left school and is unemployed should have offered a job, apprenticeship, a form of additional training or other employability measure within six months. The Human Capital OP is a support program for active measures for poverty reduction and

integration of disadvantaged people and orientation active "generation invisible" (in Romania at the end of 2015, the number of people aged 14 to 24 years, according to statistics, was approximately 420,000 youth);
- Increasing labor market participation of persons with disabilities.

The actions should realize in the process of social inclusion, demography and migration, I mention the following: based on new objectives and working methods for social protection and social inclusion, Member States and the Commission continue their cooperation using the open method of coordination (OMC).In this context, the EU and the Member States shall also take necessary steps to rapidly and significantly reduce child poverty and working to provide all children equal opportunities, regardless of their social background, gender or disability; "Social services of general interest", the Commission and Member States continue efforts to ensure that social services contribute actively to social inclusion and cohesion and supports the objectives of growth and employment. Commission and Member States also continues theirs work on further clarification of the impact of Community legislation on social services of general interest; Member States continue implementing the European Youth Pact.

The EU will continue to support the efforts of Member States to modernize the social protection systems and ensure their sustainability. Member States should reduce public debt at a satisfactory pace, raising employment rates and productivity and reforming health care and long-term; Communication on the demographic future of Europe examining how the EU can help Member States address the demographic challenges they face, notably by promoting active strategies aging, reconciling work and family life, better conditions for families taking into account the contribution of immigration; Member States should assess the possible implications of demographic change for land use and resource and energy consumption as well as mobility and take them into account in planning at all levels; EU and Member States continue to develop EU migration policy, accompanied by policies to strengthen the integration of immigrants and their families, particularly through the action plan on migration, including admission procedures. They will intensify cooperation with third countries and joint responses to control migration flows.

2. global poverty and sustainable development challenges - has general objective to actively promote sustainable development worldwide and ensure that internal and external policies of the EU are consistent with global sustainable development and international commitments. Among the objectives and operational targets we can mention the following:
- Significant progress to meet EU commitments to the purposes and objectives agreed at international level, in particular those contained in the Millennium Declaration and those deriving from The World Summit on Sustainable Development in Johannesburg in 2002 and related processes such as Monterrey financing for development, the Doha development Agenda and the Paris Declaration on aid Harmonization;
- Contribute to improving international environmental governance (IEG), in particular in the context of monitoring the 2005 World Summit and to strengthening multilateral environmental agreements (MEAs);
- Increase the volume of aid to 0.7% of gross national income (GNI) by the end of 2016;
- Promoting sustainable development in the context of the WTO negotiations in accordance with the preamble to the Marrakesh Agreement establishing the World Trade Organization which sets sustainable development as one of its main objectives;
- Increase the effectiveness, coherence and quality of aid policies between EU Member States in 2016-2020;
- Supporting sustainable development concerns in all EU external policies, including the Common Security and Defense Policy, making it an objective of multilateral and bilateral development cooperation.

The actions should realize the process on global poverty and sustainable development challenges we mention the following: implementation of the EU "Water for Life", EU Initiative for Energy, for poverty eradication and sustainable development; development of a common EU programming framework, using more joint actions and co- financing of projects, increasing coherence between development and other policies. The quality and effectiveness of aid could be increased through effective budget support, debt reduction and untying of aid; Member States and the Commission should implement the EU strategies on Africa, partnership with the US, Latin America and Pacific.

In this context, the EU should be a partner, working together with its trading partners to improve environmental and social standards and should use the full potential of trade or cooperation agreements at regional or bilateral level to this end; investment by the European Investment Bank and EU - Africa Partnership for Infrastructure should support sustainable development objectives. European Investment Bank should assess its lending to contributing to the achievement of the Millennium Development Goals and sustainable development. Member States and the Commission should cooperate to promote the EU position on transforming the UN Environment Program (UNEP) into a UN specialized agency or UNEO, based in Nairobi with a strengthened mandate and stable funding, adequate and predictable; secure access to financial services is a component of financial inclusion, which proved to be of vital importance for economic and social development and of critical importance in reducing extreme poverty, boosting common prosperity and development support including.

3. Financing and economic instruments - The EU will seek to use the full range of fiscal policy instruments in implementing its policies. The most appropriate economic instruments should be used to promote market transparency and prices that reflect the real economic, social and environmental actual products and services (getting prices right). Their potential to reconcile environmental protection and smart economic growth and exploit win-win opportunities should be recognized. In addition, suitability should be evaluated against a set of criteria, including their impact on competitiveness and productivity. Member States should consider further steps to shift taxation from labor to resource and energy consumption and / or pollution, to contribute to the EU goals of increasing employment and reducing environmental impact in a cost-effective manner. The Commission should present a roadmap for reform, sector by sector, of subsidies that have considerable negative effects on the environment and are incompatible with sustainable development, with a view to gradually eliminating them. To ensure that EU funding should be used in an optimum way to promote sustainable development, Member States and the Commission should coordinate to enhance complementarities and synergies between various strands of Community and other mechanisms for co-financing, as such as cohesion policy, rural development, Life + program for research and technological development (RTD), the competitiveness and innovation Program (CIP) and the European fisheries Fund (EFF).

Abstract

This paper aims at analyzing the evolution over time of the cereal crops, crops which are representative for overall Romania and for each Development Region. The indicators analysis that characterize the cereals production was split across two time periods: 1990-2006 and 2007-2014. It is considered that the period 1990-2006 marked a historic transition for Romania, with deep economic repercussions, following that, immediately with the start of the second period 2007-2014, with the integration into the European Union, to be assessed this change by the overall impact on the economy and default on the agriculture. The analysis by comparison of the two periods was carried out with the help of statistical indicators relating to: the cultivated surfaces evolutions, the total productions and average productions evolutions, as well as their trends for the period 2015-2020.
Cereals production fluctuated greatly. Thus, in the first period 1990-2006 has a coefficient of variation of 21%, while in the second period from 2007 to 2014, has an oscillation of 38%, which is considered by other studies as "a chaotic tendency" as it shows a FTAP project from 2012.
The conclusions resulting from this work suggests that cereals sector development is an essential element for strengthening the economy and ensuring the food security, being responsible for the stability and the availability of internal food products supply.

Keywords : cereal production, statistical indicators, the grain production trend

Introduction

Cereals have been throughout history and are unquestionably the most important sources of plant food for humans and livestock. All of the original ancestors of cereals have been lost over the millennia that they have been cultivated. The development of all the major cereals occurred long before recorded history for all the oldest civilizations were already familiar with several kinds of barley, wheat and other grains(Hill 1952).

The annual growth rate of world demand for cereals fell from 2.5% a year in 1970 and 1.9% per year in the 1980s to only 1% per year in the 1990s. In the 1990s, the decline was accentuated by a number of temporary factors, including serious recessions in the transition countries and some countries in Southeast Asia and East.

The growth rate of demand for cereals is expected to stagnate at 1.2% per year after 2015. In developing countries overall, cereals production is not expected to keep pace with demand. The net cereal deficits of these countries, which amounted 103 million tonnes, or 9% of consumption in 1997-1999 could amount up to 265 million tons by 2030, when they will be 14% of consumption. These gaps can be covered by increasing the traditional grain exporters surplus and new exports from developing countries, which are expected to become from being net importers to net exporters (FAO report, 2002).

Nationally, agriculture is one of the most important branches of the Romanian economy. The share of this sector in GDP was 4.8% in 2015, knowing a slight increase compared to 2014, when it recorded a share of 4.7%, but relating to the start of the period, decreased by about 15 percentage points. Regarding the vegetable sector of agriculture, the crop structure in Romania and crop production is dominated by cereals, areas under these crops representing about 66% of the area cultivated annually. In this context, due to its agricultural favorable resources (fertile arable land), agriculture could return to a much higher GDP and Romania could play an important role in ensuring food security in the European Union by increasing production and cereal sector productivity (Paun I,2012).

Materials and methods

The main indicator of total cereal production is total production in tonnes. In the cereal production analysis it is also used the acreage and average production per hectare. In Romania the main cereals are: wheat, barley and two row barley, maize and sorghum.

The data used in this paper are from the Statistical Yearbook of Romania, published by the National Institute of Statistics and cover the period 1990 to 2014. From the methodological point of view for the two time periods analysis taken into study were used statistical indicators of evolution, extrapolation and correlation: the average and the average main indicators (standard deviation, mean square deviation, coefficient of variation, the average significance , the confidence limits for a given probability), trend line equations of order two and three, the equation significance and the trend extrapolation, the calculation of the Pearson correlation coefficient.

Average $X = \Sigma N_k / k$

The significance of the average and of the equation (Snedecor, 1968), was conducted by comparing t calculated with t theoretical $t_{calc}=(x1-x2)/(S_{(x1-x2)})$, where : the numerator - the samples averages difference and the denominator - the standard error of the difference between averages, a measure of variability within samples.

The Tcal is compared to t theoretical (Ex. GL=23; $+t_{teor}$ (0.001: 3.76; 0.01 : 2.81; 0.05: 2.07); N: not significant)
As statistical indicators were calculated : the average for some periods of time , comparison indicators with fixed base and chained base and the annual growth rhythm = $r_{2000-2012} = \sqrt[12]{\prod (p1/p0)} - 1$; where :
$\prod$p1/po = the chain indicators product for the analyzed period.
For the mean square deviation and standard deviation (σ) it is calculated as a square average form the deviation of all series elements form their arithmetic mean.

$$\sigma = \sqrt{\frac{\sum (x_i - \overline{x})^2}{n}}$$

The mean square deviation is a basis indicator , that is used in the variation analysis and the errors selection estimation in the correlation calculation.
The variation coefficient (ν) is calculated as a report between the mean square deviation and the arithmetic mean.. It is expressed as a percentage:

$$\nu = \frac{\sigma}{\overline{x}} \cdot 100$$

The variation coefficient significance. As its value is close to zero the variation is weaker so the community is homogeneous, the average having a high degree of representativeness. If the he value of coefficient is bigger, the variation is more intense, more heterogeneous the community is and the average has a low level significance. It is estimated that at a rate of more than 35-40%, the average is no longer representative and the data must be separated into a series of components, groups, depending on the variation of other grouping characteristics.

The calculation equation and the trend extrapolation. One of the most used methods in finding the trend is adjusting the data series. By adjusting operation are obtained calculated time series, highlighting the trends and replacing empirical series.

A widely used method is adjusting using equations according to time: linear , $Y = a + bt$; second degree , $Y = a + bt + ct^2$; third degree, $Y = a + bt + ct^2+dt^3$ etc. As in the case of correlation, for finding the regression function parameters necessary to series adjustment is applied the least squares method: $\Sigma(yi - Yti)^2 = \min$ (Anghelache, 2012).

Confidence limits for a giver probability = X+/- σ* tp (transgression probability calculated based on the degrees of freedom and risk).
In determining the significance of the equations trend it was used the **Pearson correlation coefficient**:

$$r = \frac{N\sum xy - \left(\sum x\right)\left(\sum y\right)}{\sqrt{N\sum x^2 - \left(\sum x\right)^2} * \sqrt{N\sum y^2 - \left(\sum y\right)^2}}$$

Results and discussions

The statistical indicators interpretation of cereal production for the analyzed periods were gradually realized, thus:

- Statistical indicators of total cereals production at country level and by Development Regions
- Statistical indicators of cereals cultivated surfaces at country level and by Development Regions
- Statistical indicators of cereals average productions at country level and by Development Regions
- Statistical trend indicators of cereals production at country level and by Development Regions
    - Statistical trend indicators of total cereals production
    - Statistical trend indicators of cereals cultivated surfaces
    - Statistical trend indicators of cereals average productions
- The annual growth rate and the correlation between total productions, average productions and cultivated surfaces.

Based on the analysis by comparison of the two time periods, they were made plausible scenarios on the evolution of the cultivated surfaces, total and average productions for the period 2015-2020.

The statistical indicators interpretation of cereal production

1. *Statistical indicators of total cereals production at country level and by Development Regions*
The total cereals production analysis at the country level and by development region was achieved in two periods, the first covering the years 1990-2006 respectively, and the second since joining the European Union by 2014 (Tables 1 and 2 respectively).

In the first period, total cereals production at the country level recorded a minimum of 10,477 million tons and a maximum of 24,403 million tons, with an increasing annual rate 0.8% and a coefficient of variation of 21%, which means a large data oscillation.

Source: Own calculation based on data from INSSE and Romania Statistical Yearbook, series of time

During this period, from the 8 regions of the country, only three registered increases in total production in 2006 compared to 1990, ie by 12.5% the West Region, South East with 1.7% and North-East by 0.5%. Of the eight regions of Romania, we observe the South-Muntenia Region with a largest area with fertile land and favorable climate for the grain crops. The South-Muntenia Region had the highest total production with an average of 3.8298 million tonnes in 2006, but registering a production 22.5% lower compared to 2006. The region with the lowest production is as we expect, Bucharest-Ilfov Region, agricultural land is a at a smaller share in this area, and this decrease from 244 thousand tons to 177 thousand tons, is of course due to lower acreage.

Source: Own calculation based on data from INSSE and Romania Statistical Yearbook, series of time

In the second period, 2007-2014, total grain production at the country level increases until the period final, with an annual growth rhythm of 0.8%. During this period all developing regions recorded increases in total grain production, the most significant being in South-West Oltenia, South-East and North-East, as evidenced by statistical data analysis in Table 2. It is noteworthy the year 2007 compared to other years, as it was a year with very low yields, this being due to environmental conditions, the drought in that year disfavored crop field productions.

Table 3 The total cereals production evolution at the country level and by Development Regions , for the period 1990-2006 and 2007-2014

*t_{teor} (0.001: 3.76; 0.01: 2.81; 0.05: 2.07); N: not significant; GL=23 (liberty degree)

Comparing the two analyzed periods (Table 3), we see that both for the country and for the regions have large reductions in the period 2007-2014 average compared to the average of 1990-2006. At the country level is a decrease of 292.5 thousand tons, but the highest decrease is observed in the South-West Oltenia, 315.6 thousand tons. There are also increases in two of the regions, South-East and South-Muntenia, where the average of the second period is higher by 178.2 thousand tons and 217.3 thousand tons respectively, from the first period analyzed. Moreover in the two regions it is most part of arable land known for the fertility and natural conditions that help achieve significant productions.
